1 Overview

This chapter gives an overview of the 512-Mbit Double-Data-Rate-Two SDRAM product family for graphics application and describes its main characteristics.

1.1 Features

The 512-Mbit Double-Data-Rate-Two SDRAM offers the following key features:

- $1.8\text{ V} \pm 0.1\text{ V } V_{DD}$ for [-20/-25]
- $1.8\text{ V} \pm 0.1\text{ V } V_{DDQ}$ for [-20/-25]
- DRAM organizations with 16 data in/outputs
- Double Data Rate architecture:
 - two data transfers per clock cycle
 - four internal banks for concurrent operation
- Programmable $\overline{\text{CAS}}$ Latency: 3, 4, 5, 6, 7
- Programmable Burst Length: 4 and 8
- Differential clock inputs (CK and $\overline{\text{CK}}$)
- Bi-directional, differential data strobes ($\overline{\text{DQS}}$ and $\overline{\text{DQS}}$) are transmitted / received with data. Edge aligned with read data and center-aligned with write data.
- DLL aligns DQ and $\overline{\text{DQS}}$ transitions with clock
- $\overline{\text{DQS}}$ can be disabled for single-ended data strobe operation
- Commands entered on each positive clock edge, data and data mask are referenced to both edges of $\overline{\text{DQS}}$
- Data masks (DM) for write data
- Posted $\overline{\text{CAS}}$ by programmable additive latency for better command and data bus efficiency
- Off-Chip-Driver impedance adjustment (OCD) and On-Die-Termination (ODT) for better signal quality.
- Auto-Precharge operation for read and write bursts
- Auto-Refresh, Self-Refresh and power saving Power-Down modes
- Average Refresh Period $7.8\ \mu\text{s}$ at a T_{CASE} lower than $85\ ^\circ\text{C}$, $3.9\ \mu\text{s}$ between $85\ ^\circ\text{C}$ and $95\ ^\circ\text{C}$
- Full Strength and reduced Strength (60%) Data-Output Drivers
- 2kB page size
- Packages: P-TFBGA-84
- RoHS Compliant Products¹⁾

TABLE 1**Ordering Information for RoHS compliant products**

Product Number	Org.	Clock (MHz)	Package
HYB18T512161B2F-20/25	×16	500/400	P-TFBGA-84

1) RoHS Compliant Product: Restriction of the use of certain hazardous substances (RoHS) in electrical and electronic equipment as defined in the directive 2002/95/EC issued by the European Parliament and of the Council of 27 January 2003. These substances include mercury, lead, cadmium, hexavalent chromium, polybrominated biphenyls and polybrominated biphenyl ethers.

HYB18T512161B2F-20/25
512-Mbit Double-Data-Rate-Two SDRAM

1.2 Description

The 512-Mb DDR2 DRAM is a high-speed Double-Data-Rate-Two CMOS DRAM device containing 536,870,912 bits and internally configured as a quad-bank DRAM. The 512-Mb device is organized as 8 Mbit \times 16 I/O \times 4 banks chip. These devices achieve high speed transfer rates starting at 800 Mb/sec/pin for general applications.

The device is designed to comply with all DDR2 DRAM key features:

1. posted $\overline{\text{CAS}}$ with additive latency,
2. write latency = read latency - 1,
3. normal and weak strength data-output driver,
4. Off-Chip Driver (OCD) impedance adjustment
5. On-Die Termination (ODT) function.

All of the control and address inputs are synchronized with a pair of externally supplied differential clocks. Inputs are latched at the cross point of differential clocks (CK rising and $\overline{\text{CK}}$ falling). All I/Os are synchronized with a single ended DQS or differential DQS- $\overline{\text{DQS}}$ pair in a source synchronous fashion.

A 15-bit address bus is used to convey row, column and bank address information in a $\overline{\text{RAS}}$ -CAS multiplexing style.

An Auto-Refresh and Self-Refresh mode is provided along with various power-saving power-down modes.

The functionality described and the timing specifications included in this data sheet are for the DLL Enabled mode of operation.

The DDR2 SDRAM is available in P-TFBGA package.

2 Configuration

2.1 Chip Configuration

The chip configuration of a DDR2 SDRAM is listed by function in **Table 2**. The abbreviations used in the Ball# and Buffer Type columns are explained in **Table 3** and **Table 4** respectively. The ball numbering for the FBGA package is depicted in **Figure 1**.

