

Features

- Single Voltage Operation Read/Write: 2.65V - 3.6V
- 2.7V - 3.6V Read/Write
- Access Time – 70 ns
- Sector Erase Architecture
 - One Hundred Twenty-seven 32K Word Main Sectors with Individual Write Lockout
 - Eight 4K Word Sectors with Individual Write Lockout
- Fast Word Program Time – 10 μ s
- Typical Sector Erase Time: 32K Word Sectors – 500 ms; 4K Word Sectors – 100 ms
- Suspend/Resume Feature for Erase and Program
 - Supports Reading and Programming Data from Any Sector by Suspending Erase of a Different Sector
 - Supports Reading Any Word by Suspending Programming of Any Other Word
- Low-power Operation
 - 10 mA Active
 - 15 μ A Standby
- $\overline{\text{Data}}$ Polling and Toggle Bit for End of Program Detection
- VPP Pin for Write Protection and Accelerated Program Operations
- $\overline{\text{RESET}}$ Input for Device Initialization
- Sector Lockdown Support
- TSOP Package
- Top or Bottom Boot Block Configuration Available
- 128-bit Protection Register
- Common Flash Interface (CFI)
- Green (Pb/Halide-free) Packaging

1. Description

The AT49BV642D(T) is a 2.7-volt 64-megabit Flash memory organized as 4,194,304 words of 16 bits each. The memory is divided into 135 sectors for erase operations. The device can be read or reprogrammed off a single 2.7V power supply, making it ideally suited for in-system programming.

To increase the flexibility of the device, it contains an Erase Suspend and Program Suspend feature. This feature will put the erase or program on hold for any amount of time and let the user read data from or program data to any of the remaining sectors. The end of program or erase is detected by $\overline{\text{Data}}$ Polling or toggle bit.

The VPP pin provides data protection and faster programming times. When the V_{PP} input is below 0.4V, the program and erase functions are inhibited. When V_{PP} is at 1.65V or above, normal program and erase operations can be performed. With V_{PP} at 10.0V, the program (dual-word program command) operation is accelerated.

A six-word command (Enter Single Pulse Program Mode) to remove the requirement of entering the three-word program sequence is offered to further improve programming time. After entering the six-word code, only single pulses on the write control lines are required for writing into the device. This mode (Single Pulse Word Program) is exited by powering down the device, by taking the $\overline{\text{RESET}}$ pin to GND or by a high-to-low transition on the V_{PP} input. Erase, Erase Suspend/Resume, Program Suspend/Resume and Read Reset commands will not work while in this mode; if entered they will result in data being programmed into the device. It is not recommended that the six-word code reside in the software of the final product but only exist in external programming code.

2. Pin Configurations

Pin Name	Pin Function
I/O0 - I/O15	Data Inputs/Outputs
A0 - A21	Addresses
\overline{CE}	Chip Enable
\overline{OE}	Output Enable
\overline{WE}	Write Enable
\overline{RESET}	Reset
VPP	Write Protection and Power Supply for Accelerated Program Operations
VCCQ	Output Power Supply

2.1 TSOP Top View (Type 1)

3. Device Operation

3.1 Command Sequences

The device powers on in the read mode. Command sequences are used to place the device in other operating modes such as program and erase. After the completion of a program or an erase cycle, the device enters the read mode. The command sequences are written by applying a low pulse on the \overline{WE} input with \overline{CE} low and \overline{OE} high or by applying a low-going pulse on the \overline{CE} input with \overline{WE} low and \overline{OE} high. The address is latched on the falling edge of the \overline{WE} or \overline{CE} pulse whichever occurs first. Valid data is latched on the rising edge of the \overline{WE} or the \overline{CE} pulse, whichever occurs first. The addresses used in the command sequences are not affected by entering the command sequences.

3.2 Read

The AT49BV642D(T) is accessed like an EPROM. When \overline{CE} and \overline{OE} are low and \overline{WE} is high, the data stored at the memory location determined by the address pins are asserted on the outputs. The outputs are put in the high impedance state whenever \overline{CE} or \overline{OE} is high. This dual-line control gives designers flexibility in preventing bus contention.

3.3 Reset

A \overline{RESET} input pin is provided to ease some system applications. When \overline{RESET} is at a logic high level, the device is in its standard operating mode. A low level on the \overline{RESET} pin halts the present device operation and puts the outputs of the device in a high-impedance state. When a high level is reasserted on the \overline{RESET} pin, the device returns to read or standby mode, depending upon the state of the control pins.

3.4 Erase

Before a word can be reprogrammed it must be erased. The erased state of the memory bits is a logical "1". The entire memory can be erased by using the Chip Erase command or individual sectors can be erased by using the Sector Erase command.

3.4.1 Chip Erase

Chip Erase is a six-bus cycle operation. The automatic erase begins on the rising edge of the last \overline{WE} pulse. Chip Erase does not alter the data of the protected sectors. After the full chip erase the device will return back to the read mode. The hardware reset during Chip Erase will stop the erase but the data will be of unknown state. Any command during Chip Erase except Erase Suspend will be ignored.

