PRELIMINARY

CY14B101L

1-Mbit (128K x 8) nvSRAM

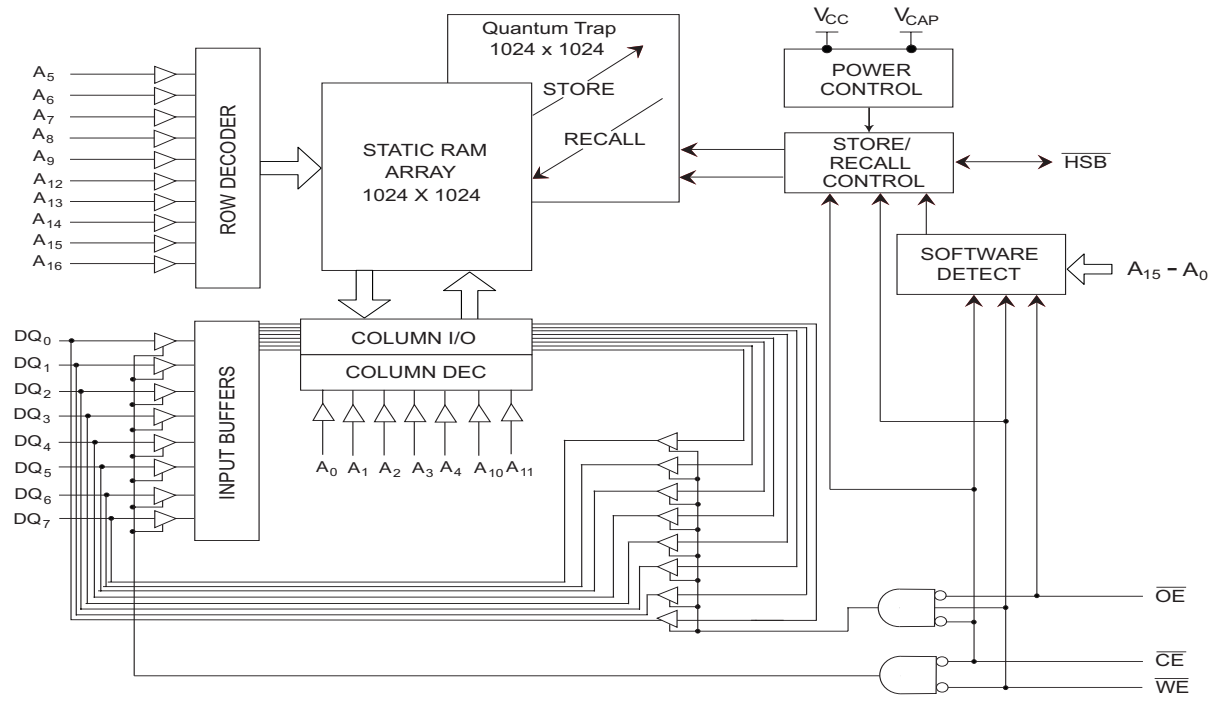
Features

- **25 ns, 35 ns, and 45 ns Access Times**
- **“Hands-off” Automatic *STORE* on Power-down with only a small capacitor**
- ***STORE* to QuantumTrap™ Nonvolatile Elements is initiated by Software, device pin or Autostore™ on Power-down**
- ***RECALL* to SRAM Initiated by Software or Power-up**
- **Infinite *READ, WRITE* and *RECALL* Cycles**
- **10 mA Typical I_{CC} at 200-ns Cycle Time**
- **200,000 *STORE* Cycles to QuantumTrap**
- **20-Year Data Retention @ 55°C**
- **Single 3V Operation +20%, -10%**
- **Commercial and Industrial Temperature**
- **SOIC and SSOP Packages**
- **RoHS Compliance**