TABLE 2
Chip Configuration of DDR2 SDRAM

Ball#	Name	Ball Type	Buffer Type	Function
Clock Signals				
J8	CK	I	SSTL	Clock Signal CK, Complementary Clock Signal \overline{CK} <i>Note: CK and \overline{CK} are differential system clock inputs. All address and control inputs are sampled on the crossing of the positive edge of CK and negative edge of \overline{CK}. Output (read) data is referenced to the crossing of CK and \overline{CK} (both direction of crossing)</i>
K8	\overline{CK}	I	SSTL	
K2	CKE	I	SSTL	Clock Enable <i>Note: CKE HIGH activates and CKE LOW deactivates internal clock signals and device input buffers and output drivers. Taking CKE LOW provides Precharge Power-Down and Self-Refresh operation (all banks idle), or Active Power-Down (row Active in any bank). CKE is synchronous for power down entry and exit and for self-refresh entry. Input buffers excluding CKE are disabled during self-refresh. CKE is used asynchronously to detect self-refresh exit condition. Self-refresh termination itself is synchronous. After V_{REF} has become stable during power-on and initialisation sequence, it must be maintained for proper operation of the CKE receiver. For proper self-refresh entry and exit, V_{REF} must be maintained to this input. CKE must be maintained HIGH throughout read and write accesses. Input buffers, excluding CK, \overline{CK}, ODT and CKE are disabled during power-down</i>
Control Signals

TABLE 4
Abbreviations for Buffer Type

Abbreviation	Description
SSTL	Serial Stub Terminated Logic (SSTL_18)
LV-CMOS	Low Voltage CMOS
CMOS	CMOS Levels
OD	Open Drain. The corresponding ball has 2 operational states, active low and tristate, and allows multiple devices to share as a wire-OR.

FIGURE 1
Chip Configuration, PG-TFBGA-84 (top view)

Notes

1. $\overline{UDQS}/UDQS$ is data strobe for DQ[15:8], $\overline{LDQS}/LDQS$ is data strobe for DQ[7:0]
2. LDM is the data mask signal for DQ[7:0], UDM is the data mask signal for DQ[15:8]
3. V_{DDL} and V_{SSDL} are power and ground for the DLL. V_{DDL} is connected to V_{DD} on the device. V_{DD} , V_{DDQ} , V_{SSDL} , V_{SS} , and V_{SSQ} are isolated on the device.

- 1) w = write only register bits
- 2) Number of clock cycles for write recovery during auto-precharge. WR in clock cycles is calculated by dividing t_{WR} (in ns) by t_{CK} (in ns) and rounding up to the next integer: $WR [cycles] \geq t_{WR} (ns) / t_{CK} (ns)$. The mode register must be programmed to fulfill the minimum requirement for the analogue t_{WR} timing WR_{MIN} is determined by $t_{CK,MAX}$ and WR_{MAX} is determined by $t_{CK,MIN}$.

- 1) w = write only
- 2) When DRAM is operated at $85^{\circ}\text{C} \leq T_{\text{Case}} \leq 95^{\circ}\text{C}$ the extended self refresh rate must be enabled by setting bit A7 to "1" before the self refresh mode can be entered.
- 3) If PASR (Partial Array Self Refresh) is enabled, data located in areas of the array beyond the specified location will be lost if self refresh is entered. Data integrity will be maintained if t_{REF} conditions are met and no Self Refresh command is issued

Burst Length	Starting Address (A2 A1 A0)	Sequential Addressing (decimal)	Interleave Addressing (decimal)
4	x 0 0	0, 1, 2, 3	0, 1, 2, 3
	x 0 1	1, 2, 3, 0	1, 0, 3, 2
	x 1 0	2, 3, 0, 1	2, 3, 0, 1
	x 1 1	3, 0, 1, 2	3, 2, 1, 0
8	0 0 0	0, 1, 2, 3, 4, 5, 6, 7	0, 1, 2, 3, 4, 5, 6, 7
	0 0 1	1, 2, 3, 0, 5, 6, 7, 4	1, 0, 3, 2, 5, 4, 7, 6
	0 1 0	2, 3, 0, 1, 6, 7, 4, 5	2, 3, 0, 1, 6, 7, 4, 5
	0 1 1	3, 0, 1, 2, 7, 4, 5, 6	3, 2, 1, 0, 7, 6, 5, 4
	1 0 0	4, 5, 6, 7, 0, 1, 2, 3	4, 5, 6, 7, 0, 1, 2, 3
	1 0 1	5, 6, 7, 4, 1, 2, 3, 0	5, 4, 7, 6, 1, 0, 3, 2
	1 1 0	6, 7, 4, 5, 2, 3, 0, 1	6, 7, 4, 5, 2, 3, 0, 1
	1 1 1	7, 4, 5, 6, 3, 0, 1, 2	7, 6, 5, 4, 3, 2, 1, 0

Notes

1. PageSize and Length is a function of I/O organization:32Mb (CA[9:0]); Page Size = 2 kByte; Page Length = 1024

2. Order of burst access for sequential addressing is "nibble-based" and therefore different from SDR or DDR components

4 Truth Tables

			L	H	H	H					
Power Down Exit	L	H	H	X	X	X	X	X	X	X	4)9)
			L	H	H	H					

- 1) The state of ODT does not affect the states described in this table. The ODT function is not available during Self Refresh.
- 2) "X" means "H or L (but a defined logic level)".
- 3) Operation that is not specified is illegal and after such an event, in order to guarantee proper operation, the DRAM must be powered down and then restarted through the specified initialization sequence before normal operation can continue.
- 4) All DDR2 SDRAM commands are defined by states of \overline{CS} , \overline{WE} , \overline{RAS} , \overline{CAS} , and CKE at the rising edge of the clock.
- 5) Bank addresses BA[1:0] determine which bank is to be operated upon. For (E)MRS BA[1:0] selects an (Extended) Mode Register.
- 6) V_{REF} must be maintained during Self Refresh operation.
- 7) Self Refresh Exit is asynchronous.
- 8) Burst reads or writes at BL = 4 cannot be terminated.
- 9) The Power Down Mode does not perform any refresh operations. The duration of Power Down is therefore limited by the refresh requirements