3.4.2 Sector Erase

As an alternative to a full chip erase, the device is organized into multiple sectors that can be individually erased. The Sector Erase command is a six-bus cycle operation. The sector whose address is valid at the sixth falling edge of \overline{WE} will be erased provided the given sector has not been protected.

3.5 Word Programming

The device is programmed on a word-by-word basis. Programming is accomplished via the internal device command register and is a four-bus cycle operation. The programming address and data are latched in the fourth cycle. The device will automatically generate the required internal programming pulses. Please note that a “0” cannot be programmed back to a “1”; only erase operations can convert “0”s to “1”s.

3.6 Sector Lockdown

Each sector has a programming lockdown feature. This feature prevents programming of data in the designated sectors once the feature has been enabled. These sectors can contain secure code that is used to bring up the system. Enabling the lockdown feature will allow the boot code to stay in the device while data in the rest of the device is updated. This feature does not have to be activated; any sector’s usage as a write-protected region is optional to the user.

At power-up or reset, all sectors are unlocked. To activate the lockdown for a specific sector, the six-bus cycle Sector Lockdown command must be issued. Once a sector has been locked down, the contents of the sector is read-only and cannot be erased or programmed.

3.6.1 Sector Lockdown Detection

A software method is available to determine if programming of a sector is locked down. When the device is in the software product identification mode (see [“Software Product Identification Entry/Exit”](#) sections on [page 23](#)), a read from address location 00002H within a sector will show if programming the sector is locked down. If the data on I/O0 is low, the sector can be programmed; if the data on I/O0 is high, the program lockdown feature has been enabled and the sector cannot be programmed. The software product identification exit code should be used to return to standard operation.

3.6.2 Sector Lockdown Override

The only way to unlock a sector that is locked down is through reset or power-up cycles. After power-up or reset, the content of a sector that is locked down can be erased and reprogrammed.

3.7 Program/Erase Status

The device provides several bits to determine the status of a program or erase operation: I/O2, I/O3, I/O5, I/O6, and I/O7. All other status bits are don’t care. The [“Status Bit Table”](#) on [page 10](#) and the following four sections describe the function of these bits. To provide greater flexibility for system designers, the AT49BV642D(T) contains a programmable configuration register. The configuration register allows the user to specify the status bit operation. The configuration register can be set to one of two different values, “00” or “01”. If the configuration register is set to “00”, the part will automatically return to the read mode after a successful program or erase operation. If the configuration register is set to a “01”, a Product ID Exit command must be given after a successful program or erase operation before the part will return to the read mode. It is important to note that whether the configuration register is set to a “00” or to a “01”, any unsuccessful program or erase operation requires using the Product ID Exit command to return the device to read mode. The default value (after power-up) for the configuration register is “00”. Using the four-bus cycle set configuration register command as shown in the [“Command Definition Table”](#) on [page 11](#), the value of the configuration register can be changed. Voltages applied to the reset pin will not alter the value of the configuration register. The value of the configuration register will affect the operation of the I/O7 status bit as described below.

3.7.1 $\overline{\text{Data}}$ Polling

The AT49BV642D(T) features $\overline{\text{Data}}$ Polling to indicate the end of a program cycle. If the status configuration register is set to a “00”, during a program cycle an attempted read of the last word loaded will result in the complement of the loaded data on I/O7. Once the program cycle has been completed, true data is valid on all outputs and the next cycle may begin. During a chip or sector erase operation, an attempt to read the device will give a “0” on I/O7. Once the program or erase cycle has completed, true data will be read from the device. $\overline{\text{Data}}$ Polling may begin at any time during the program cycle. Please see “[Status Bit Table](#)” on [page 10](#) for more details.

If the status bit configuration register is set to a “01”, the I/O7 status bit will be low while the device is actively programming or erasing data. I/O7 will go high when the device has completed a program or erase operation. Once I/O7 has gone high, status information on the other pins can be checked.

The $\overline{\text{Data}}$ Polling status bit must be used in conjunction with the erase/program and V_{PP} status bit as shown in the algorithm in [Figures 3-1 and 3-2](#) on [page 8](#).

3.7.2 Toggle Bit

In addition to $\overline{\text{Data}}$ Polling, the AT49BV642D(T) provides another method for determining the end of a program or erase cycle. During a program or erase operation, successive attempts to read data from the memory will result in I/O6 toggling between one and zero. Once the program cycle has completed, I/O6 will stop toggling and valid data will be read. Examining the toggle bit may begin at any time during a program cycle. Please see “[Status Bit Table](#)” on [page 10](#) for more details.

The toggle bit status bit should be used in conjunction with the erase/program and V_{PP} status bit as shown in the algorithm in [Figures 3-3 and 3-4](#) on [page 9](#).

3.7.3 Erase/Program Status Bit

The device offers a status bit on I/O5 that indicates whether the program or erase operation has exceeded a specified internal pulse count limit. If the status bit is a “1”, the device is unable to verify that an erase or a word program operation has been successfully performed. The device may also output a “1” on I/O5 if the system tries to program a “1” to a location that was previously programmed to a “0”. Only an erase operation can change a “0” back to a “1”. If a program (Sector Erase) command is issued to a protected sector, the protected sector will not be programmed (erased). The device will go to a status read mode and the I/O5 status bit will be set high, indicating the program (erase) operation did not complete as requested. Once the erase/program status bit has been set to a “1”, the system must write the Product ID Exit command to return to the read mode. The erase/program status bit is a “0” while the erase or program operation is still in progress. Please see “[Status Bit Table](#)” on [page 10](#) for more details.

