

# M58BW016DB M58BW016DT M58BW016FT M58BW016FB

16 Mbit (512 Kb x 32, boot block, burst)  
3 V supply Flash memories

## Features

- Supply voltage
  - $V_{DD} = 2.7\text{ V to }3.6\text{ V}$  for Program, Erase and Read
  - $V_{DDQ} = V_{DDQIN} = 2.4\text{ V to }3.6\text{ V}$  for I/O buffers
  - $V_{PP} = 12\text{ V}$  for Fast Program (optional)
- High performance
  - Access times: 70, 80 ns
  - 56 MHz effective zero wait-state Burst Read
  - Synchronous Burst Read
  - Asynchronous Page Read
- Hardware block protection
  - $\overline{WP}$  pin for Write Protect of the 4 outermost parameter blocks and all main blocks
  - $\overline{RP}$  pin for Write Protect of all blocks
- Optimized for FDI drivers
  - Fast Program / Erase Suspend latency time  $< 6\ \mu\text{s}$
  - Common Flash interface
- Memory blocks
  - 8 parameters blocks (top or bottom)
  - 31 main blocks
- Low power consumption
  - 5  $\mu\text{A}$  typical Deep Power-down
  - 60  $\mu\text{A}$  typical standby for M58BW016DT/B
  - 150  $\mu\text{A}$  typical standby for M58BW016FT/B
  - Automatic standby after Asynchronous Read
- Electronic signature
  - Manufacturer code: 20h
  - Top device code: 8836h
  - Bottom device code: 8835h
- ECOPACK<sup>®</sup> packages available

PQFP80 (T)

LBGA80 10 x 12 mm

# 1 Description

The M58BW016DT, M58BW016DB, M58BW016FT and M58BW016FB are 16 Mbit non-volatile Flash memories that can be erased electrically at the block level and programmed in-system on a double-word basis using a 2.7 V to 3.6 V  $V_{DD}$  supply for the circuit and a  $V_{DDQ}$  supply down to 2.4 V for the input and output buffers. Optionally a 12 V  $V_{PP}$  supply can be used to provide fast program and erase for a limited time and number of program/erase cycles.

The devices support Asynchronous (Latch Controlled and Page Read) and Synchronous Bus operations. The Synchronous Burst Read interface allows a high data transfer rate controlled by the Burst Clock, K, signal. It is capable of bursting fixed or unlimited lengths of data. The burst type, latency and length can be configured and can be easily adapted to a large variety of system clock frequencies and microprocessors. All writes are asynchronous. On power-up the memory defaults to Read mode with an Asynchronous Bus.

The devices have a boot block architecture with an array of 8 parameter blocks of 64 Kb each and 31 main blocks of 512 Kb each. In the M58BW016DT and M58BW016FT the parameter blocks are located at the top of the address space whereas in the M58BW016DB and M58BW016FB, they are located at the bottom.

Program and Erase commands are written to the command interface of the memory. An on-chip Program/Erase controller simplifies the process of programming or erasing the memory by taking care of all of the special operations that are required to update the memory contents. The end of a program or erase operation can be detected and any error conditions identified in the Status Register. The command set required to control the memory is consistent with JEDEC standards.

Erase can be suspended in order to perform either Read or Program in any other block and then resumed. Program can be suspended to Read data in any other block and then resumed. Each block can be programmed and erased over 100,000 cycles.

All blocks are protected during power-up.

The M58BW016DT, M58BW016DB, M58BW016FT and M58BW016FB feature two different levels of block protection to avoid unwanted program/erase operations:

- The  $\overline{WP}$  pin offers an hardware protection on two of the parameter blocks and all of the main blocks
- All program or erase operations are blocked when Reset,  $\overline{RP}$ , is held Low. A Reset/Power-down mode is entered when the  $\overline{RP}$  input is Low. In this mode the power consumption is lower than in the normal standby mode, the device is write protected and both the Status and the Burst Configuration Registers are cleared. A recovery time is required when the  $\overline{RP}$  input goes High.

The memory is offered in a PQFP80 (14 x 20 mm) and LPGA80 (10 x 12 mm) package.

The memories are supplied with all the bits erased (set to '1').

In the present document, M58BW016DT, M58BW016DB, M58BW016FT and M58BW016FB will be referred to as M58BW016 unless otherwise specified.

Figure 1. Logic diagram

Table 1. Signal names

| Signal             | Description  | Direction |
|--------------------|--|-----------|
| A0-A18             | Address inputs   | Inputs    |
| DQ0-DQ7            | Data input/output, command input                                   | I/O       |
| DQ8-DQ15           | Data input/output, Burst Configuration Register                    | I/O       |
| DQ16-DQ31          | Data input/output  | I/O       |
| $\bar{B}$          | Burst Address Advance  | Input     |
| $\bar{E}$          | Chip Enable  | Input     |
| $\bar{G}$          | Output Enable  | Input     |
| K                  | Burst Clock  | Input     |
| $\bar{L}$          | Latch Enable   | Input     |

## 1.1 Block protection

The M58BW016 feature two different levels of block protection.

- **Write Protect pin,  $\overline{WP}$** , - When  $\overline{WP}$  is Low, V<sub>IL</sub>, all the lockable parameter blocks (two upper (top) or lower (bottom)) and all the main blocks are protected. When  $\overline{WP}$  is High (V<sub>IH</sub>) all the lockable parameter blocks and all the main blocks are unprotected
- **Reset/Power-down pin,  $\overline{RP}$** , - If the device is held in Reset mode ( $\overline{RP}$  at V<sub>IL</sub>), no program or erase operations can be performed on any block.

After a device reset the first two kinds of block protection ( $\overline{WP}$ ,  $\overline{RP}$ ) can be combined to give a flexible block protection.

**Table 2. M58BW016DT and M58BW016FT top boot block addresses**

## 2 Signal descriptions

See [Figure 1: Logic diagram](#), and [Table 1: Signal names](#) for a brief overview of the signals connected to this device.

### 2.1 Address inputs (A0-A18)

The address inputs are used to select the cells to access in the memory array during Bus operations either to read or to program data. During Bus Write operations they control the commands sent to the command interface of the Program/Erase controller. Chip Enable must be Low when selecting the addresses.

The address inputs are latched on the rising edge of Latch Enable  $\bar{L}$  or Burst Clock K, whichever occurs first, in a read operation. The address inputs are latched on the rising edge of Chip Enable, Write Enable or Latch Enable, whichever occurs first in a write operation. The address latch is transparent when Latch Enable is Low,  $V_{IL}$ . The address is internally latched in an erase or program operation.

### 2.2 Data inputs/outputs (DQ0-DQ31)

The Data inputs/outputs output the data stored at the selected address during a Bus Read operation, or are used to input the data during a program operation. During Bus Write operations they represent the commands sent to the command interface of the Program/Erase controller. When used to input data or write commands they are latched on the rising edge of Write Enable or Chip Enable, whichever occurs first.

When Chip Enable and Output Enable are both Low,  $V_{IL}$ , and Output Disable is at  $V_{IH}$ , the data bus outputs data from the memory array, the electronic signature, the CFI information or the contents of the Status Register. The data bus is high impedance when the device is deselected with Chip Enable at  $V_{IH}$ , Output Enable at  $V_{IH}$ , Output Disable at  $V_{IL}$  or Reset/Power-down at  $V_{IL}$ . The Status Register content is output on DQ0-DQ7 and DQ8-DQ31 are at  $V_{IL}$ .

### 2.3 Chip Enable ( $\bar{E}$ )

The Chip Enable,  $\bar{E}$ , input activates the memory control logic, input buffers, decoders and sense amplifiers. Chip Enable,  $\bar{E}$ , at  $V_{IH}$  deselected the memory and reduces the power consumption to the standby level.