TABLE 13
Clock Enable (CKE) Truth Table for Synchronous Transitions

Current State ¹⁾	CKE		Command (N) ²⁾³⁾ RAS, CAS, WE, CS	Action (N) ²⁾	Note ⁴⁾⁵⁾
	Previous Cycle ⁶⁾ (N-1)	Current Cycle ⁶⁾ (N)			
Power-Down	L	L	X	Maintain Power-Down	7)8)11)
	L	H	DESELECT or NOP	Power-Down Exit	7)9)10)11)
Self Refresh	L	L	X	Maintain Self Refresh	8)11)12)
	L	H	DESELECT or NOP	Self Refresh Exit	9)12)13)14)
Bank(s)Active	H	L	DESELECT or NOP	Active Power-Down Entry	7)9)10)11)15)
All Banks Idle	H	L	DESELECT or NOP	Precharge Power-Down Entry	9)10)11)15)
	H	L	AUTOREFRESH	Self Refresh Entry	7)11)14)16)
Any State other than listed above	H	H	Refer to the Command Truth Table		17)

- 1) Current state is the state of the DDR2 SDRAM immediately prior to clock edge N.
- 2) Command (N) is the command registered at clock edge N, and Action (N) is a result of Command (N)
- 3) The state of ODT does not affect the states described in this table. The ODT function is not available during Self Refresh.
- 4) CKE must be maintained HIGH while the device is in OCD calibration mode.
- 5) Operation that is not specified is illegal and after such an event, in order to guarantee proper operation, the DRAM must be powered down and then restarted through the specified initialization sequence before normal operation can continue.
- 6) CKE (N) is the logic state of CKE at clock edge N; CKE (N-1) was the state of CKE at the previous clock edge.
- 7) The Power-Down Mode does not perform any refresh operations. The duration of Power-Down Mode is therefor limited by the refresh requirements
- 8) "X" means "don't care (including floating around V_{REF})" in Self Refresh and Power Down. However ODT must be driven HIGH or LOW in Power Down if the ODT function is enabled (Bit A2 or A6 set to "1" in EMRS(1)).
- 9) All states and sequences not shown are illegal or reserved unless explicitly described elsewhere in this document.
- 10) Valid commands for Power-Down Entry and Exit are NOP and DESELECT only.
- 11) $t_{CKE,MIN}$ of 3 clocks means CKE must be registered on three consecutive positive clock edges. CKE must remain at the valid input level the entire time it takes to achieve the 3 clocks of registration. Thus, after any CKE transition, CKE may not transition from its valid level during the time period of $t_{IS} + 2 \times t_{CKE} + t_{IH}$.
- 12) V_{REF} must be maintained during Self Refresh operation.
- 13) On Self Refresh Exit DESELECT or NOP commands must be issued on every clock edge occurring during the tXSNR period. Read commands may be issued only after t_{XSRD} (200 clocks) is satisfied.
- 14) Valid commands for Self Refresh Exit are NOP and DESELECT only.
- 15) Power-Down and Self Refresh can not be entered while Read or Write operations, (Extended) mode Register operations, Precharge or Refresh operations are in progress.
- 16) Self Refresh mode can only be entered from the All Banks Idle state.
- 17) Must be a legal command as defined in the Command Truth Table.

TABLE 14
Data Mask (DM) Truth Table

Name (Function)	DM	DQs	Note
Write Enable	L	Valid	1)
Write Inhibit	H	X	1)

- 1) Used to mask write data; provided coincident with the corresponding data.

5 Electrical Characteristics

TABLE 15
DRAM Component Operating Temperature Range

Symbol	Parameter	Rating	Unit	Notes
T_{CASE}	Operating Temperature	0 to 95	°C	1)2)3)4)

- 1) Operating Temperature is the case surface temperature on the center / top side of the DRAM.
- 2) The operating temperature range are the temperatures where all DRAM specification will be supported. During operation, the DRAM case temperature must be maintained between 0 - 95 °C under all other specification parameters.
- 3) Above 85 °C case temperature the Auto-Refresh command interval has to be reduced to $t_{REFI} = 3.9 \mu s$.
- 4) When operating this product in the 85°C to 95°C T_{CASE} temperature range, the High Temperature Self Refresh has to be enabled by setting EMR(2) bit A7 to "1". Note, when the High Temperature Self Refresh is enabled there is an increase of I_{DD6} by approximately 50%

5.1 Absolute Maximum Ratings

TABLE 16
Absolute Maximum Ratings

Symbol	Parameter	Rating		Unit	Notes
		min	max		
V_{DD}	Voltage on V_{DD} pin relative to V_{SS}	-1.0	2.3	V	1)
V_{DDQ}	Voltage on V_{DDQ} pin relative to V_{SS}	-0.5	2.3	V	1)
V_{DDL}	Voltage on VDDL pin relative to V_{SS}	-0.5	2.3	V	1)
V_{IN}, V_{OUT}	Voltage on any pin relative to V_{SS}	-0.5	2.3	V	1)
T_J	Junction Temperature		125	°C	1)
T_{STG}	Storage Temperature	-55	150	°C	1)2)

- 1) Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- 2) Storage Temperature is the case surface temperature on the center/top side of the DRAM.