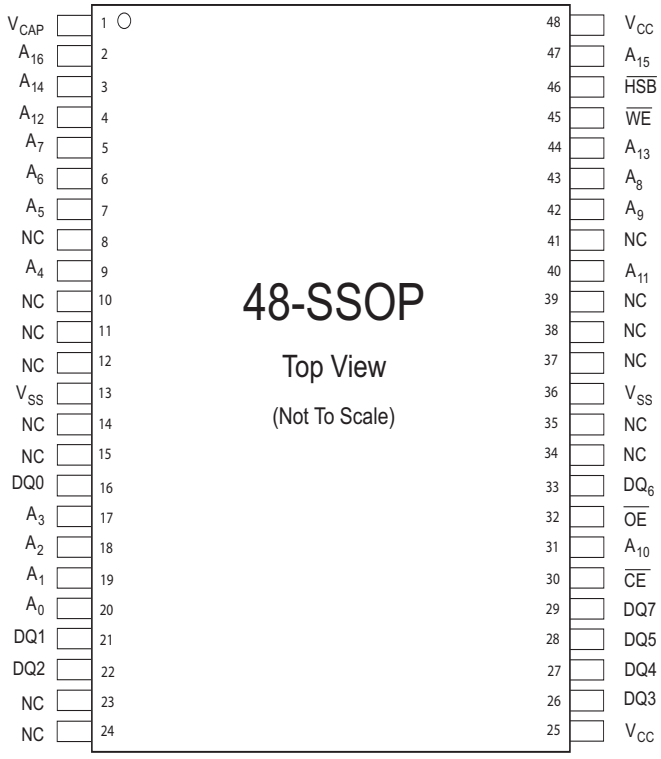
Functional Description

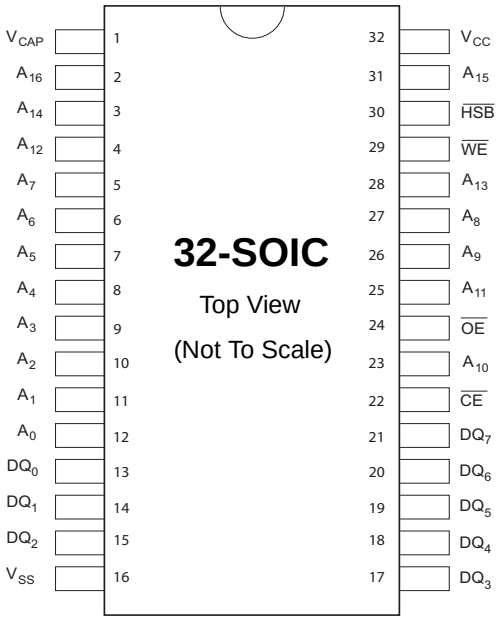
The Cypress CY14B101L is a fast static RAM with a nonvolatile element in each memory cell. The embedded nonvolatile elements incorporate QuantumTrap technology producing the world’s most reliable nonvolatile memory. The SRAM provides infinite read and write cycles, while independent, nonvolatile data resides in the highly reliable QuantumTrap cell. Data transfers from the SRAM to the nonvolatile elements (the STORE operation) takes place automatically at power-down. On power-up, data is restored to the SRAM (the RECALL operation) from the nonvolatile memory. Both the STORE and RECALL operations are also available under software control.

Logic Block Diagram



Pin Configurations





Pin Definitions

Pin Name	I/O Type	Description
A_0–A_{16}	Input	**Address Inputs used to select one of the 131,072 bytes of the nvSRAM**.
DQ0-DQ7	Input/Output	**Bidirectional Data I/O lines**. Used as input or output lines depending on operation.
$\overline{WE}$	Input	**Write Enable Input, active LOW**. When selected LOW, enables data on the I/O pins to be written to the address location latched by the falling edge of $\overline{CE}$.
$\overline{CE}$	Input	**Chip Enable Input, active LOW**. When LOW, selects the chip. When HIGH, deselects the chip.
$\overline{OE}$	Input	**Output Enable, active LOW**. The active LOW $\overline{OE}$ input enables the data output buffers during read cycles. Deasserting $\overline{OE}$ high causes the I/O pins to tri-state.
V_{SS}	Ground	**Ground for the device.** Should be connected to ground of the system.
V_{CC}	Power Supply	**Power Supply inputs to the device**.
$\overline{HSB}$	Input/Output	**Hardware Store Busy**. When low this output indicates a Hardware Store is in progress. When pulled low external to the chip it will initiate a nonvolatile STORE operation. A weak internal pull up resistor keeps this pin HIGH if not connected. (Connection Optional)
V_{CAP}	Power Supply	**Autostore Capacitor**. Supplies power to nvSRAM during power loss to store data from SRAM to nonvolatile elements.
NC	No Connect	**No Connect**. This pin is not connected to the die.

Device Operation

The CY14B101L nvSRAM is made up of two functional components paired in the same physical cell. These are a SRAM memory cell and a nonvolatile QuantumTrap cell. The SRAM memory cell operates as a standard fast static RAM. Data in the SRAM can be transferred to the nonvolatile cell (the STORE operation), or from the nonvolatile cell to SRAM (the RECALL operation). This unique architecture allows all cells to be stored and recalled in parallel. During the STORE and RECALL operations SRAM READ and WRITE operations are inhibited. The CY14B101L supports infinite reads and writes just like a typical SRAM. In addition, it provides infinite RECALL operations from the nonvolatile cells and up to 200,000 STORE operations.