3.7.4 VPP Status Bit

The AT49BV642D(T) provides a status bit on I/O3 that provides information regarding the voltage level of the VPP pin. During a program or erase operation, if the voltage on the VPP pin is not high enough to perform the desired operation successfully, the I/O3 status bit will be a “1”. Once the V_{PP} status bit has been set to a “1”, the system must write the Product ID Exit command to return to the read mode. On the other hand, if the voltage level is high enough to perform a program or erase operation successfully, the V_{PP} status bit will output a “0”. Please see “[Status Bit Table](#)” on [page 10](#) for more details.

3.8 Erase Suspend/Erase Resume

The Erase Suspend command allows the system to interrupt a sector erase operation and then program or read data from a different sector within the memory. After the Erase Suspend command is given, the device requires a maximum time of 15 μ s to suspend the erase operation. After the erase operation has been suspended, the system can then read data or program data to any other sector within the device. An address is not required during the Erase Suspend command. During a sector erase suspend, another sector cannot be erased. To resume the sector erase operation, the system must write the Erase Resume command. The Erase Resume command is a one-bus cycle command. The device also supports an erase suspend during a complete chip erase. While the chip erase is suspended, the user can read from any sector within the memory that is protected. The command sequence for a chip erase suspend and a sector erase suspend are the same.

3.9 Program Suspend/Program Resume

The Program Suspend command allows the system to interrupt a programming operation and then read data from a different word within the memory. After the Program Suspend command is given, the device requires a maximum of 10 μ s to suspend the programming operation. After the programming operation has been suspended, the system can then read from any other word within the device. An address is not required during the program suspend operation. To resume the programming operation, the system must write the Program Resume command. The program suspend and resume are one-bus cycle commands. The command sequence for the erase suspend and program suspend are the same, and the command sequence for the erase resume and program resume are the same.

3.10 128-Bit Protection Register

The AT49BV642D(T) contains a 128-bit register that can be used for security purposes in system design. The protection register is divided into two 64-bit blocks. The two blocks are designated as block A and block B. The data in block A is non-changeable and is programmed at the factory with a unique number. The data in block B is programmed by the user and can be locked out such that data in the block cannot be reprogrammed. To program block B in the protection register, the four-bus cycle Program Protection Register command must be used as shown in the [“Command Definition Table” on page 11](#). To lock out block B, the four-bus cycle lock protection register command must be used as shown in the Command Definition table. Data bit D1 must be zero during the fourth bus cycle. All other data bits during the fourth bus cycle are don't cares. To determine whether block B is locked out, the status of Block B Protection command is given. If data bit D1 is zero, block B is locked. If data bit D1 is one, block B can be reprogrammed. Please see the [“Protection Register Addressing Table” on page 12](#) for the address locations in the protection register. To read the protection register, the Product ID Entry command is given followed by a normal read operation from an address within the protection register. After determining whether block B is protected or not or reading the protection register, the Product ID Exit command must be given prior to performing any other operation.

3.11 Common Flash Interface (CFI)

Common Flash Interface (CFI) is a published, standardized data structure that may be read from a Flash device. CFI allows system software to query the installed device to determine the configurations, various electrical and timing parameters, and functions supported by the device. CFI is used to allow the system to learn how to interface to the Flash device most optimally. The two primary benefits of using CFI are ease of upgrading and second source availability. The command to enter the CFI Query mode is a one-bus cycle command which requires writing data 98h to address 55h. The CFI Query command can be written when the device is ready to read data or can also be written when the part is in the product ID mode. Once in the CFI Query mode, the system can read CFI data at the addresses given in the [“Common Flash Interface Definition Table” on page 24](#). To exit the CFI Query mode, the product ID exit command must be given.

3.12 Hardware Data Protection

Hardware features protect against inadvertent programs to the AT49BV642D(T) in the following ways: (a) V_{CC} sense: if V_{CC} is below 1.8V (typical), the program function is inhibited. (b) V_{CC} power-on delay: once V_{CC} has reached the V_{CC} sense level, the device will automatically time-out 10 ms (typical) before programming. (c) Program inhibit: holding any one of \overline{OE} low, \overline{CE} high or \overline{WE} high inhibits program cycles. (d) V_{PP} is less than V_{ILPP} .

3.13 Input Levels

While operating with a 2.65V to 3.6V power supply, the address inputs and control inputs (\overline{OE} , \overline{CE} and \overline{WE}) may be driven from 0 to 5.5V without adversely affecting the operation of the device. The I/O lines can be driven from 0 to $V_{CCQ} + 0.6V$.

3.14 Output Levels

For the AT49BV642D(T), output high levels are equal to $V_{CCQ} - 0.1V$ (not V_{CC}). For 2.65V to 3.6V output levels, V_{CCQ} must be tied to V_{CC} .