### 2.4 Output Enable ( $\bar{G}$ )

The Output Enable,  $\bar{G}$ , gates the outputs through the data output buffers during a read operation, when Output Disable  $\bar{GD}$  is at  $V_{IH}$ . When Output Enable  $\bar{G}$  is at  $V_{IH}$ , the outputs are high impedance independently of Output Disable.

## 2.5 Output Disable ( $\overline{\text{GD}}$ )

The Output Disable,  $\overline{\text{GD}}$ , deactivates the data output buffers. When Output Disable,  $\overline{\text{GD}}$ , is at  $V_{\text{IH}}$ , the outputs are driven by the Output Enable. When Output Disable,  $\overline{\text{GD}}$ , is at  $V_{\text{IL}}$ , the outputs are high impedance independently of Output Enable. The Output Disable pin must be connected to an external pull-up resistor as there is no internal pull-up resistor to drive the pin.

## 2.6 Write Enable ( $\overline{\text{W}}$ )

The Write Enable,  $\overline{\text{W}}$ , input controls writing to the command interface, Address inputs and Data latches. Both addresses and data can be latched on the rising edge of Write Enable (also see Latch Enable,  $\overline{\text{L}}$ ).

## 2.7 Reset/Power-down ( $\overline{\text{RP}}$ )

The Reset/Power-down,  $\overline{\text{RP}}$ , is used to apply a hardware reset to the memory. A hardware reset is achieved by holding Reset/Power-down Low,  $V_{\text{IL}}$ , for at least  $t_{\text{PLPH}}$ . Writing is inhibited to protect data, the command interface and the Program/Erase controller are reset. The Status Register information is cleared and power consumption is reduced to deep power-down level. The device acts as deselected, that is the data outputs are high impedance.

After Reset/Power-down goes High,  $V_{\text{IH}}$ , the memory will be ready for Bus Read operations after a delay of  $t_{\text{PHEL}}$  or Bus Write operations after  $t_{\text{PHWL}}$ .

If Reset/Power-down goes Low,  $V_{\text{IL}}$ , during a Block Erase, or a Program the operation is aborted, in a time of  $t_{\text{PLRH}}$  maximum, and data is altered and may be corrupted.

During Power-up power should be applied simultaneously to  $V_{\text{DD}}$  and  $V_{\text{DDQ(IN)}}$  with  $\overline{\text{RP}}$  held at  $V_{\text{IL}}$ . When the supplies are stable  $\overline{\text{RP}}$  is taken to  $V_{\text{IH}}$ . Output Enable,  $\overline{\text{G}}$ , Chip Enable,  $\overline{\text{E}}$ , and Write Enable,  $\overline{\text{W}}$ , should be held at  $V_{\text{IH}}$  during power-up.

In an application, it is recommended to associate Reset/Power-down pin,  $\overline{\text{RP}}$ , with the reset signal of the microprocessor. Otherwise, if a reset operation occurs while the memory is performing an erase or program operation, the memory may output the Status Register information instead of being initialized to the default Asynchronous Random Read.

See [Table 22: Reset, Power-down and Power-up AC characteristics](#) and [Figure 17: Reset, Power-down and Power-up AC waveforms - control pins low](#), for more details.

## 2.8 Latch Enable ( $\overline{\text{L}}$ )

The Bus interface can be configured to latch the Address Inputs on the rising edge of Latch Enable,  $\overline{\text{L}}$ , for Asynchronous Latch Enable Controlled Read or Write or Synchronous Burst Read operations. In Synchronous Burst Read operations the address is latched on the active edge of the Clock when Latch Enable is Low,  $V_{\text{IL}}$ . Once latched, the addresses may change without affecting the address used by the memory. When Latch Enable is Low,  $V_{\text{IL}}$ , the latch is transparent. Latch Enable,  $\overline{\text{L}}$ , can remain at  $V_{\text{IL}}$  for Asynchronous Random Read and Write operations.

## 2.9 Burst Clock (K)

The Burst Clock, K, is used to synchronize the memory with the external bus during Synchronous Burst Read operations. Bus signals are latched on the active edge of the Clock. The Clock can be configured to have an active rising or falling edge. In Synchronous Burst Read mode the address is latched on the first active clock edge when Latch Enable is Low,  $V_{IL}$ , or on the rising edge of Latch Enable, whichever occurs first.

During Asynchronous Bus operations the Clock is not used.

## 2.10 Burst Address Advance ( $\overline{B}$ )

The Burst Address Advance,  $\overline{B}$ , controls the advancing of the address by the internal address counter during Synchronous Burst Read operations.

Burst Address Advance,  $\overline{B}$ , is only sampled on the active clock edge of the Clock when the X-latency time has expired. If Burst Address Advance is Low,  $V_{IL}$ , the internal address counter advances. If Burst Address Advance is High,  $V_{IH}$ , the internal address counter does not change; the same data remains on the Data inputs/outputs and Burst Address Advance is not sampled until the Y-latency expires.

The Burst Address Advance,  $\overline{B}$ , may be tied to  $V_{IL}$ .

## 2.11 Valid Data Ready (R)

The Valid Data Ready output, R, is an open drain output that can be used, during Synchronous Burst Read operations, to identify if the memory is ready to output data or not. The Valid Data Ready output can be configured to be active on the clock edge of the invalid data read cycle or one cycle before. Valid Data Ready, at  $V_{IH}$ , indicates that new data is or will be available. When Valid Data Ready is Low,  $V_{IL}$ , the previous data outputs remain active.

In all asynchronous operations, Valid Data Ready is high-impedance. It may be tied to other components with the same Valid Data Ready signal to create a unique system Ready signal. The Valid Data Ready output has an internal pull-up resistor of around 1 M $\Omega$  powered from  $V_{DDQ}$ , designers should use an external pull-up resistor of the correct value to meet the external timing requirements for Valid Data Ready going to  $V_{IH}$ .

## 2.12 Write Protect ( $\overline{WP}$ )

The Write Protect,  $\overline{WP}$ , provides protection against program or erase operations. When Write Protect,  $\overline{WP}$ , is at  $V_{IL}$  the first two (in the bottom configuration) or last two (in the top configuration) parameter blocks and all main blocks are locked. When Write Protect  $\overline{WP}$  is at  $V_{IH}$  all the blocks can be programmed or erased, if no other protection is used.

## 2.13 Supply voltage ( $V_{DD}$ )

The supply voltage,  $V_{DD}$ , is the core power supply. All internal circuits draw their current from the  $V_{DD}$  pin, including the Program/Erase controller.

## 2.14 Output supply voltage ( $V_{DDQ}$ )

The output supply voltage,  $V_{DDQ}$ , is the output buffer power supply for all operations (Read, Program and Erase) used for DQ0-DQ31 when used as outputs.

## 2.15 Input supply voltage ( $V_{DDQIN}$ )

The input supply voltage,  $V_{DDQIN}$ , is the power supply for all input signal. Input signals are:  $\bar{K}$ ,  $\bar{B}$ ,  $\bar{L}$ ,  $\bar{W}$ ,  $\bar{GD}$ ,  $\bar{G}$ ,  $\bar{E}$ , A0-A18 and DQ0-DQ31, when used as inputs.

## 2.16 Program/Erase supply voltage ( $V_{PP}$ )

The Program/Erase supply voltage,  $V_{PP}$ , is used for program and erase operations. The memory normally executes program and erase operations at  $V_{PP1}$  voltage levels. In a manufacturing environment, programming may be speeded up by applying a higher voltage level,  $V_{PPH}$ , to the  $V_{PP}$  pin.

The voltage level  $V_{PPH}$  may be applied for a total of 80 hours over a maximum of 1000 cycles. Stressing the device beyond these limits could damage the device.

## 2.17 Ground ( $V_{SS}$ and $V_{SSQ}$ )

The ground  $V_{SS}$  is the reference for the internal supply voltage  $V_{DD}$ . The ground  $V_{SSQ}$  is the reference for the output and input supplies  $V_{DDQ}$ , and  $V_{DDQIN}$ . It is essential to connect  $V_{SS}$  and  $V_{SSQ}$  together.