5.2 DC Characteristics

TABLE 17
Recommended DC Operating Conditions (SSTL_18)

Symbol	Parameter	Rating			Unit	Notes
		Min.	Typ.	Max.		
V_{DD}	Supply Voltage	1.7	1.8	1.9	V	1)2)
V_{DDDL}	Supply Voltage for DLL	1.7	1.8	1.9	V	1)2)
V_{DDQ}	Supply Voltage for Output	1.7	1.8	1.9	V	1)2)
V_{REF}	Input Reference Voltage	$0.49 \times V_{DDQ}$	$0.5 \times V_{DDQ}$	$0.51 \times V_{DDQ}$	V	3)4)
V_{TT}	Termination Voltage	$V_{REF} - 0.04$	V_{REF}	$V_{REF} + 0.04$	V	5)

- 1) HYB18T512161B2F-20/25
- 2) V_{DDQ} tracks with V_{DD} ; V_{DDDL} tracks with V_{DD} . AC parameters are measured with V_{DD} , V_{DDQ} and V_{DDDL} tied together.
- 3) The value of V_{REF} may be selected by the user to provide optimum noise margin in the system. Typically the value of V_{REF} is expected to be about $0.5 \times V_{DDQ}$ of the transmitting device and V_{REF} is expected to track variations in V_{DDQ} .
- 4) Peak to peak ac noise on V_{REF} may not exceed $\pm 2\% V_{REF}$ (dc)
- 5) V_{TT} is not applied directly to the device. V_{TT} is a system supply for signal termination resistors, is expected to be set equal to V_{REF} , and must track variations in die dc level of V_{REF} .

TABLE 18
ODT DC Electrical Characteristics

Parameter / Condition	Symbol	Min.	Nom.	Max.	Unit	Note
Termination resistor impedance value for EMRS(1)[A6,A2] = [0,1]; 75 Ohm	Rtt1(eff)	60	75	90	Ω	1)
Termination resistor impedance value for EMRS(1)[A6,A2] = [1,0]; 150 Ohm	Rtt2(eff)	120	150	180	Ω	1)
Termination resistor impedance value for EMRS(1)(A6,A2)=[1,1]; 50 Ohm	Rtt3(eff)	40	50	60	Ω	1)
Deviation of V_M with respect to $V_{DDQ} / 2$	delta V_M	-6.00	—	+ 6.00	%	2)

- 1) Measurement Definition for Rtt(eff): Apply $V_{IH(ac)}$ and $V_{IL(ac)}$ to test pin separately, then measure current $I(V_{IH(ac)})$ and $I(V_{IL(ac)})$ respectively.
 $Rtt(eff) = (V_{IH(ac)} - V_{IL(ac)}) / (I(V_{IH(ac)}) - I(V_{IL(ac)}))$.
- 2) Measurement Definition for V_M : Turn ODT on and measure voltage (V_M) at test pin (midpoint) with no load: $delta V_M = ((2 \times V_M / V_{DDQ}) - 1) \times 100\%$

TABLE 19
Input and Output Leakage Currents

Symbol	Parameter / Condition	Min.	Max.	Unit	Notes
IIL	Input Leakage Current; any input $0 V < V_{IN} < V_{DD}$	-2	+2	μA	1)
IOL	Output Leakage Current; $0 V < V_{OUT} < V_{DDQ}$	-5	+5	μA	2)

- 1) all other pins not under test = 0 V
- 2) DQ's, LDQS, LDQS, UDQS, UDQS, DQS, DQS are disabled and ODT is turned off

5.3 DC & AC Characteristics

DDR2 SDRAM pin timing are specified for either single ended or differential mode depending on the setting of the EMRS(1) "Enable \overline{DQS} " mode bit; timing advantages of differential mode are realized in system design. The method by which the DDR2 SDRAM pin timing are measured is mode dependent. In single ended mode, timing relationships are measured relative to the rising or falling edges of DQS crossing at V_{REF} .

In differential mode, these timing relationships are measured relative to the crosspoint of DQS and its complement, \overline{DQS} . This distinction in timing methods is verified by design and characterization but not subject to production test. In single ended mode, the \overline{DQS} signals are internally disabled and don't care.