Figure 3-1. $\overline{\text{Data}}$ Polling Algorithm
(Configuration Register = 00)

Figure 3-2. $\overline{\text{Data}}$ Polling Algorithm
(Configuration Register = 01)

Note: 1. VA = Valid address for programming. During a sector erase operation, a valid address is any sector address within the sector being erased. During chip erase, a valid address is any non-protected sector address.

- Notes:
1. VA = Valid address for programming. During a sector erase operation, a valid address is any sector address within the sector being erased. During chip erase, a valid address is any non-protected sector address.
 2. I/O7 should be rechecked even if I/O5 = "1" because I/O7 may change simultaneously with I/O5.

Figure 3-3. Toggle Bit Algorithm
(Configuration Register = 00)

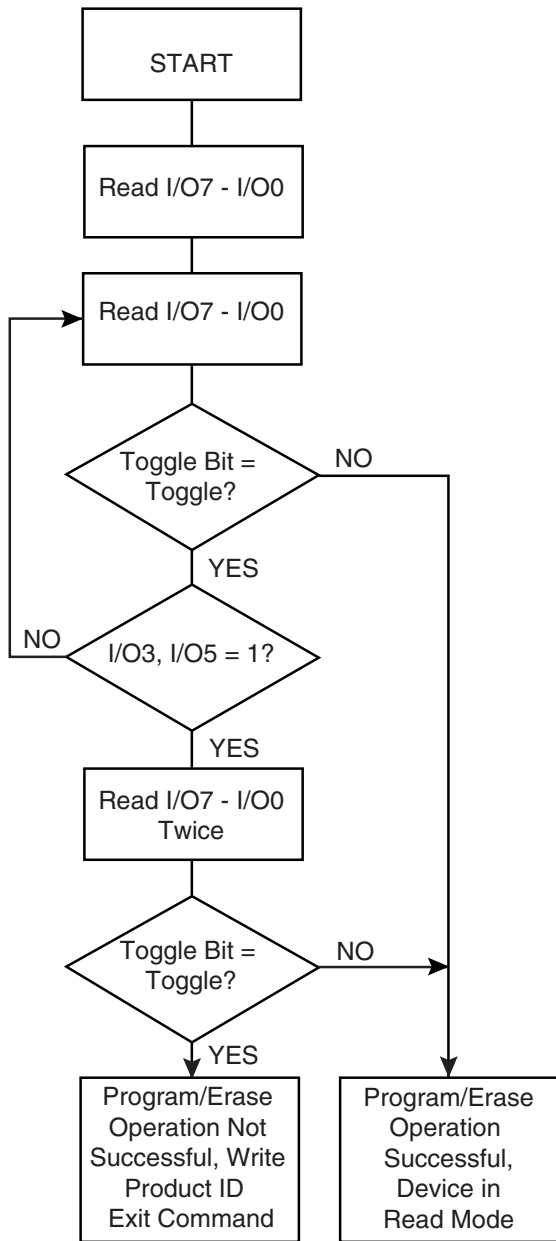

Figure 3-4. Toggle Bit Algorithm
(Configuration Register = 01)

Note: 1. The system should recheck the toggle bit even if I/O5 = "1" because the toggle bit may stop toggling as I/O5 changes to "1".

Note: 1. The system should recheck the toggle bit even if I/O5 = "1" because the toggle bit may stop toggling as I/O5 changes to "1".

4. Status Bit Table

Configuration Register	Status Bit					
	I/O7	I/O7	I/O6	I/O5 ⁽¹⁾	I/O3 ⁽²⁾	I/O2
	00	01	00/01	00/01	00/01	00/01
Programming	$\overline{I/O7}$	0	TOGGLE	0	0	1
Erasing	0	0	TOGGLE	0	0	TOGGLE
Erase Suspended & Read Erasing Sector	1	1	1	0	0	TOGGLE
Erase Suspended & Read Non-erasing Sector	DATA	DATA	DATA	DATA	DATA	DATA
Erase Suspended & Program Non-erasing Sector	$\overline{I/O7}$	0	TOGGLE	0	0	TOGGLE
Erase Suspended & Program Suspended and Reading from Non-suspended Sectors	DATA	DATA	DATA	DATA	DATA	DATA
Program Suspended & Read Programming Sector	I/O7	1	1	0	0	TOGGLE
Program Suspended & Read Non-programming Sector	DATA	DATA	DATA	DATA	DATA	DATA

- Notes:
1. I/O5 switches to a "1" when a program or an erase operation has exceeded the maximum time limits or when a program or sector erase operation is performed on a protected sector.
 2. I/O3 switches to a "1" when the V_{PP} level is not high enough to successfully perform program and erase operations.