SRAM Read

The CY14B101L performs a READ cycle whenever $\overline{CE}$ and $\overline{OE}$ are low while $\overline{WE}$ and $\overline{HSB}$ are high. The address specified on pins $A_{0\text{-}16}$ determines which of the 131,072 data bytes will be accessed. When the READ is initiated by an address transition, the outputs will be valid after a delay of t_{AA} (READ cycle #1). If the READ is initiated by $\overline{CE}$ or $\overline{OE}$, the outputs will be valid at t_{ACE} or at t_{DOE}, whichever is later (READ cycle #2). The data outputs will repeatedly respond to address changes within the t_{AA} access time without the need for transitions on any control input pins, and will remain valid until another address change or until $\overline{CE}$ or $\overline{OE}$ is brought high, or $\overline{WE}$ or $\overline{HSB}$ is brought low.

SRAM Write

A WRITE cycle is performed whenever $\overline{CE}$ and $\overline{WE}$ are low and $\overline{HSB}$ is high. The address inputs must be stable prior to entering the WRITE cycle and must remain stable until either $\overline{CE}$ or $\overline{WE}$ goes high at the end of the cycle.

The data on the common I/O pins I/O_{0-7} will be written into the memory if it is valid t_{SD} before the end of a $\overline{WE}$ controlled WRITE or before the end of an $\overline{CE}$ controlled WRITE. It is recommended that $\overline{OE}$ be kept high during the entire WRITE cycle to avoid data bus contention on common I/O lines. If $\overline{OE}$ is left low, internal circuitry will turn off the output buffers t_{HZWE} after $\overline{WE}$ goes low.

AutoStore™ Operation

The CY14B101L stores data to nvSRAM using one of three storage operations. These three operations are Hardware Store, activated by $\overline{HSB}$, Software Store, activated by an address sequence, and AutoStore, on device power-down. AutoStore operation is a unique feature of QuantumTrap technology and is enabled by default on the CY14B101L.

During normal operation, the device will draw current from V_{CC} to charge a capacitor connected to the V_{CAP} pin. This stored charge will be used by the chip to perform a single STORE operation. If the voltage on the V_{CC} pin drops below V_{SWITCH}, the part will automatically disconnect the V_{CAP} pin from V_{CC}. A STORE operation will be initiated with power provided by the V_{CAP} capacitor.

Figure 1 shows the proper connection of the storage capacitor (V_{CAP}) for automatic store operation. Refer to the DC Characteristics table for the size of V_{CAP}. The voltage on the V_{CAP} pin is driven to 5V by a charge pump internal to the chip. A pull-up should be placed on $\overline{WE}$ to hold it inactive during power-up.

To reduce unnecessary nonvolatile stores, AutoStore and Hardware Store operations will be ignored unless at least one WRITE operation has taken place since the most recent STORE or RECALL cycle. Software initiated STORE cycles are performed regardless of whether a WRITE operation has taken place. The $\overline{HSB}$ signal can be monitored by the system to detect an AutoStore cycle is in progress.

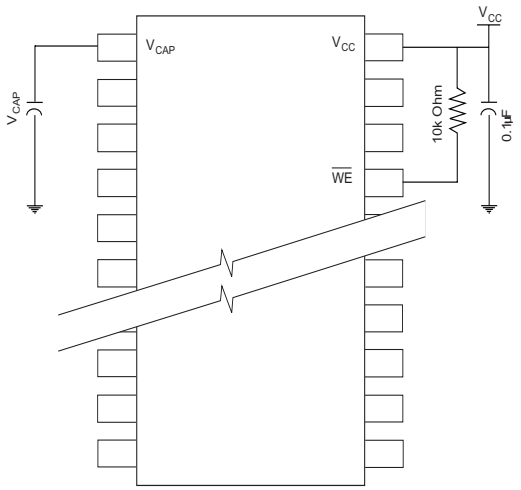


Figure 1. AutoStore™ Mode

Hardware STORE (HSB) Operation

The CY14B101L provides the $\overline{HSB}$ pin for controlling and acknowledging the STORE operations. The $\overline{HSB}$ pin can be used to request a hardware STORE cycle. When the $\overline{HSB}$ pin is driven low, the CY14B101L will conditionally initiate a STORE operation after t_{DELAY}. An actual STORE cycle will only begin if a WRITE to the SRAM took place since the last STORE or RECALL cycle. The $\overline{HSB}$ pin also acts as an open drain driver that is internally driven low to indicate a busy condition while the STORE (initiated by any means) is in progress.