*Note:* A 0.1  $\mu\text{F}$  capacitor should be connected between the supply voltages,  $V_{DD}$ ,  $V_{DDQ}$  and  $V_{DDQIN}$  and the grounds,  $V_{SS}$  and  $V_{SSQ}$  to decouple the current surges from the power supply. The PCB track widths must be sufficient to carry the currents required during all operations of the parts, see [Table 15: DC characteristics](#), for maximum current supply requirements.

## 2.18 Don't use (DU)

This pin should not be used as it is internally connected. Its voltage level can be between  $V_{SS}$  and  $V_{DDQ}$  or leave it unconnected.

## 2.19 Not connected (NC)

This pin is not physically connected to the device.

## 3 Bus operations

Each bus operation that controls the memory is described in this section, see [Table 4](#), [Table 5](#) and [Table 6](#) Bus operations, for a summary. The bus operation is selected through the Burst Configuration Register; the bits in this register are described at the end of this section.

On power-up or after a hardware reset the memory defaults to Asynchronous Bus Read and Asynchronous Bus Write, no other bus operation can be performed until the Burst Control Register has been configured.

The electronic signature, CFI or Status Register will be read in asynchronous mode regardless of the Burst Control Register settings.

Typically glitches of less than 5 ns on Chip Enable or Write Enable are ignored by the memory and do not affect bus operations.

### 3.1 Asynchronous Bus operations

For asynchronous bus operations refer to [Table 4](#) together with the following text.

#### 3.1.1 Asynchronous Bus Read

Asynchronous Bus Read operations read from the memory cells, or specific registers (electronic signature, Status Register, CFI and Burst Configuration Register) in the command interface. A valid bus operation involves setting the desired address on the address inputs, applying a Low signal,  $V_{IL}$ , to Chip Enable and Output Enable and keeping Write Enable and Output Disable High,  $V_{IH}$ . The Data inputs/outputs will output the value, see [Figure 8: Asynchronous Bus Read AC waveforms](#), and [Table 16: Asynchronous Bus Read AC characteristics](#), for details of when the output becomes valid.

Asynchronous Read is the default read mode which the device enters on power-up or on return from Reset/Power-down.

#### 3.1.2 Asynchronous Latch Controlled Bus Read

Asynchronous Latch Controlled Bus Read operations read from the memory cells or specific registers in the command interface. The address is latched in the memory before the value is output on the data bus, allowing the address to change during the cycle without affecting the address that the memory uses.

A valid bus operation involves setting the desired address on the address inputs, setting Chip Enable and Latch Enable Low,  $V_{IL}$  and keeping Write Enable High,  $V_{IH}$ ; the address is latched on the rising edge of Latch Enable. Once latched, the address inputs can change. Set Output Enable Low,  $V_{IL}$ , to read the data on the Data inputs/outputs; see [Figure 9: Asynchronous Latch Controlled Bus Read AC waveforms](#), and [Table 17: Asynchronous Latch Controlled Bus Read AC characteristics](#), for details on when the output becomes valid.

Note that, since the Latch Enable input is transparent when set Low,  $V_{IL}$ , Asynchronous Bus Read operations can be performed when the memory is configured for Asynchronous Latch Enable bus operations by holding Latch Enable Low,  $V_{IL}$  throughout the bus operation.

### 3.1.3 Asynchronous Page Read

Asynchronous Page Read operations are used to read from several addresses within the same memory page. Each memory page is 4 double-words and is addressed by the address inputs A0 and A1.

Data is read internally and stored in the page buffer. Valid bus operations are the same as Asynchronous Bus Read operations but with different timings. The first read operation within the page has identical timings, subsequent reads within the same page have much shorter access times. If the page changes then the normal, longer timings apply again. Page Read does not support Latched Controlled Read.

See [Figure 10: Asynchronous Page Read AC waveforms](#), and [Table 18: Asynchronous Page Read AC characteristics](#), for details on when the outputs become valid.

### 3.1.4 Asynchronous Bus Write

Asynchronous Bus Write operations write to the command interface to send commands to the memory or to latch addresses and input data to program. Bus Write operations are asynchronous, the clock, K, is Don't care during Bus Write operations.

A valid Asynchronous Bus Write operation begins by setting the desired address on the address inputs, and setting Chip Enable, Write Enable and Latch Enable Low,  $V_{IL}$ , and Output Enable High,  $V_{IH}$ , or Output Disable Low,  $V_{IL}$ . The address inputs are latched by the command interface on the rising edge of Chip Enable or Write Enable, whichever occurs first. Commands and input data are latched on the rising edge of Chip Enable,  $\bar{E}$ , or Write Enable,  $\bar{W}$ , whichever occurs first. Output Enable must remain High, and Output Disable Low, during the whole Asynchronous Bus Write operation.

See [Figure 11: Asynchronous Write AC waveforms](#), and [Table 19: Asynchronous Write and Latch controlled Write AC characteristics](#), for details of the timing requirements.

### 3.1.5 Asynchronous Latch Controlled Bus Write

Asynchronous Latch Controlled Bus Write operations write to the command interface to send commands to the memory or to latch addresses and input data to program. Bus Write operations are asynchronous, the clock, K, is Don't care during Bus Write operations.

A valid Asynchronous Latch Controlled Bus Write operation begins by setting the desired address on the address inputs and pulsing Latch Enable Low,  $V_{IL}$ . The address inputs are latched by the command interface on the rising edge of Latch Enable, Write Enable or Chip Enable, whichever occurs first. Commands and input data are latched on the rising edge of Chip Enable,  $\bar{E}$ , or Write Enable,  $\bar{W}$ , whichever occurs first. Output Enable must remain High, and Output Disable Low, during the whole Asynchronous Bus Write operation.

See [Figure 12: Asynchronous Latch controlled Write AC waveforms](#), and [Table 19: Asynchronous Write and Latch controlled Write AC characteristics](#), for details of the timing requirements.

### 3.1.6 Output Disable

The data outputs are high impedance when the Output Enable,  $\bar{G}$ , is at  $V_{IH}$  or Output Disable,  $\bar{GD}$ , is at  $V_{IL}$ .

### 3.1.7 Standby mode

When Chip Enable is High,  $V_{IH}$ , and the Program/Erase controller is idle, the memory enters Standby mode, the power consumption is reduced to the standby level and the Data inputs/outputs pins are placed in the high impedance state regardless of Output Enable, Write Enable or Output Disable inputs.

### 3.1.8 Automatic Low Power mode

If there is no change in the state of the bus for a short period of time during Asynchronous Bus Read operations the memory enters Auto Low Power mode where the internal Supply current is reduced to the Auto-Standby Supply current. The Data inputs/outputs will still output data if a Bus Read operation is in progress.

Automatic Low Power is only available in Asynchronous Read modes.

### 3.1.9 Power-down mode

The memory is in Power-down when Reset/Power-down,  $\overline{RP}$ , is at  $V_{IL}$ . The power consumption is reduced to the power-down level and the outputs are high impedance, independent of the Chip Enable,  $\overline{E}$ , Output Enable,  $\overline{G}$ , Output Disable,  $\overline{GD}$ , or Write Enable,  $\overline{W}$ , inputs.

### 3.1.10 Electronic signature

Two codes identifying the manufacturer and the device can be read from the memory allowing programming equipment or applications to automatically match their interface to the characteristics of the memory. The electronic signature is output by giving the Read Electronic Signature command. The manufacturer code is output when all the address inputs are at  $V_{IL}$ . The device code is output when A1 is at  $V_{IH}$  and all the other address pins are at  $V_{IL}$  (see [Table 5: Asynchronous Read Electronic Signature operation](#)). Issue a Read Memory Array command to return to Read mode.