5. Command Definition Table

Command Sequence	Bus Cycles	1st Bus Cycle		2nd Bus Cycle		3rd Bus Cycle		4th Bus Cycle		5th Bus Cycle		6th Bus Cycle	
		Addr	Data	Addr	Data	Addr	Data	Addr	Data	Addr	Data	Addr	Data
Read	1	Addr	D _{OUT}										
Chip Erase	6	555	AA	AAA ⁽²⁾	55	555	80	555	AA	AAA	55	555	10
Sector Erase	6	555	AA	AAA	55	555	80	555	AA	AAA	55	SA ⁽³⁾	30
Word Program	4	555	AA	AAA	55	555	A0	Addr	D _{IN}				
Dual-Word Program ⁽⁴⁾	5	555	AA	AAA	55	555	E0	Addr0	D _{IN0}	Addr1	D _{IN1}		
Enter Single-pulse Program Mode	6	555	AA	AAA	55	555	80	555	AA	AAA	55	555	A0
Single-pulse Word Program Mode	1	Addr	D _{IN}										
Sector Lockdown ⁽⁵⁾	6	555	AA	AAA	55	555	80	555	AA	AAA	55	SA ^(3/5)	60
Erase/Program Suspend	1	xxx	B0										
Erase/Program Resume	1	xxx	30										
Product ID Entry ⁽⁶⁾	3	555	AA	AAA	55	555	90						
Product ID Exit ⁽⁷⁾	3	555	AA	AAA	55	555	F0 ⁽⁸⁾						
Product ID Exit ⁽⁷⁾	1	xxx	F0 ⁽⁸⁾										
Program Protection Register – Block B	4	555	AA	AAA	55	555	C0	Addr ⁽⁹⁾	D _{IN}				
Lock Protection Register – Block B	4	555	AA	AAA	55	555	C0	80	X0				
Status of Block B Protection	4	555	AA	AAA	55	555	90	80	D _{OUT} ⁽¹⁰⁾				
Set Configuration Register	4	555	AA	AAA	55	555	D0	xxx	00/01 ⁽¹¹⁾				
CFI Query	1	X55	98										

- Notes:
- The DATA FORMAT in each bus cycle is as follows: I/O15 - I/O8 (Don't Care); I/O7 - I/O0 (Hex). The ADDRESS FORMAT in each bus cycle is as follows: A11 - A0 (Hex), A11 - A21 (Don't Care).
 - Since A11 is a Don't Care, AAA can be replaced with 2AA.
 - SA = sector address. Any word address within a sector can be used to designate the sector address (see pages 13 - 16 for details).
 - The fast programming option enables the user to program two words in parallel only when V_{pp} = 10V. The addresses, Addr0 and Addr1, of the two words, D_{IN0} and D_{IN1}, must only differ in address A0. This command should be used for manufacturing purpose only.
 - Once a sector is in the lockdown mode, the data in the protected sector cannot be changed, unless the chip is reset or power cycled.
 - During the fourth bus cycle, the manufacturer code is read from address 00000H, the device code is read from address 00001H, and the data in the protection register is read from addresses 000081H - 000088H.
 - Either one of the Product ID Exit commands can be used.
 - Bytes of data other than F0 may be used to exit the product ID mode. However, it is recommended that F0 be used.
 - Any address within the user programmable register region. Please see "Protection Register Addressing Table" on page 12.
 - If data bit D1 is "0", block B is locked. If data bit D1 is "1", block B can be reprogrammed.
 - The default state (after power-up) of the configuration register is "00".

6. Absolute Maximum Ratings*

Temperature under Bias	-55°C to +125°C
Storage Temperature	-65°C to +150°C
All Input Voltages Except V_{PP} (including NC Pins) with Respect to Ground	-0.6V to +6.25V
V_{PP} Input Voltage with Respect to Ground	0V to 10.0V
All Output Voltages with Respect to Ground	-0.6V to $V_{CCQ} + 0.6V$

*NOTICE: Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

7. Protection Register Addressing Table

Word	Use	Block	A7	A6	A5	A4	A3	A2	A1	A0
0	Factory	A	1	0	0	0	0	0	0	1
1	Factory	A	1	0	0	0	0	0	1	0
2	Factory	A	1	0	0	0	0	0	1	1
3	Factory	A	1	0	0	0	0	1	0	0
4	User	B	1	0	0	0	0	1	0	1
5	User	B	1	0	0	0	0	1	1	0
6	User	B	1	0	0	0	0	1	1	1
7	User	B	1	0	0	0	1	0	0	0

Note: All address lines not specified in the above table must be “0” when accessing the protection register, i.e. A21 -A8 = 0.

8. Memory Organization – AT49BV642D

Sector	Size (Words)	x16 Address Range (A21 - A0)

10. DC and AC Operating Range

		AT49BV642D(T) - 70
Operating Temperature (Case)	Industrial	-40°C - 85°C
V _{CC} Power Supply		2.7V - 3.6V

11. Operating Modes

Mode	\overline{CE}	\overline{OE}	\overline{WE}	RESET	V _{PP} ⁽¹⁾	Ai	I/O
Read	V _{IL}	V _{IL}	V _{IH}	V _{IH}	X ⁽²⁾	Ai	D _{OUT}
Program/Erase ⁽³⁾	V _{IL}	V _{IH}	V _{IL}	V _{IH}	V _{IHPP} ⁽⁴⁾	Ai	D _{IN}
Standby/Program Inhibit	V _{IH}	X ⁽²⁾	X	V _{IH}	X	X	High Z
Program Inhibit	X	X	V _{IH}	V _{IH}	X		
	X	V _{IL}	X	V _{IH}	X		
	X	X	X	X	V _{ILPP} ⁽⁵⁾		
Output Disable	X	V _{IH}	X	V _{IH}	X		High Z
Reset	X	X	X	V _{IL}	X	X	High Z
Software Product Identification				V _{IH}		A0 = V _{IL} , A1 - A21 = V _{IL}	Manufacturer Code ⁽⁶⁾
						A0 = V _{IH} , A1 - A21 = V _{IL}	Device Code ⁽⁶⁾