TABLE 20
DC & AC Logic Input Levels

Symbol	Parameter	Min.	Max.	Units
$V_{IH(dc)}$	DC input logic high	$V_{REF} + 0.125$	$V_{DDQ} + 0.3$	V
$V_{IL(dc)}$	DC input low	-0.3	$V_{REF} - 0.125$	V
$V_{IH(ac)}$	AC input logic high	$V_{REF} + 0.250$	—	V
$V_{IL(ac)}$	AC input low	—	$V_{REF} - 0.250$	V

TABLE 21
Single-ended AC Input Test Conditions

Symbol	Condition	Value	Unit	Notes
V_{REF}	Input reference voltage	$0.5 \times V_{DDQ}$	V	1)
$V_{SWING.MAX}$	Input signal maximum peak to peak swing	1.0	V	1)
SLEW	Input signal minimum Slew Rate	1.0	V / ns	2)3)

- 1) Input waveform timing is referenced to the input signal crossing through the V_{REF} level applied to the device under test.
- 2) The input signal minimum Slew Rate is to be maintained over the range from $V_{IH(ac).MIN}$ to V_{REF} for rising edges and the range from V_{REF} to $V_{IL(ac).MAX}$ for falling edges as shown in **Figure 2**
- 3) AC timings are referenced with input waveforms switching from $V_{IL(ac)}$ to $V_{IH(ac)}$ on the positive transitions and $V_{IH(ac)}$ to $V_{IL(ac)}$ on the negative transitions.

FIGURE 2

Single-ended AC Input Test Conditions Diagram

TABLE 22

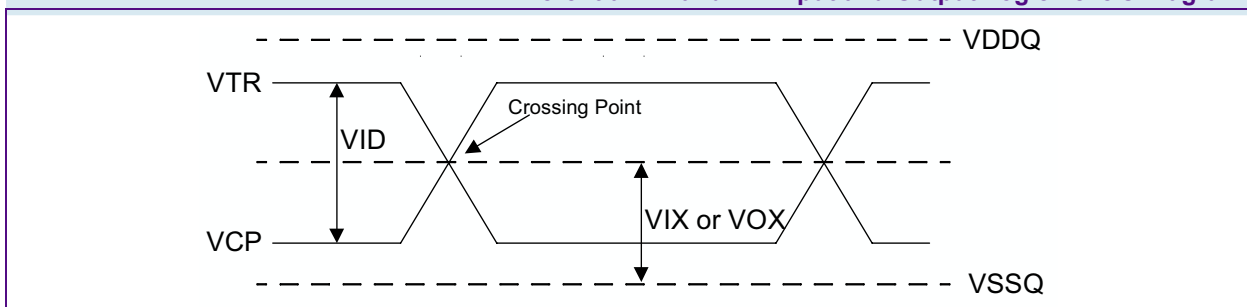

Differential DC and AC Input and Output Logic Levels

Symbol	Parameter	Min.	Max.	Unit	Notes
$V_{IN(dc)}$	DC input signal voltage	-0.3	$V_{DDQ} + 0.3$	—	1)
$V_{ID(dc)}$	DC differential input voltage	0.25	$V_{DDQ} + 0.6$	—	2)
$V_{ID(ac)}$	AC differential input voltage	0.5	$V_{DDQ} + 0.6$	V	3)
$V_{IX(ac)}$	AC differential cross point input voltage	$0.5 \times V_{DDQ} - 0.175$	$0.5 \times V_{DDQ} + 0.175$	V	4)
$V_{OX(ac)}$	AC differential cross point output voltage	$0.5 \times V_{DDQ} - 0.125$	$0.5 \times V_{DDQ} + 0.125$	V	5)

- 1) $V_{IN(dc)}$ specifies the allowable DC execution of each input of differential pair such as CK, CK, DQS, DQS etc.
- 2) $V_{ID(dc)}$ specifies the input differential voltage $V_{TR} - V_{CP}$ required for switching. The minimum value is equal to $V_{IH(dc)} - V_{IL(dc)}$.
- 3) $V_{ID(ac)}$ specifies the input differential voltage $V_{TR} - V_{CP}$ required for switching. The minimum value is equal to $V_{IH(ac)} - V_{IL(ac)}$.
- 4) The value of $V_{IX(ac)}$ is expected to equal $0.5 \times V_{DDQ}$ of the transmitting device and $V_{IX(ac)}$ is expected to track variations in V_{DDQ} . $V_{IX(ac)}$ indicates the voltage at which differential input signals must cross.
- 5) The value of $V_{OX(ac)}$ is expected to equal $0.5 \times V_{DDQ}$ of the transmitting device and $V_{OX(ac)}$ is expected to track variations in V_{DDQ} . $V_{OX(ac)}$ indicates the voltage at which differential input signals must cross.

RAS-CAS-Delay		t_{RCD}	15	—	15	—	ns	1)2)3)4)
Row Precharge Time		t_{RP}	15	—	15	—	ns	1)2)3)4)

- 1) Timings are guaranteed with CK/CK differential Slew Rate of 2.0 V/ns. For DQS signals timings are guaranteed with a differential Slew Rate of 2.0 V/ns in differential strobe mode and a Slew Rate of 1 V/ns in single ended mode. For other Slew Rates see Chapter 8 Timings are further guaranteed for normal OCD drive strength (EMRS(1) A1 = 0) under the "Reference Load for Timing Measurements" according to **Chapter 7.1** only.
- 2) The CK/CK input reference level (for timing reference to CK/CK) is the point at which CK and CK cross. The DQS / DQS, input reference level is the crosspoint when in differential strobe mode; The input reference level for signals other than CK/CK, DQS / DQS is defined in **Chapter 7.3**.
- 3) Inputs are not recognized as valid until V_{REF} stabilizes. During the period before V_{REF} stabilizes, $CKE = 0.2 \times V_{DDQ}$ is recognized as low.
- 4) The output timing reference voltage level is V_{TT} . See **Chapter 7.1** for the reference load for timing measurements.
- 5) $t_{RAS,MAX}$ is calculated from the maximum amount of time a DDR2 device can operate without a refresh command which is equal to $9 \times t_{REFI}$.