**Table 4. Asynchronous Bus operations<sup>(1)</sup>**

| Bus Operation                           | Step          | $\overline{E}$ | $\overline{G}$ | $\overline{GD}$ | $\overline{W}$ | $\overline{RP}$ | $\overline{L}$ | A0-A18  | DQ0-DQ31    |
|---|---------------|----------------|----------------|-----------------|----------------|-----------------|----------------|---------|-------------|
| Asynchronous Bus Read                   |               | $V_{IL}$       | $V_{IL}$       | $V_{IH}$        | $V_{IH}$       | $V_{IH}$        | $V_{IL}$       | Address | Data output |

## 3.2 Synchronous Bus operations

For Synchronous Bus Operations refer to [Table 6](#) together with the following text.

### 3.2.1 Synchronous Burst Read

Synchronous Burst Read operations are used to read from the memory at specific times synchronized to an external reference clock.

In the M58BW016FT and M58BW016FB only, once the memory is configured in Burst mode, it is mandatory to have an active clock signal since the switching of the output buffer data bus is synchronized to the active edge of the clock. In the absence of clock, no data is output.

**Caution:** The M58BW016DT and M58BW016DB are not concerned by the paragraph above.

The burst type, length and latency can be configured. The different configurations for Synchronous Burst Read operations are described in [Section 3.3: Burst Configuration Register](#). Refer to [Figure 4](#) and [Figure 5](#) for examples of synchronous burst operations.

In Continuous Burst Read, one Burst Read operation can access the entire memory sequentially by keeping the Burst Address Advance  $\bar{B}$  at  $V_{IL}$  for the appropriate number of clock cycles. At the end of the memory address space the Burst Read restarts from the beginning at address 000000h.

A valid Synchronous Burst Read operation begins when the Burst Clock is active and Chip Enable and Latch Enable are Low,  $V_{IL}$ . The Burst Start Address is latched and loaded into the internal Burst Address Counter on the valid Burst Clock K edge (rising or falling depending on the value of M6) or on the rising edge of Latch Enable, whichever occurs first.

After an initial memory latency time, the memory outputs data each clock cycle (or two clock cycles depending on the value of M9). The Burst Address Advance  $\bar{B}$  input controls the memory burst output. The second burst output is on the next clock valid edge after the Burst Address Advance  $\bar{B}$  has been pulled Low.

Valid Data Ready, R, monitors if the memory burst boundary is exceeded and the Burst controller of the microprocessor needs to insert wait states. When Valid Data Ready is Low on the active clock edge, no new data is available and the memory does not increment the internal address counter at the active clock edge even if Burst Address Advance,  $\bar{B}$ , is Low.

Valid Data Ready may be configured (by bit M8 of Burst Configuration Register) to be valid immediately at the valid clock edge or one data cycle before the valid clock edge.

Synchronous Burst Read will be suspended if Burst Address Advance,  $\overline{B}$ , goes High,  $V_{IH}$ .

If Output Enable is at  $V_{IL}$  and Output Disable is at  $V_{IH}$ , the last data is still valid.

If Output Enable,  $\overline{G}$ , is at  $V_{IH}$  or Output Disable,  $\overline{GD}$ , is at  $V_{IL}$ , but the Burst Address Advance,  $\overline{B}$ , is at  $V_{IL}$  the internal Burst Address counter is incremented at each Burst Clock K valid edge.

The Synchronous Burst Read timing diagrams and AC characteristics are described in the AC and DC parameters section. See [Figure 13](#), [Figure 14](#), [Figure 15](#) and [Figure 16](#), and [Table 20](#).

### 3.2.2 Synchronous Burst Read Suspend

During a Synchronous Burst Read operation it is possible to suspend the operation, freeing the data bus for other higher priority devices.

A valid Synchronous Burst Read operation is suspended when both Output Enable and Burst Address Advance are High,  $V_{IH}$ . The Burst Address Advance going High,  $V_{IH}$ , stops the Burst counter and the Output Enable going High,  $V_{IH}$ , inhibits the data outputs. The Synchronous Burst Read operation can be resumed by setting Output Enable Low.

**Table 6. Synchronous Burst Read Bus operations<sup>(1)(2)</sup>**

| Bus operation             | Step                        | $\overline{E}$ | $\overline{G}$ | $\overline{GD}$ | $\overline{RP}$ | K <sup>(3)</sup> | $\overline{L}$ | $\overline{B}$ | A0-A18<br>DQ0-DQ31 |

1. X = Don't care,  $V_{IL}$  or  $V_{IH}$ .

2. M15 = 0, bit M15 is in the Burst Configuration Register.

3. T = transition, see M6 in the Burst Configuration Register for details on the active edge of K.

### 3.3 Burst Configuration Register

The Burst Configuration Register is used to configure the type of bus access that the memory will perform.

The Burst Configuration Register is set through the command interface and will retain its information until it is re-configured, the device is reset, or the device goes into Reset/Power-down mode. The Burst Configuration Register bits are described in [Table 7](#). They specify the selection of the burst length, burst type, burst X and Y latencies and the read operation. Refer to [Figure 4](#) and [Figure 5](#) for examples of synchronous burst configurations.

#### 3.3.1 Read Select bit (M15)

The Read Select bit, M15, is used to switch between Asynchronous and Synchronous Bus Read operations. When the Read Select bit is set to '1', Bus Read operations are asynchronous; when the Read Select bit is set to '0', Bus Read operations are synchronous.

On reset or power-up the Read Select bit is set to '1' for asynchronous accesses.

#### 3.3.2 X-Latency bits (M14-M11)

The X-Latency bits are used during Synchronous Bus Read operations to set the number of clock cycles between the address being latched and the first data becoming available. For correct operation the X-Latency bits can only assume the values in [Table 7: Burst Configuration Register](#). The X-Latency bits should also be selected in conjunction with [Table 8: Burst type definition](#) to ensure valid settings.

#### 3.3.3 Y-Latency bit (M9)

The Y-Latency bit is used during Synchronous Bus Read operations to set the number of clock cycles between consecutive reads. The Y-Latency value depends on both the X-Latency value and the setting in M9.

When the Y-Latency is '1' the data changes each clock cycle; when the Y-Latency is '2' the data changes every second clock cycle. See [Table 7: Burst Configuration Register](#), and [Table 8: Burst type definition](#) for valid combinations of the Y-Latency, the X-Latency and the Clock frequency.

#### 3.3.4 Valid Data Ready bit (M8)

The Valid Data Ready bit controls the timing of the Valid Data Ready output pin, R. When the Valid Data Ready bit is '0' the Valid Data Ready output pin is driven Low for the active clock edge when invalid data is output on the bus. When the Valid Data Ready bit is '1' the Valid Data Ready output pin is driven Low one clock cycle prior to invalid data being output on the bus.

#### 3.3.5 Burst Type bit (M7)

The Burst Type bit is used to configure the sequence of addresses read as sequential or interleaved. When the Burst Type bit is '0' the memory outputs from interleaved addresses; when the Burst Type bit is '1' the memory outputs from sequential addresses. See [Table 8: Burst type definition](#), for the sequence of addresses output from a given starting address in each mode.

### 3.3.6 Valid Clock Edge bit (M6)

The Valid Clock Edge bit, M6, is used to configure the active edge of the Clock, K, during Synchronous Burst Read operations. When the Valid Clock Edge bit is '0' the falling edge of the Clock is the active edge; when the Valid Clock Edge bit is '1' the rising edge of the Clock is active.

### 3.3.7 Wrap Burst bit (M3)

The burst reads can be confined inside the 4 or 8 double-word boundary (wrap) or overcome the boundary (no wrap). The Wrap Burst bit is used to select between wrap and no wrap. When the Wrap Burst bit is set to '0' the burst read wraps; when it is set to '1' the burst read does not wrap.