- Notes:
1. The VPP pin can be tied to V_{CC}. For faster program operations, V_{PP} can be set to 9.5V ± 0.5V.
 2. X can be V_{IL} or V_{IH}.
 3. Refer to program cycle waveforms on [page 21](#).
 4. V_{IHPP} (min) = 1.65V.
 5. V_{ILPP} (max) = 0.4V.
 6. Manufacturer Code: 001FH; Device Code: 01D6H - AT49BV642D; 01D2H - AT49BV642DT.

12. DC Characteristics

Symbol	Parameter	Condition	Min	Typ	Max	Units
I_{LI}	Input Load Current	$V_{IN} = 0V$ to V_{CC}			2	μA
I_{LO}	Output Leakage Current	$V_{I/O} = 0V$ to V_{CC}			2	μA
I_{SB}	V_{CC} Standby Current CMOS	$\overline{CE} = V_{CCQ} - 0.3V$ to V_{CC}		15	25	μA
$I_{CC}^{(1)}$	V_{CC} Active Read Current	$f = 5$ MHz; $I_{OUT} = 0$ mA		10	15	mA
I_{CC1}	V_{CC} Programming Current				25	mA
V_{IL}	Input Low Voltage				0.6	V
V_{IH}	Input High Voltage		$V_{CCQ} - 0.6$			V
V_{OL}	Output Low Voltage	$I_{OL} = 2.1$ mA			0.45	V
V_{OH}	Output High Voltage	$I_{OH} = -100$ μA	$V_{CCQ} - 0.1$			V

Note: 1. In the erase mode, I_{CC} is 25 mA.

13. Input Test Waveforms and Measurement Level

14. Output Test Load

15. Pin Capacitance

$f = 1$ MHz, $T = 25^\circ C^{(1)}$

	Typ	Max	Units	Conditions
C_{IN}	4	6	pF	$V_{IN} = 0V$
C_{OUT}	8	12	pF	$V_{OUT} = 0V$

Note: 1. This parameter is characterized and is not 100% tested.

16. AC Read Characteristics

Symbol	Parameter	Min	Max	Units
t_{RC}	Read Cycle Time	70		ns
t_{ACC}	Access, Address to Data Valid		70	ns
t_{CE}	Access, \overline{CE} to Data Valid		70	ns
t_{OE}	\overline{OE} to Data Valid		20	ns
t_{DF}	\overline{CE} , \overline{OE} High to Data Float		25	ns
t_{OH}	Output Hold from \overline{OE} , \overline{CE} or Address, whichever Occurs First	0		ns
t_{RO}	\overline{RESET} to Output Delay		100	ns

17. Asynchronous Read Cycle Waveform⁽¹⁾⁽²⁾⁽³⁾

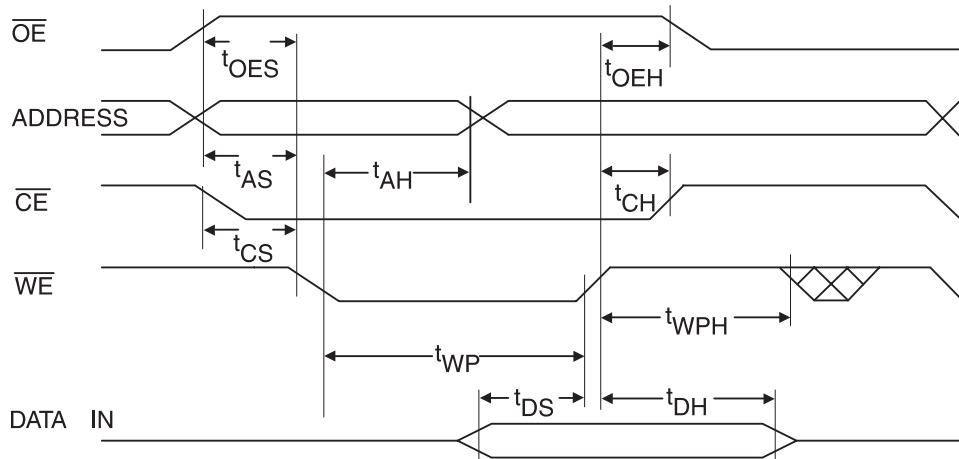

- Notes:
- \overline{CE} may be delayed up to $t_{ACC} - t_{CE}$ after the address transition without impact on t_{ACC} .
 - \overline{OE} may be delayed up to $t_{CE} - t_{OE}$ after the falling edge of \overline{CE} without impact on t_{CE} or by $t_{ACC} - t_{OE}$ after an address change without impact on t_{ACC} .
 - t_{DF} is specified from \overline{OE} or \overline{CE} , whichever occurs first (CL = 5 pF).