5.7.2 AC Timing Parameters

List of Timing Parameters

TABLE 29
Timing Parameter by Speed Grade

Parameter	Symbol	-20		-25		Unit	Notes ¹⁾ 2)3)4)5)6)
		Min.	Max.	Min.	Max.		
DQ output access time from CK / $\overline{\text{CK}}$	t_{AC}	-450	+450	-500	+500	ps

Exit Self-Refresh to Read command	t_{XSRD}	200	—	200	—	t_{CK}	

- 1) V_{DDQ} , V_{DD} refer to **Chapter 1**.
- 2) Timing that is not specified is illegal and after such an event, in order to guarantee proper operation, the DRAM must be powered down and then restarted through the specified initialization sequence before normal operation can continue.
- 3) Timings are guaranteed with CK/\overline{CK} differential Slew Rate of 2.0 V/ns. For DQS signals timings are guaranteed with a differential Slew Rate of 2.0 V/ns in differential strobe mode and a Slew Rate of 1 V/ns in single ended mode. For other Slew Rates see **Chapter 5** of this data sheet.
- 4) The CK / \overline{CK} input reference level (for timing reference to CK / \overline{CK}) is the point at which CK and \overline{CK} cross. The DQS / \overline{DQS} , input reference level is the crosspoint when in differential strobe mode; The input reference level for signals other than CK/\overline{CK} , DQS / \overline{DQS} is defined in **Chapter 5.3** of this data sheet.
- 5) Inputs are not recognized as valid until V_{REF} stabilizes. During the period before V_{REF} stabilizes, $CKE = 0.2 \times V_{DDQ}$ is recognized as low.
- 6) The output timing reference voltage level is V_{TT} . See **Chapter 5** for the reference load for timing measurements.
- 7) For each of the terms, if not already an integer, round to the next highest integer. t_{CK} refers to the application clock period. WR refers to the WR parameter stored in the MR.
- 8) The clock frequency is allowed to change during self-refresh mode or precharge power-down mode. In case of clock frequency change during power-down, a specific procedure is required.
- 9) timing is referenced to Industrial standard definition
- 10) Consists of data pin skew and output pattern effects, and p-channel to n-channel variation of the output drivers as well as output Slew Rate mis-match between DQS / \overline{DQS} and associated DQ in any given cycle.
- 11) MIN (t_{CL} , t_{CH}) refers to the smaller of the actual clock low time and the actual clock high time as provided to the device (i.e. this value can be greater than the minimum specification limits for t_{CL} and t_{CH}).

HYB18T512161B2F-20/25
512-Mbit Double-Data-Rate-Two SDRAM

- 12) The t_{HZ} , t_{RPST} and t_{LZ} , t_{RPRE} parameters are referenced to a specific voltage level, which specify when the device output is no longer driving (t_{HZ} , t_{RPST}), or begins driving (t_{LZ} , t_{RPRE}). t_{HZ} and t_{LZ} transitions occur in the same access time windows as valid data transitions. These parameters are verified by design and characterization, but not subject to production test.
- 13) The Auto-Refresh command interval has been reduced to 3.9 μ s when operating the DDR2 DRAM in a temperature range between 85 °C and 95 °C.
- 14) $0\text{ }^{\circ}\text{C} \leq T_{CASE} \leq 85\text{ }^{\circ}\text{C}$
- 15) $85\text{ }^{\circ}\text{C} < T_{CASE} \leq 95\text{ }^{\circ}\text{C}$
- 16) A maximum of eight Auto-Refresh commands can be posted to any given DDR2 SDRAM device.
- 17) The maximum limit for the t_{WPST} parameter is not a device limit. The device operates with a greater value for this parameter, but system performance (bus turnaround) degrades accordingly.
- 18) WR must be programmed to fulfill the minimum requirement for the t_{WR} timing parameter, where $WR_{MIN}[\text{cycles}] = t_{WR}(\text{ns})/t_{CK}(\text{ns})$ rounded up to the next integer value. $t_{DAL} = WR + (t_{RP}/t_{CK})$. For each of the terms, if not already an integer, round to the next highest integer. t_{CK} refers to the application clock period. WR refers to the WR parameter stored in the MRS.
- 19) Minimum t_{WTR} is two clocks when operating the DDR2-SDRAM at frequencies ≤ 200 MHz.
- 20) User can choose two different active power-down modes for additional power saving via MRS address bit A12. In "standard active power-down mode" (MR, A12 = "0") a fast power-down exit timing t_{XARD} can be used. In "low active power-down mode" (MR, A12 = "1") a slow power-down exit timing t_{XARDS} has to be satisfied.