### 3.3.8 Burst Length bit (M2-M0)

The Burst Length bits set the maximum number of double-words that can be output during a Synchronous Burst Read operation before the address wraps. Burst lengths of 4 or 8 are available for both the sequential and interleaved burst types, and a continuous burst is available for the sequential type.

[Table 7: Burst Configuration Register](#) gives the valid combinations of the Burst Length bits that the memory accepts; [Table 8: Burst type definition](#), gives the sequence of addresses output from a given starting address for each length.

If either a Continuous or a No Wrap Burst Read has been initiated the device will output data synchronously. Depending on the starting address, the device activates the Valid Data Ready output to indicate that a delay is necessary before the data is output. If the starting address is aligned to an 8 double-word boundary, the Continuous Burst mode will run without activating the Valid Data Ready output. If the starting address is not aligned to an 8 double-word boundary, Valid Data Ready is activated to indicate that the device needs an internal delay to read the successive words in the array.

**M10, M5 and M4** are reserved for future use.

Table 7. Burst Configuration Register

| Bit     | Description              | Value | Description   |
|---------|--------------------------|-------|---|
| M15     | Read Select              | 0     | Synchronous Burst Read                                    |

1. X latencies can be calculated as:  $(t_{AVQV} - t_{LLKH} + t_{QVKH}) + t_{SYSTEM\ MARGIN} < (X - 1) t_K$ . (X is an integer number from 4 to 8,  $t_K$  is the clock period and  $t_{SYSTEM\ MARGIN}$  is the time margin required for the calculation).
2. This feature is available for the M58BW016F version, and for the M58BW016D version only if the operative frequency is below 45 MHz.
3. Y latencies can be calculated as:  $t_{KHQV} + t_{SYSTEM\ MARGIN} + t_{QVKH} < Y t_K$ .

Table 8. Burst type definition

| M 3 | Starting address | x 4 sequential | x 4 interleaved | x 8 sequential        | x 8 interleaved | Continuous                    |

Figure 4. Example Burst Configuration X-1-1-1

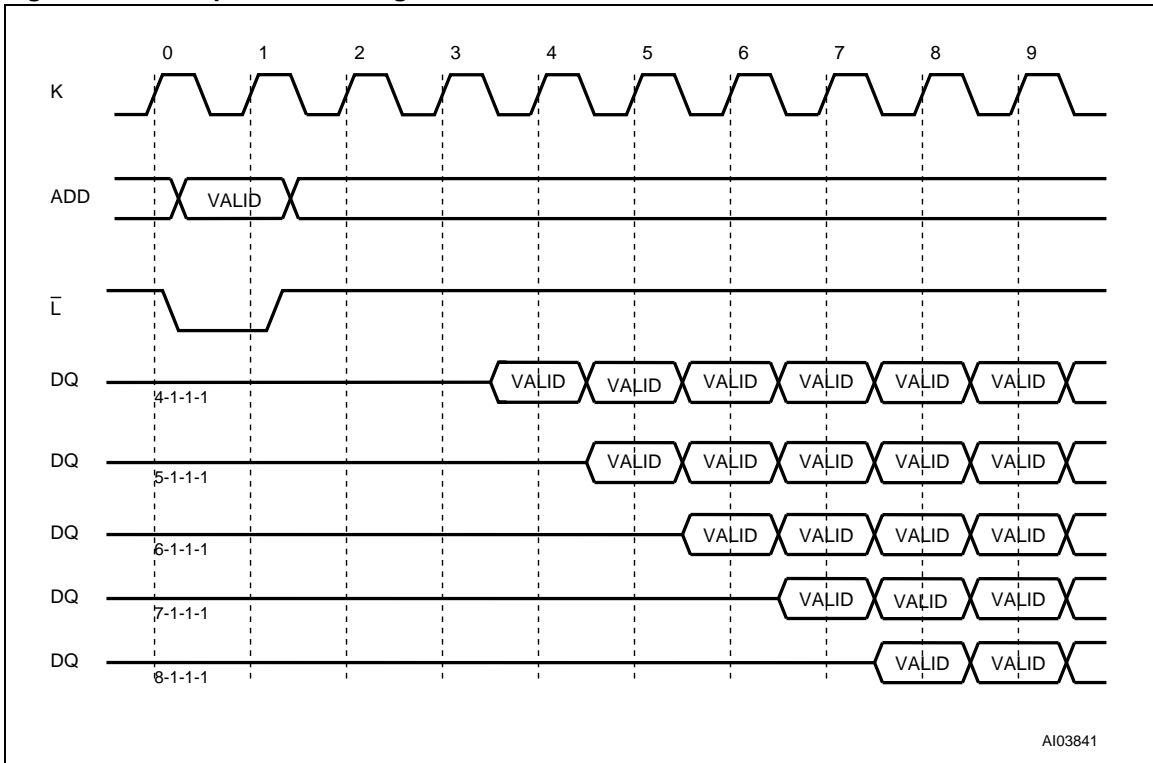

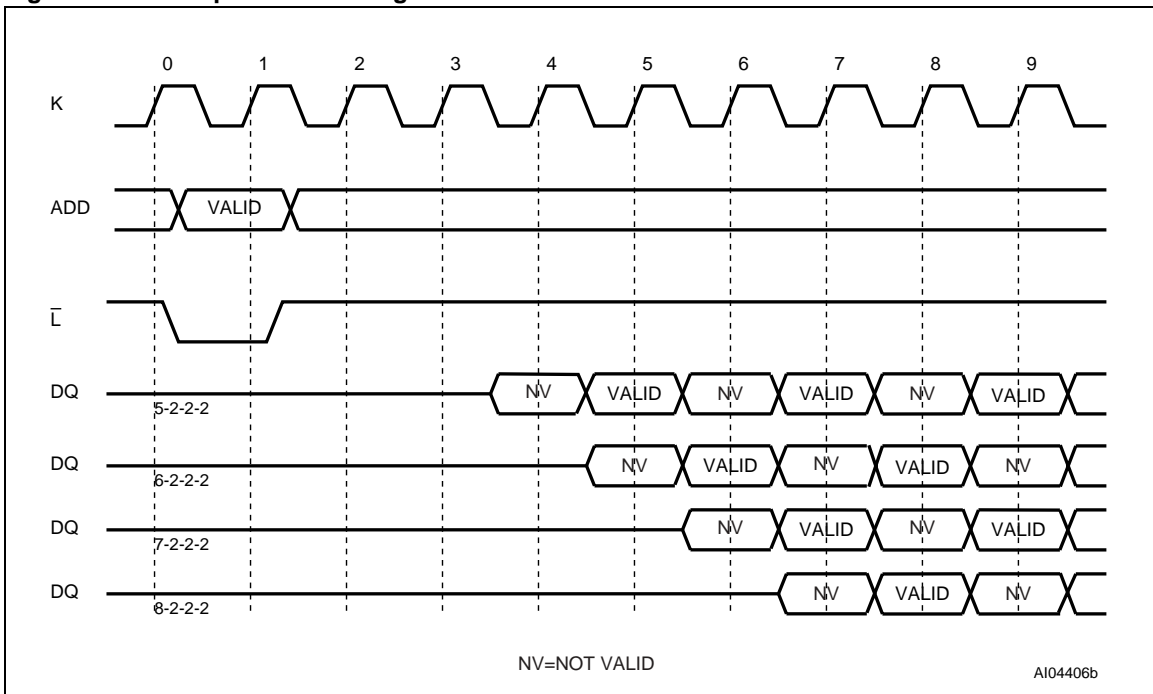

Figure 5. Example Burst Configuration X-2-2-2

## 4 Command interface

All Bus Write operations to the memory are interpreted by the command interface. Commands consist of one or more sequential Bus Write operations. The commands are summarized in [Table 9: Commands](#). Refer to [Table 9](#) in conjunction with the text descriptions below.