18. AC Word Load Characteristics

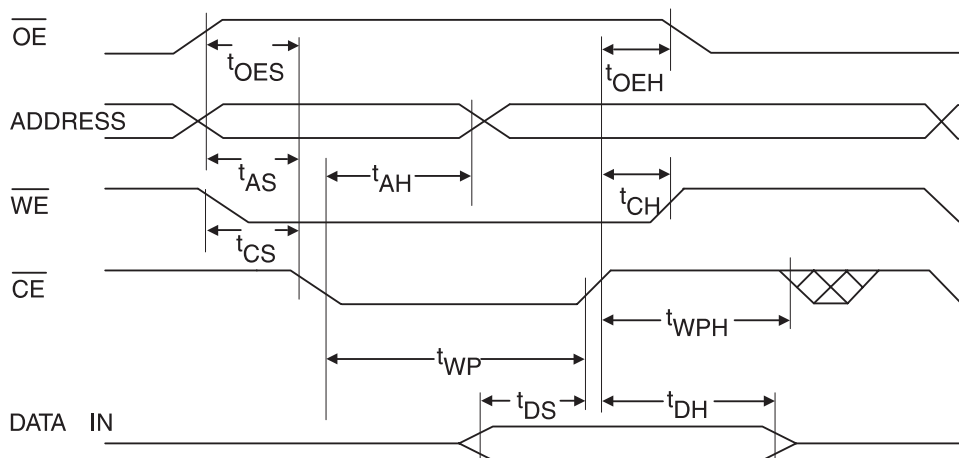

Symbol	Parameter	Min	Max	Units
t_{AS}, t_{OES}	Address, \overline{OE} Setup Time	0		ns
t_{AH}	Address Hold Time	25		ns
t_{CS}	Chip Select Setup Time	0		ns
t_{CH}	Chip Select Hold Time	0		ns
t_{WP}	Write Pulse Width (\overline{WE} or \overline{CE})	25		ns
t_{WPH}	Write Pulse Width High	15		ns
t_{DS}	Data Setup Time	25		ns
t_{DH}, t_{OEH}	Data, \overline{OE} Hold Time	0		ns

19. AC Word Load Waveforms

19.1 \overline{WE} Controlled

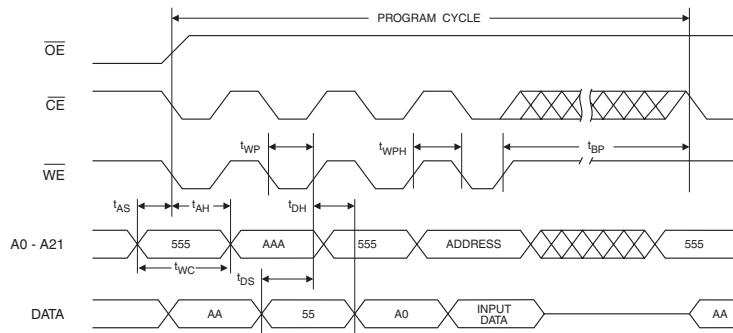

19.2 \overline{CE} Controlled

20. Program Cycle Characteristics

Symbol	Parameter	Min	Typ	Max	Units
t_{BP}	Word Programming Time		10	120	μs
t_{BPD}	Word Programming Time in Dual Programming Mode		5	60	μs
t_{AS}	Address Setup Time	0			ns
t_{AH}	Address Hold Time	25			ns
t_{DS}	Data Setup Time	25			ns
t_{DH}	Data Hold Time	0			ns
t_{WP}	Write Pulse Width	25			ns
t_{WPH}	Write Pulse Width High	15			ns
t_{WC}	Write Cycle Time	70			ns
t_{RP}	$\overline{\text{Reset}}$ Pulse Width	500			ns
t_{EC}	Chip Erase Cycle Time		64		seconds
t_{SEC1}	Sector Erase Cycle Time (4K Word Sectors)		0.1	2.0	seconds
t_{SEC2}	Sector Erase Cycle Time (32K Word Sectors)		0.5	6.0	seconds
t_{ES}	Erase Suspend Time			15	μs
t_{PS}	Program Suspend Time			10	μs

21. Program Cycle Waveforms

22. Sector or Chip Erase Cycle Waveforms

- Notes:
- $\overline{\text{OE}}$ must be high only when $\overline{\text{WE}}$ and $\overline{\text{CE}}$ are both low.
 - For chip erase, the address should be 555. For sector erase, the address depends on what sector is to be erased. (See note 3 under "Command Definition Table" on page 11.)
 - For chip erase, the data should be 10H, and for sector erase, the data should be 30H.

23. Data Polling Characteristics

Symbol	Parameter	Min	Typ	Max	Units
t_{DH}	Data Hold Time	10			ns
$t_{OE\overline{H}}$	\overline{OE} Hold Time	10			ns
t_{OE}	\overline{OE} to Output Delay ⁽²⁾				ns
t_{WR}	Write Recovery Time	0			ns

Notes: 1. These parameters are characterized and not 100% tested.
2. See t_{OE} spec on [page 19](#).