5.7.3 ODT AC Electrical Characteristics

TABLE 30
ODT AC Electrical Characteristics and Operating Conditions for all bins

Symbol	Parameter / Condition	Values		Unit	Note
		Min.	Max.		
t_{AOND}	ODT turn-on delay	2	2	t_{CK}	
t_{AON}	ODT turn-on	$t_{AC,MIN}$	$t_{AC,MAX} + 0.7\text{ ns}$	ns	1)
t_{AONPD}	ODT turn-on (Power-Down Modes)	$t_{AC,MIN} + 2\text{ ns}$	$2 t_{CK} + t_{AC,MAX} + 1\text{ ns}$	ns	
t_{AOFD}	ODT turn-off delay	2.5	2.5	t_{CK}	
t_{AOF}	ODT turn-off	$t_{AC,MIN}$	$t_{AC,MAX} + 0.6\text{ ns}$	ns	2)
t_{AOFPD}	ODT turn-off (Power-Down Modes)	$t_{AC,MIN} + 2\text{ ns}$	$2.5 t_{CK} + t_{AC,MAX} + 1\text{ ns}$	ns	
t_{ANPD}	ODT to Power Down Mode Entry Latency	3	—	t_{CK}	
t_{AXPD}	ODT Power Down Exit Latency	8	—	t_{CK}	

- 1) ODT turn on time min. is when the device leaves high impedance and ODT resistance begins to turn on. ODT turn on time max is when the ODT resistance is fully on. Both are measure from t_{AOND} .
- 2) ODT turn off time min. is when the device starts to turn off ODT resistance. ODT turn off time max is when the bus is in high impedance. Both are measured from t_{AOFD} .

6 Specifications and Conditions

TABLE 31
I_{DD} Measurement Conditions

Parameter	Symbol	Note
Operating Current - One bank Active - Precharge $t_{CK} = t_{CK(1DD)}$, $t_{RC} = t_{RC(1DD)}$, $t_{RAS} = t_{RAS.MIN(1DD)}$; CKE is HIGH, \overline{CS} is HIGH between valid commands. Address and control inputs are switching; Databus inputs are switching.	I_{DD0}	1)2)3)4)5)6)
Operating Current - One bank Active - Read - Precharge $I_{OUT} = 0$ mA, BL = 4, $t_{CK} = t_{CK(1DD)}$, $t_{RC} = t_{RC(1DD)}$, $t_{RAS} = t_{RAS.MIN(1DD)}$, $t_{RCD} = t_{RCD(1DD)}$, AL = 0, CL = CL(1DD); CKE is HIGH, CS is HIGH between valid commands. Address and control inputs are switching; Databus inputs are switching.	I_{DD1}	1)2)3)4)5)6)
Precharge Power-Down Current All banks idle; CKE is LOW; $t_{CK} = t_{CK(1DD)}$; Other control and address inputs are stable; Data bus inputs are floating.	I_{DD2P}	1)2)3)4)5)6)
Precharge Standby Current All banks idle; \overline{CS} is HIGH; CKE is HIGH; $t_{CK} = t_{CK(1DD)}$; Other control and address inputs are switching, Data bus inputs are switching.	I_{DD2N}	1)2)3)4)5)6)
Precharge Quiet Standby Current All banks idle; \overline{CS} is HIGH; CKE is HIGH; $t_{CK} = t_{CK(1DD)}$; Other control and address inputs are stable, Data bus inputs are floating.	I_{DD2Q}	1)2)3)4)5)6)
Active Power-Down Current All banks open; $t_{CK} = t_{CK(1DD)}$, CKE is LOW; Other control and address inputs are stable; Data bus inputs are floating. MRS A12 bit is set to "0" (Fast Power-down Exit).	$I_{DD3P(0)}$	1)2)3)4)5)6)
Active Power-Down Current All banks open; $t_{CK} = t_{CK(1DD)}$, CKE is LOW; Other control and address inputs are stable, Data bus inputs are floating. MRS A12 bit is set to 1 (Slow Power-down Exit);	$I_{DD3P(1)}$	1)2)3)4)5)6)
Active Standby Current All banks open; $t_{CK} = t_{CK(1DD)}$; $t_{RAS} = t_{RAS.MAX(1DD)}$, $t_{RP} = t_{RP(1DD)}$; CKE is HIGH, \overline{CS} is HIGH between valid commands. Address inputs are switching; Data Bus inputs are switching;	I_{DD3N}	1)2)3)4)5)6)
Operating Current Burst Read: All banks open; Continuous burst reads; BL = 4; AL = 0, CL = CL(1DD); $t_{CK} = t_{CK(1DD)}$; $t_{RAS} = t_{RAS.MAX(1DD)}$, $t_{RP} = t_{RP(1DD)}$; CKE is HIGH, \overline{CS} is HIGH between valid commands. Address inputs are switching; Data Bus inputs are switching; $I_{OUT} = 0$ mA.	I_{DD4R}	1)2)3)4)5)6)
Operating Current Burst Write: All banks open; Continuous burst writes; BL = 4; AL = 0, CL = CL(1DD); $t_{CK} = t_{CK(1DD)}$; $t_{RAS} = t_{RAS.MAX(1DD)}$, $t_{RP} = t_{RP(1DD)}$; CKE is HIGH, CS is HIGH between valid commands. Address inputs are switching; Data Bus inputs are switching;	I_{DD4W}	1)2)3)4)5)6)
Burst Refresh Current $t_{CK} = t_{CK(1DD)}$; Refresh command every $t_{RFC} = t_{RFC(1DD)}$ interval, CKE is HIGH, \overline{CS} is HIGH between valid commands, Other control and address inputs are switching, Data bus inputs are switching.	I_{DD5B}	1)2)3)4)5)6)
Distributed Refresh Current $t_{CK} = t_{CK(1DD)}$; Refresh command every $t_{REFI} = 7.8$ μ s interval, CKE is LOW and \overline{CS} is HIGH between valid commands, Other control and address inputs are switching, Data bus inputs are switching.	I_{DD5D}	1)2)3)4)5)6)