### 4.1 Read Memory Array command

The Read Memory Array command returns the memory to Read mode. One Bus Write cycle is required to issue the Read Memory Array command and return the memory to Read mode. Subsequent read operations will output the addressed memory array data. Once the command is issued the memory remains in Read mode until another command is issued. From Read mode Bus Read commands will access the memory array.

### 4.2 Read Electronic Signature command

The Read Electronic Signature command is used to read the manufacturer code, the device code or the Burst Configuration Register. One Bus Write cycle is required to issue the Read Electronic Signature command. Once the command is issued subsequent Bus Read operations, depending on the address specified, read the manufacturer code, the device code or the Burst Configuration Register until another command is issued; see [Table 5: Asynchronous Read Electronic Signature operation](#).

### 4.3 Read Query command

The Read Query command is used to read data from the common Flash interface (CFI) memory area. One Bus Write cycle is required to issue the Read Query command. Once the command is issued subsequent Bus Read operations, depending on the address specified, read from the common Flash interface memory area. See [Appendix A: Common Flash interface \(CFI\)](#), [Table 26](#), [Table 27](#), [Table 28](#), [Table 29](#) and [Table 30](#) for details on the information contained in the common Flash interface (CFI) memory area.

## 4.4 Read Status Register command

The Read Status Register command is used to read the Status Register. One Bus Write cycle is required to issue the Read Status Register command. Once the command is issued subsequent Bus Read operations read the Status Register until another command is issued.

The Status Register information is present on the output data bus (DQ1-DQ7) when Chip Enable  $\bar{E}$  and Output Enable  $\bar{O}$  are at  $V_{IL}$  and Output Disable is at  $V_{IH}$ .

An interactive update of the Status Register bits is possible by toggling Output Enable or Output Disable. It is also possible during a program or erase operation, by deactivating the device with Chip Enable at  $V_{IH}$  and then reactivating it with Chip Enable and Output Enable at  $V_{IL}$  and Output Disable at  $V_{IH}$ .

The content of the Status Register may also be read at the completion of a program, erase or suspend operation. During a Block Erase or Program command, DQ7 indicates the Program/Erase controller status. It is valid until the operation is completed or suspended.

See the section on the Status Register and [Table 11](#) for details on the definitions of the Status Register bits.

## 4.5 Clear Status Register command

The Clear Status Register command can be used to reset bits 1, 3, 4 and 5 in the Status Register to '0'. One Bus Write is required to issue the Clear Status Register command. Once the command is issued the memory returns to its previous mode, subsequent Bus Read operations continue to output the same data.

The bits in the Status Register are sticky and do not automatically return to '0' when a new Program or Erase command is issued. If any error occurs then it is essential to clear any error bits in the Status Register by issuing the Clear Status Register command before attempting a new Program, Erase or Resume command.

## 4.6 Block Erase command

The Block Erase command can be used to erase a block. It sets all of the bits in the block to '1'. All previous data in the block is lost. If the block is protected then the erase operation will abort, the data in the block will not be changed and the Status Register will output the error.

Two Bus Write operations are required to issue the command; the first write cycle sets up the Block Erase command, the second write cycle confirms the Block Erase command and latches the block address in the Program/Erase controller and starts it. The sequence is aborted if the Confirm command is not given and the device will output the Status Register Data with bits 4 and 5 set to '1'.

Once the command is issued subsequent Bus Read operations read the Status Register. See the section on the Status Register for details on the definitions of the Status Register bits. During the Erase operation the memory will only accept the Read Status Register command and the Program/Erase Suspend command. All other commands will be ignored. The command can be executed using either  $V_{DD}$  (for a normal erase operation) or  $V_{PP}$  (for a fast erase operation). If  $V_{PP}$  is in the  $V_{PPH}$  range when the command is issued then a fast erase operation will be executed, otherwise the operation will use  $V_{DD}$ . If  $V_{PP}$  goes below the  $V_{PP}$  Lockout voltage,  $V_{PPLK}$ , during a fast erase the operation aborts, the Status Register  $V_{PP}$  Status bit is set to '1' and the command must be re-issued.

Typical Erase times are given in [Table 10](#).

See [Appendix B: Flowcharts, Figure 24: Block Erase flowchart and pseudocode](#), for a suggested flowchart on using the Block Erase command.

## 4.7 Program command

The Program command is used to program the memory array. Two Bus Write operations are required to issue the command; the first write cycle sets up the Program command, the second write cycle latches the address and data to be programmed in the Program/Erase controller and starts it. A program operation can be aborted by writing FFFFFFFFh to any address after the program set-up command has been given.

Once the command is issued subsequent Bus Read operations read the Status Register. See the section on the Status Register for details on the definitions of the Status Register bits. During the Program operation the memory will only accept the Read Status Register command and the Program/Erase Suspend command. All other commands will be ignored.

If Reset/Power-down,  $\overline{RP}$ , falls to  $V_{IL}$  during programming the operation will be aborted.

The command can be executed using either  $V_{DD}$  (for a normal program operation) or  $V_{PP}$  (for a fast program operation). If  $V_{PP}$  is in the  $V_{PPH}$  range when the command is issued then a fast program operation will be executed, otherwise the operation will use  $V_{DD}$ . If  $V_{PP}$  goes below the  $V_{PP}$  Lockout voltage,  $V_{PPLK}$ , during a fast program the operation aborts and the Status Register  $V_{PP}$  Status bit is set to '1'. As data integrity cannot be guaranteed when the program operation is aborted, the memory block must be erased and reprogrammed.

See [Appendix B: Flowcharts on page 59, Figure 22: Program flowchart and pseudocode](#), for a suggested flowchart on using the Program command.

## 4.8 Program/Erase Suspend command

The Program/Erase Suspend command is used to pause a program or erase operation. The command will only be accepted during a program or erase operation. It can be issued at any time during a program or erase operation. The command is ignored if the device is already in Suspend mode.

One Bus Write cycle is required to issue the Program/Erase Suspend command and pause the Program/Erase controller. Once the command is issued it is necessary to poll the Program/Erase Controller Status bit (bit 7) to find out when the Program/Erase controller has paused; no other commands will be accepted until the Program/Erase controller has paused. After the Program/Erase controller has paused, the memory will continue to output the Status Register until another command is issued.

During the polling period between issuing the Program/Erase Suspend command and the Program/Erase controller pausing it is possible for the operation to complete. Once the Program/Erase Controller Status bit (bit 7) indicates that the Program/Erase controller is no longer active, the Program Suspend Status bit (bit 2) or the Erase Suspend Status bit (bit 6) can be used to determine if the operation has completed or is suspended. For timing on the delay between issuing the Program/Erase Suspend command and the Program/Erase controller pausing see [Table 10](#).

During Program/Erase Suspend the Read Memory Array, Read Status Register, Read Electronic Signature, Read Query and Program/Erase Resume commands will be accepted by the command interface. Additionally, if the suspended operation was Erase then the Program and the Program Suspend commands will also be accepted. When a program operation is completed inside a Block Erase Suspend the Read Memory Array command must be issued to reset the device in Read mode, then the Erase Resume command can be issued to complete the whole sequence. Only the blocks not being erased may be read or programmed correctly.

See [Appendix B: Flowcharts, Figure 23: Program Suspend & Resume flowchart and pseudocode](#), and [Figure 25: Erase Suspend & Resume flowchart and pseudocode](#), for suggested flowcharts on using the Program/Erase Suspend command.

## 4.9 Program/Erase Resume command

The Program/Erase Resume command can be used to restart the Program/Erase controller after a Program/Erase Suspend operation has paused it. One Bus Write cycle is required to issue the Program/Erase Resume command.

See [Appendix B: Flowcharts, Figure 23: Program Suspend & Resume flowchart and pseudocode](#), and [Figure 25: Erase Suspend & Resume flowchart and pseudocode](#), for suggested flowcharts on using the Program/Erase Resume command.