24. Data Polling Waveforms

25. Toggle Bit Characteristics⁽¹⁾

Symbol	Parameter	Min	Typ	Max	Units
t_{DH}	Data Hold Time	10			ns
$t_{OE\overline{H}}$	\overline{OE} Hold Time	10			ns
t_{OE}	\overline{OE} to Output Delay ⁽²⁾				ns
t_{OEHP}	\overline{OE} High Pulse	50			ns
t_{WR}	Write Recovery Time	0			ns

Notes: 1. These parameters are characterized and not 100% tested.
2. See t_{OE} spec on [page 19](#).

26. Toggle Bit Waveforms⁽¹⁾⁽²⁾⁽³⁾

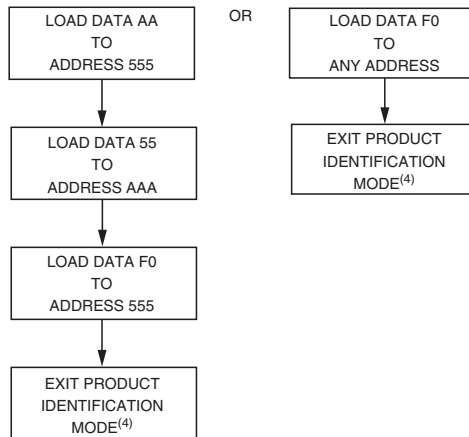

Notes: 1. Toggling either \overline{OE} or \overline{CE} or both \overline{OE} and \overline{CE} will operate toggle bit. The t_{OEHP} specification must be met by the toggling input(s).
2. Beginning and ending state of I/O6 will vary.
3. Any address location may be used but the address should not vary.

27. Software Product Identification Entry⁽¹⁾

28. Software Product Identification Exit⁽¹⁾⁽⁶⁾

- Notes:
1. Data Format: I/O15 - I/O8 (Don't Care); I/O7 - I/O0 (Hex) Address Format: A11 - A0 (Hex), and A11 - A21 (Don't Care).
 2. A1 - A21 = V_{IL}. Manufacturer Code is read for A0 = V_{IL}; Device Code is read for A0 = V_{IH}.
 3. The device does not remain in identification mode if powered down.
 4. The device returns to standard operation mode.
 5. Manufacturer Code: 001FH(x16)
Device Code: 01D6H – AT49BV642D;
01D2H – AT49BV642DT.
 6. Either one of the Product ID Exit commands can be used.

29. Common Flash Interface Definition Table

Address	Data	Comments

29. Common Flash Interface Definition Table (Continued)

Address	Data	Comments
VENDOR SPECIFIC EXTENDED QUERY		
41h	0050h	"P"
42h	0052h	"R"
43h	0049h	"I"
44h	0031h	Major version number, ASCII
45h	0030h	Minor version number, ASCII
46h	0087h	Bit 0 – chip erase supported, 0 – no, 1 – yes Bit 1 – erase suspend supported, 0 – no, 1 – yes Bit 2 – program suspend supported, 0 – no, 1 – yes Bit 3 – simultaneous operations supported, 0 – no, 1 – yes Bit 4 – burst mode read supported, 0 – no, 1 – yes Bit 5 – page mode read supported, 0 – no, 1 – yes Bit 6 – queued erase supported, 0 – no, 1 – yes Bit 7 – protection bits supported, 0 – no, 1 – yes
47h	0000h AT49BV642DT or 0001h AT49BV642D	Bit 0 – top ("0") or bottom ("1") boot block device Undefined bits are "0"
48h	0000h	Bit 0 – 4 word linear burst with wrap around, 0 – no, 1 – yes Bit 1 – 8 word linear burst with wrap around, 0 – no, 1 – yes Bit 2 – continuous burst, 0 – no, 1 – yes Undefined bits are "0"
49h	0000h	Bit 0 – 4 word page, 0 – no, 1 – yes Bit 1 – 8 word page, 0 – no, 1 – yes Undefined bits are "0"
4Ah	0080h	Location of protection register lock byte, the section's first byte
4Bh	0003h	# of bytes in the factory prog section of prot register – 2*n
4Ch	0003h	# of bytes in the user prog section of prot register – 2*n

30. Ordering Information

30.1 Green Package (Pb/Halide-free/RoHS Compliant)

t _{ACC} (ns)	I _{CC} (mA)		Ordering Code	Package	Operation Range
	Active	Standby			
70	15	0.025	AT49BV642D-70TU	48T	Industrial (-40° to 85° C)
			AT49BV642DT-70TU		

Package Type	
48T	48-lead, Plastic Thin Small Outline Package (TSOP)

31. Packaging Information

31.1 48T – TSOP

- Notes:
1. This package conforms to JEDEC reference MO-142, Variation DD.
 2. Dimensions D1 and E do not include mold protrusion. Allowable protrusion on E is 0.15 mm per side and on D1 is 0.25 mm per side.
 3. Lead coplanarity is 0.10 mm maximum.

COMMON DIMENSIONS
(Unit of Measure = mm)

SYMBOL	MIN	NOM	MAX	NOTE