SRAM READ and WRITE operations that are in progress when $\overline{HSB}$ is driven low by any means are given time to complete before the STORE operation is initiated. After $\overline{HSB}$ goes low, the CY14B101L will continue SRAM operations for t_{DELAY}. During t_{DELAY}, multiple SRAM READ operations may take place. If a WRITE is in progress when $\overline{HSB}$ is pulled low it will be allowed a time, t_{DELAY}, to complete. However, any SRAM WRITE cycles requested after $\overline{HSB}$ goes low will be inhibited until $\overline{HSB}$ returns high.

During any STORE operation, regardless of how it was initiated, the CY14B101L will continue to drive the $\overline{HSB}$ pin low, releasing it only when the STORE is complete. Upon completion of the STORE operation the CY14B101L will remain disabled until the $\overline{HSB}$ pin returns high.

If $\overline{HSB}$ is not used, it should be left unconnected.

Hardware RECALL (Power-up)

During power-up, or after any low-power condition (V_{CC} < V_{SWITCH}), an internal RECALL request will be latched. When V_{CC} once again exceeds the sense voltage of V_{SWITCH}, a

RECALL cycle will automatically be initiated and will take $t_{HRECALL}$ to complete.

Software STORE

Data can be transferred from the SRAM to the nonvolatile memory by a software address sequence. The CY14B101L software STORE cycle is initiated by executing sequential $\overline{CE}$-controlled READ cycles from six specific address locations in exact order. During the STORE cycle an erase of the previous nonvolatile data is first performed, followed by a program of the nonvolatile elements. Once a STORE cycle is initiated, further input and output are disabled until the cycle is completed.

Because a sequence of READs from specific addresses is used for STORE initiation, it is important that no other READ or WRITE accesses intervene in the sequence, or the sequence will be aborted and no STORE or RECALL will take place.

To initiate the software STORE cycle, the following READ sequence must be performed:

1. Read address 0x4E38 Valid READ
2. Read address 0xB1C7 Valid READ
3. Read address 0x83E0 Valid READ
4. Read address 0x7C1F Valid READ
5. Read address 0x703F Valid READ
6. Read address 0x8FC0 Initiate STORE cycle

The software sequence may be clocked with $\overline{CE}$ controlled READs or $\overline{OE}$ controlled READs. Once the sixth address in the sequence has been entered, the STORE cycle will commence and the chip will be disabled. It is important that READ cycles and not WRITE cycles be used in the sequence, although it is not necessary that $\overline{OE}$ be low for the sequence to be valid. After the t_{STORE} cycle time has been fulfilled, the SRAM will again be activated for READ and WRITE operation.

Software RECALL

Data can be transferred from the nonvolatile memory to the SRAM by a software address sequence. A software RECALL cycle is initiated with a sequence of READ operations in a manner similar to the software STORE initiation. To initiate the RECALL cycle, the following sequence of $\overline{CE}$ controlled READ operations must be performed:

1. Read address 0x4E38 Valid READ
2. Read address 0xB1C7 Valid READ
3. Read address 0x83E0 Valid READ
4. Read address 0x7C1F Valid READ
5. Read address 0x703F Valid READ
6. Read address 0x4C63 Initiate RECALL cycle

Internally, RECALL is a two-step procedure. First, the SRAM data is cleared, and second, the nonvolatile information is transferred into the SRAM cells. After the t_{RECALL} cycle time the SRAM will once again be ready for READ and WRITE operations. The RECALL operation in no way alters the data in the nonvolatile elements.