## 4.10 Set Burst Configuration Register command

The Set Burst Configuration Register command is used to write a new value to the Burst Configuration Control Register which defines the burst length, type, X and Y latencies, Synchronous/Asynchronous Read mode and the valid Clock edge configuration.

Two Bus Write cycles are required to issue the Set Burst Configuration Register command. The first cycle writes the setup command and the address corresponding to the Set Burst Configuration Register content. The second cycle writes the Burst Configuration Register data and the confirm command. Once the command is issued the memory returns to Read mode as if a Read Memory Array command had been issued.

The value for the Burst Configuration Register is always presented on A0-A15. M0 is on A0, M1 on A1, etc.; the other address bits are ignored.

**Table 9. Commands<sup>(1)</sup>**

| Command  | Cycles | Bus operations |       |            |           |        |      |
|--|--------|----------------|-------|------------|-----------|--------|------|
|  |        | 1st cycle      |       |            | 2nd cycle |        |      |
|  |        | Op.            | Addr. | Data       | Op.       | Addr.  | Data |
| Read Memory Array  | ≥ 2    | Write          | X     | FFh        | Read      | RA     | RD   |
| Read Electronic Signature (manufacturer code)            | ≥ 2    | Write          | X     | 90h        | Read      | 00000h | 20h  |
| Read Electronic Signature (device code)                  | ≥ 2    | Write          | X     | 90h        | Read      | 00001h | IDh  |
| Read Electronic Signature (Burst Configuration Register) | ≥ 2    | Write          | X     | 90h        | Read      | 00005h | BCRh |
| Read Status Register                                     | 2      | Write          | X     | 70h        | Read      | X      | SRDh |
| Read Query   | ≥ 2    | Write          | X     | 98h        | Read      | QAh    | QDh  |
| Clear Status Register                                    | 1      | Write          | X     | 50h        |           |        |      |
| Block Erase  | 2      | Write          | X     | 20h        | Write     | BAh    | D0h  |
| Program  | 2      | Write          | X     | 40h<br>10h | Write     | PA     | PD   |
| Program/Erase Suspend                                    | 1      | Write          | X     | B0h        |           |        |      |
| Program/Erase Resume                                     | 1      | Write          | X     | D0h        |           |        |      |
| Set Burst Configuration Register                         | 2      | Write          | X     | 60h        | Write     | BCRh   | 03h  |

1. X = Don't care; RA = Read Address, RD = Read Data, ID = Device Code, SRD = Status Register Data, PA = Program Address; PD = Program Data, QA = Query Address, QD = Query Data, BA = Any address in the Block, BCR = Burst Configuration Register value.

Table 10. Program, erase times and program, erase endurance cycles<sup>(1)</sup>

1.  $T_A = -40$  to  $125\text{ }^\circ\text{C}$ ,  $V_{DD} = 2.7\text{ V}$  to  $3.6\text{ V}$ ,  $V_{DDQ} = 2.4\text{ V}$  to  $V_{DD}$ .

## 5 Status Register

The Status Register provides information on the current or previous program or erase operation. The various bits in the Status Register convey information and errors on the operation. They are output on DQ7-DQ0.

To read the Status Register the Read Status Register command can be issued. The Status Register is automatically read after Program, Erase or Program/Erase Resume commands. The Status Register can be read from any address.

The contents of the Status Register can be updated during an erase or program operation by toggling the Output Enable or Output Disable pins or by deactivating (Chip Enable,  $V_{IH}$ ) and then reactivating (Chip Enable and Output Enable,  $V_{IL}$ , and Output Disable,  $V_{IH}$ ) the device.

The Status Register bits are summarized in [Table 11: Status Register bits](#). Refer to [Table 11](#) in conjunction with the following text descriptions.

### 5.1 Program/Erase Controller Status (bit 7)

The Program/Erase Controller Status bit indicates whether the Program/Erase controller is active or inactive. When the Program/Erase Controller Status bit is set to '0', the Program/Erase controller is active; when bit7 is set to '1', the Program/Erase controller is inactive.

The Program/Erase Controller Status is set to '0' immediately after a Program/Erase Suspend command is issued until the Program/Erase controller pauses. After the Program/Erase controller pauses the bit is set to '1'.

During program and erase operations the Program/Erase Controller Status bit can be polled to find the end of the operation. The other bits in the Status Register should not be tested until the Program/Erase controller completes the operation and the bit is set to '1'.

After the Program/Erase controller completes its operation the Erase Status (bit5), Program Status bits should be tested for errors.

### 5.2 Erase Suspend Status (bit 6)

The Erase Suspend Status bit indicates that an erase operation has been suspended and is waiting to be resumed. The Erase Suspend Status should only be considered valid when the Program/Erase Controller Status bit is set to '1' (Program/Erase controller inactive); after a Program/Erase Suspend command is issued the memory may still complete the operation rather than entering the Suspend mode.

When the Erase Suspend Status bit is set to '0', the Program/Erase controller is active or has completed its operation; when the bit is set to '1', a Program/Erase Suspend command has been issued and the memory is waiting for a Program/Erase Resume command.

When a Program/Erase Resume command is issued the Erase Suspend Status bit returns to '0'.

### 5.3 Erase Status (bit 5)

The Erase Status bit can be used to identify if the memory has failed to verify that the block has erased correctly. The Erase Status bit should be read once the Program/Erase Controller Status bit is High (Program/Erase controller inactive).

When the Erase Status bit is set to '0', the memory has successfully verified that the block has erased correctly. When the Erase Status bit is set to '1', the Program/Erase controller has applied the maximum number of pulses to the block and still failed to verify that the block has erased correctly.

Once set to '1', the Erase Status bit can only be reset to '0' by a Clear Status Register command or a hardware reset. If set to '1' it should be reset before a new Program or Erase command is issued, otherwise the new command will appear to fail.

### 5.4 Program Status (bit 4)

The Program Status bit is used to identify a program failure. Bit4 should be read once the Program/Erase Controller Status bit is High (Program/Erase controller inactive).

When bit4 is set to '0' the memory has successfully verified that the device has programmed correctly. When bit4 is set to '1' the device has failed to verify that the data has been programmed correctly.

Once set to '1', the Program Status bit can only be reset to '0' by a Clear Status Register command or a hardware reset. If set to '1' it should be reset before a new Program or Erase command is issued, otherwise the new command will appear to fail.

### 5.5 V<sub>PP</sub> Status (bit 3)

The V<sub>PP</sub> Status bit can be used to identify an invalid voltage on the V<sub>PP</sub> pin during fast program and erase operations. The V<sub>PP</sub> pin is only sampled at the beginning of a program or erase operation. Indeterminate results can occur if V<sub>PP</sub> becomes invalid during a fast program or erase operation.

When the V<sub>PP</sub> Status bit is set to '0', the voltage on the V<sub>PP</sub> pin was sampled at a valid voltage; when the V<sub>PP</sub> Status bit is set to '1', the V<sub>PP</sub> pin has a voltage that is below the V<sub>PP</sub> Lockout voltage, V<sub>PPLK</sub>.

Once set to '1', the V<sub>PP</sub> Status bit can only be reset to '0' by a Clear Status Register command or a hardware reset. If set to '1' it should be reset before a new Program or Erase command is issued, otherwise the new command will appear to fail.

## 5.6 Program Suspend Status (bit 2)

The Program Suspend Status bit indicates that a Program operation has been suspended and is waiting to be resumed. The Program Suspend Status should only be considered valid when the Program/Erase Controller Status bit is set to '1' (Program/Erase controller inactive); after a Program/Erase Suspend command is issued the memory may still complete the operation rather than entering the Suspend mode.

When the Program Suspend Status bit is set to '0', the Program/Erase controller is active or has completed its operation; when the bit is set to '1', a Program/Erase Suspend command has been issued and the memory is waiting for a Program/Erase Resume command.