HYB18T512161B2F-20/25
512-Mbit Double-Data-Rate-Two SDRAM

Parameter	Symbol	Note
Self-Refresh Current CKE \leq 0.2 V; external clock off, CK and $\overline{\text{CK}}$ at 0 V; Other control and address inputs are floating, Data bus inputs are floating.	I_{DD6}	1)2)3)4)5)6)
Operating Bank Interleave Read Current 1. All banks interleaving reads, $I_{\text{OUT}} = 0$ mA; BL = 4, $\overline{\text{CL}} = \text{CL}_{(\text{IDD})}$, $\overline{\text{AL}} = t_{\text{RCD}(\text{IDD})} - 1 \times t_{\text{CK}(\text{IDD})}$; $t_{\text{CK}} = t_{\text{CK}(\text{IDD})}$, $t_{\text{RC}} = t_{\text{RC}(\text{IDD})}$, $t_{\text{RRD}} = t_{\text{RRD}(\text{IDD})}$; CKE is HIGH, CS is HIGH between valid commands. Address bus inputs are stable during deselects; Data bus is switching.	I_{DD7}	1)2)3)4)5)6)7)

- 1) $V_{\text{DDQ}} = 1.8 \text{ V} \pm 0.1 \text{ V}$; $V_{\text{DD}} = 1.8 \text{ V} \pm 0.1 \text{ V}$
- 2) I_{DD} specifications are tested after the device is properly initialized.
- 3) I_{DD} parameter are specified with ODT disabled.
- 4) Data Bus consists of DQ, DM, DQS, $\overline{\text{DQS}}$, LDQS, $\overline{\text{LDQS}}$, UDQS and $\overline{\text{UDQS}}$.
- 5) Definitions for I_{DD} : see **Table 32**
- 6) Timing parameter minimum and maximum values for I_{DD} current measurements are defined in chapter 7..
- 7) A = Activate, RA = Read with Auto-Precharge, D=DESELECT

TABLE 32
Definition for I_{DD}

Parameter	Description
LOW	defined as $V_{\text{IN}} \leq V_{\text{IL}(\text{ac})\text{MAX}}$
HIGH	defined as $V_{\text{IN}} \geq V_{\text{IH}(\text{ac})\text{MIN}}$
STABLE	defined as inputs are stable at a HIGH or LOW level
FLOATING	defined as inputs are $V_{\text{REF}} = V_{\text{DDQ}} / 2$
SWITCHING	defined as: Inputs are changing between high and low every other clock (once per two clocks) for address and control signals, and inputs changing between high and low every other clock (once per clock) for DQ signals not including mask or strobes

With respect to any examples or hints given herein, any typical values stated herein and/or any information regarding the application of the device, Qimonda hereby disclaims any and all warranties and liabilities of any kind, including without limitation warranties of non-infringement of intellectual property rights of any third party.

Information

For further information on technology, delivery terms and conditions and prices please contact your nearest Qimonda Office.

Warnings

Due to technical requirements components may contain dangerous substances. For information on the types in question please contact your nearest Qimonda Office.

Under no circumstances may the Qimonda product as referred to in this Internet Data Sheet be used in

1. Any applications that are intended for military usage (including but not limited to weaponry), or
2. Any applications, devices or systems which are safety critical or serve the purpose of supporting, maintaining, sustaining or protecting human life (such applications, devices and systems collectively referred to as "Critical Systems"), if
 - a) A failure of the Qimonda product can reasonable be expected to - directly or indirectly -
 - (i) Have a detrimental effect on such Critical Systems in terms of reliability, effectiveness or safety; or
 - (ii) Cause the failure of such Critical Systems; or
 - b) A failure or malfunction of such Critical Systems can reasonably be expected to - directly or indirectly -
 - (i) Endanger the health or the life of the user of such Critical Systems or any other person; or
 - (ii) Otherwise cause material damages (including but not limited to death, bodily injury or significant damages to property, whether tangible or intangible).