Table 1. Mode Selection

$\overline{CE}$	$\overline{WE}$	$\overline{OE}$	A15 - A0	Mode	I/O	Power

Preventing AutoStore

The AutoStore function can be disabled by initiating an AutoStore Disable sequence. A sequence of read operations is performed in a manner similar to the software STORE initiation. To initiate the AutoStore Disable sequence, the following sequence of $\overline{CE}$-controlled read operations must be performed:

1. Read address 0x4E38 Valid READ
2. Read address 0xB1C7 Valid READ
3. Read address 0x83E0 Valid READ
4. Read address 0x7C1F Valid READ
5. Read address 0x703F Valid READ
6. Read address 0x8B45 AutoStore Disable

The AutoStore can be re-enabled by initiating an AutoStore Enable sequence. A sequence of read operations is performed in a manner similar to the software RECALL initiation. To initiate the AutoStore Enable sequence, the following sequence of $\overline{CE}$-controlled read operations must be performed:

1. Read address 0x4E38 Valid READ
2. Read address 0xB1C7 Valid READ
3. Read address 0x83E0 Valid READ
4. Read address 0x7C1F Valid READ
5. Read address 0x703F Valid READ
6. Read address 0x4B46 AutoStore Enable

If the AutoStore function is disabled or re-enabled, a manual STORE operation (Hardware or Software) needs to be issued to save the AutoStore state through subsequent power down cycles. The part comes from the factory with AutoStore enabled.

Notes:
1. The six consecutive address locations must be in the order listed. $\overline{WE}$ must be HIGH during all six cycles to enable a non-volatile cycle.
2. While there are 17 address lines on the CY14B101L, only the lower 16 lines are used to control software modes.
3. I/O state depends on the state of $\overline{OE}$. The I/O table shown assumes $\overline{OE}$ Low.

Data Protection

The CY14B101L protects data from corruption during low-voltage conditions by inhibiting all externally initiated STORE and WRITE operations. The low voltage condition is detected when $V_{CC} \leq V_{SWITCH}$. If the CY14B101L is in a WRITE mode (both $\overline{CE}$ and $\overline{WE}$ low) at power-up, after a RECALL, or after a STORE, the WRITE will be inhibited until a negative transition on $\overline{CE}$ or $\overline{WE}$ is detected.

This protects against inadvertent writes during power-up or brown-out conditions.

Noise Considerations

The CY14B101L is a high-speed memory and so must have a high-frequency bypass capacitor of approximately 0.1 µF connected between V_{CC} and V_{SS}, using leads and traces that are as short as possible. As with all high-speed CMOS ICs, careful routing of power, ground and signals will reduce circuit noise.

Low Average Active Power

CMOS technology provides the CY14B101L the benefit of drawing significantly less current when it is cycled at times longer than 50 ns. *Figure 2* shows the relationship between I_{CC} and READ/WRITE cycle time. Worst-case current consumption is shown for commercial temperature range, V_{CC} = 3.6V, and chip enable at maximum frequency. Only standby current is drawn when the chip is disabled. The overall average current drawn by the CY14B101L depends on the following items:

1. The duty cycle of chip enable.
2. The overall cycle rate for accesses.
3. The ratio of READs to WRITEs.
4. The operating temperature.
5. The V_{CC} level.
6. I/O loading.

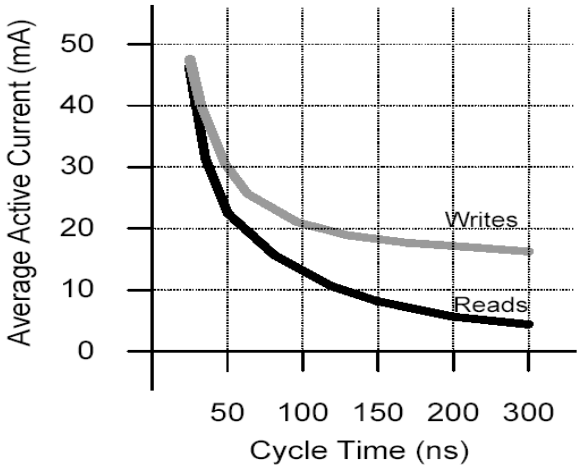

Figure 2. Current vs. Cycle Time

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature ..... –65°C to +150°C

Ambient Temperature with Power Applied ..... –55°C to +125°C

Supply Voltage on V_{CC} Relative to GND..... –0.5V to 4.1V

Voltage Applied to Outputs in High-Z State ..... –0.5V to V_{CC} + 0.5V

Input Voltage ..... –0.5V to V_{CC} + 0.5V

Transient Voltage (<20 ns) on Any Pin to Ground Potential..... –2.0V to V_{CC} + 2.0V

Package Power Dissipation Capability (T_A = 25°C) 1.0W

Surface Mount Lead Soldering Temperature (3 Seconds) ..... +260°C

Output Short Circuit Current [4] ..... 15 mA

Static Discharge Voltage..... > 2001V (per MIL-STD-883, Method 3015)

Latch-up Current..... > 200 mA

Operating Range

Range	Ambient Temperature	V_{CC}
Commercial	0°C to +70°C	2.7V to 3.6V
Industrial	–40°C to +85°C	2.7V to 3.6V

DC Electrical Characteristics Over the Operating Range (VCC = 2.7V to 3.6V) [5]

Parameter	Description	Test Conditions		Min.	Max.	Unit
I_{CC1}	Average V_{CC} Current	t_{RC} = 25 ns t_{RC} = 35 ns t_{RC} = 45 ns Dependent on output loading and cycle rate. Values obtained without output loads. I_{OUT} = 0mA.	Commercial		65 55 50	mA mA mA

Switching Waveforms

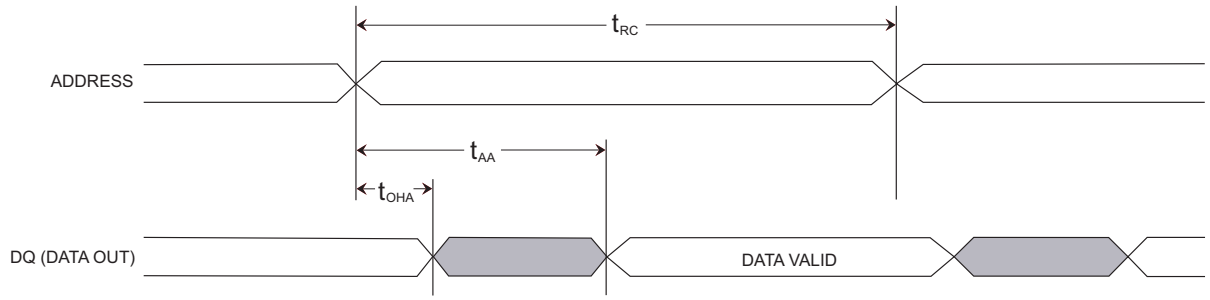

Figure 3. SRAM Read Cycle #1: Address Controlled [8,9,21]

Notes:
12. $t_{HRECALL}$ starts from the time V_{CC} rises above V_{SWITCH}.
13. If an SRAM Write has not taken place since the last nonvolatile cycle, no STORE will take place.
14. Industrial Grade Devices require 15ms Max
15. The software sequence is clocked with $\overline{CE}$ controlled or $\overline{OE}$ controlled READs.
16. The six consecutive addresses must be read in the order listed in the Mode Selection table. $\overline{WE}$ must be HIGH during all six consecutive cycles.
17. A 600 Ohm resistor must be connected to $\overline{HSB}$ for using the Software Command
18. This is the amount of time it takes to take action on a soft sequence command. Vcc power must remain HIGH to effectively register command.
19. Commands like STORE and RECALL lock out I/O until operation is complete which further increases this time. See specific command.
20. Read and Write cycles in progress before $\overline{HSB}$ are given this amount of time to complete.
21. HSB must remain HIGH during READ and WRITE cycles.

*A	437321	See ECN	TUP	Show Data Sheet on external Web
*B	471966	See ECN	TUP	Changed I_{CC3} from 5mA to 10mA Changed ISB from 2mA to 3mA Changed $V_{IH(MIN)}$ from 2.2V to 2.0V Changed t_{RECALL} from 40µs to 50µs Changed Endurance from 1Million Cycles to 500K Cycles Changed Data Retention from 100 Years to 20 Years Added Soft Sequence Processing Time Waveform Updated Part Numbering Nomenclature and Ordering Information
*C	503272	See ECN	PCI	Changed from Advance to Preliminary Changed the term “Unlimited” to “Infinite” Changed Endurance from 500K Cycles to 200K Cycles Added temperature spec. to Data Retention - 20 years at 55°C Removed Icc1 values from the DC table for 25 ns and 35 ns Industrial Grade Changed Icc2 value from 3mA to 6mA in the DC table Added a footnote on V_{IH} Changed $V_{SWITCH(MIN)}$ from 2.55V to 2.45V Added footnote #17 related to using the software command Updated Part Nomenclature Table and Ordering InformationTable
*D	597002	See ECN	TUP	Removed $V_{SWITCH(min)}$ spec from the AutoStore/Power-Up RECALL table Changed t_{GLAX} spec from 20ns to 1ns Added $t_{DELAY(max)}$ spec of 70µs in the Hardware STORE Cycle table Removed t_{HLBL} specification Changed t_{SS} specification form 70µs(min) to 70µs(max) Changed $V_{CAP(max)}$ from 57µF to 120µF