When a Program/Erase Resume command is issued the Program Suspend Status bit returns to '0'.

## 5.7 Block Protection Status (bit 1)

The Block Protection Status bit can be used to identify if a program or erase operation has tried to modify the contents of a protected block.

When the Block Protection Status bit is set to '0', no program or erase operations have been attempted to protected blocks since the last Clear Status Register command or hardware reset; when the Block Protection Status bit is set to '1', a program or erase operation has been attempted on a protected block.

Once set to '1', the Block Protection Status bit can only be reset Low by a Clear Status Register command or a hardware reset. If set to '1' it should be reset before a new Program or Erase command is issued, otherwise the new command will appear to fail.

All others bits are reserved.

**Table 11. Status Register bits**

| Bit                 | Name                               | Logic level | Definition                              |
|---------------------|------------------------------------|-------------|---|
| 7                   | Program/Erase Controller Status    | '1'         | Ready                                   |
|                     |                                    | '0'         | Busy                                    |
| 6                   | Erase Suspend Status               | '1'         | Suspended                               |
|                     |                                    | '0'         | In progress or completed                |
| 5                   | Erase Status                       | '1'         | Erase error                             |
|                     |                                    | '0'         | Erase success                           |
| 4                   | Program Status,                    | '1'         | Program error                           |
|                     |                                    | '0'         | Program success                         |
| 3                   | V <sub>PP</sub> Status             | '1'         | V <sub>PP</sub> invalid, abort          |
|                     |                                    | '0'         | V <sub>PP</sub> OK                      |
| 2                   | Program Suspend Status             | '1'         | Suspended                               |
|                     |                                    | '0'         | In progress or completed                |
| 1                   | Erase/Program in a protected block | '1'         | Program/erase on protected block, abort |
|                     |                                    | '0'         | No operations to protected sectors      |
| Other bits reserved |                                    |             |   |

## 6 Maximum ratings

Stressing the device above the ratings listed in [Table 12: Absolute maximum ratings](#), may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

**Table 12. Absolute maximum ratings**

| Symbol                       | Parameter               | Value |                                      | Unit |
|------------------------------|-------------------------|-------|--------------------------------------|------|
|                              |                         | Min   | Max                                  |      |
| $T_{BIAS}$                   | Temperature under bias  | -40   | 125                                  | °C   |
| $T_{STG}$                    | Storage temperature     | -55   | 155                                  | °C   |
| $V_{IO}$                     | Input or output voltage | -0.6  | $V_{DDQ} + 0.6$<br>$V_{DDQIN} + 0.6$ | V    |
| $V_{DD}, V_{DDQ}, V_{DDQIN}$ | Supply voltage          | -0.6  | 4.2                                  | V    |
| $V_{PP}$                     | Program voltage         | -0.6  | 13.5 <sup>(1)</sup>                  | V    |

1. Cumulative time at a high voltage level of 13.5 V should not exceed 80 hours on  $V_{PP}$  pin.

## 7 DC and AC parameters

This section summarizes the operating and measurement conditions, and the DC and AC characteristics of the device. The parameters in the DC and AC characteristics tables that follow, are derived from tests performed under the measurement conditions summarized in [Table 13: Operating and AC measurement conditions](#). Designers should check that the operating conditions in their circuit match the measurement conditions when relying on the quoted parameters.

**Table 13. Operating and AC measurement conditions**

| Parameter                                 | Value          |          | Units |    |
|---|----------------|----------|-------|----|
|   | Min            | Max      |       |    |
| Supply voltage ( $V_{DD}$ )               | 2.7            | 3.6      | V     |    |
| Input/output supply voltage ( $V_{DDQ}$ ) | 2.4            | $V_{DD}$ | V     |    |
| Ambient temperature ( $T_A$ )             | Grade 6        | -40      | 90    | °C |
|   | Grade 3        | -40      | 125   | °C |
| Load capacitance ( $C_L$ )                | 30             |          | pF    |    |
| Clock rise and fall times                 |                | 4        | ns    |    |
| Input rise and fall times                 |                | 4        | ns    |    |
| Input pulses voltages                     | 0 to $V_{DDQ}$ |          | V     |    |
| Input and output timing ref. voltages     | $V_{DDQ}/2$    |          | V     |    |

**Figure 6. AC measurement input/output waveform**

1.  $V_{DD} = V_{DDQ}$ .

1. For other timings see [Table 16: Asynchronous Bus Read AC characteristics](#).

2. Data output should be read on the valid clock edge.

**Figure 14. Synchronous Burst Read (data valid from 'n' clock rising edge)**

1. For set up signals and timings see Synchronous Burst Read.

Figure 15. Synchronous Burst Read - continuous - valid data ready output

1. Valid Data Ready = Valid Low during valid clock edge
2. V= Valid output.
3. R is an open drain output with an internal pull up resistor of 1 M $\Omega$ . The internal timing of R follows DQ. An external resistor, typically 300 k $\Omega$  for a single memory on the R bus, should be used to give the data valid set up time required to recognize that valid data is available on the next valid clock edge.

1. This time is  $t_{PHEL} + t_{AVQV}$  or  $t_{PHEL} + t_{ELQV}$ .

## 8 Package mechanical

In order to meet environmental requirements, ST offers these devices in ECOPACK<sup>®</sup> packages. ECOPACK<sup>®</sup> packages are lead-free. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label.

ECOPACK is an ST trademark. ECOPACK specifications are available at: [www.st.com](http://www.st.com).

## 9 Ordering information

Table 25. Ordering information scheme

| Example:                 | M58  | BW | 016D | T | 80 | T | 3 | F | T |
|--------------------------|--|----|------|---|----|---|---|---|---|
| <b>Device type</b>       | M58  |    |      |   |    |   |   |   |   |
| <b>Architecture</b>      | B = Burst mode   |    |      |   |    |   |   |   |   |
| <b>Operating voltage</b> | W = $V_{DD} = 2.7\text{ V to }3.6\text{ V}$ ; $V_{DDQ} = V_{DDQIN} = 2.4\text{ to }V_{DD}$                                   |    |      |   |    |   |   |   |   |
| <b>Device function</b>   | 016D = 16 Mbit (x 32), boot block, burst, 0.15 $\mu\text{m}$<br>016F = 16 Mbit (x 32), boot block, burst, 0.11 $\mu\text{m}$ |    |      |   |    |   |   |   |   |
| <b>Array matrix</b>      | T = Top boot<br>B = Bottom boot  |    |      |   |    |   |   |   |   |
| <b>Speed</b>             | 70 = 70 ns<br>80 = 80 ns   |    |      |   |    |   |   |   |   |
| <b>Package</b>           | T = PQFP80<br>ZA = LBGA 10 x 12 mm   |    |      |   |    |   |   |   |   |
| <b>Temperature range</b> | 3 = Automotive grade certified <sup>(1)</sup> , -40 to 125 °C  |    |      |   |    |   |   |   |   |
| <b>Version</b>           | F = Silicon version F  |    |      |   |    |   |   |   |   |
| <b>Option</b>            | T = Tape and reel packing<br>F = ECOPACK package, tape and reel packing  |    |      |   |    |   |   |   |   |

1. Qualified & characterized according to AEC Q100 & Q003 or equivalent, advanced screening according to AEC Q001 & Q002 or equivalent.

**Note:** *Devices are shipped from the factory with the memory content bits erased to '1'.  
For a list of available options (speed, package, etc.) or for further information on any aspect of this device, please contact the ST Sales Office nearest to you.*

## Appendix A Common Flash interface (CFI)

The common Flash interface is a JEDEC approved, standardized data structure that can be read from the Flash memory device. It allows a system software to query the device to determine various electrical and timing parameters, density information and functions supported by the memory. The system can interface easily with the device, enabling the software to upgrade itself when necessary.

When the CFI Query command (RCFI) is issued the device enters CFI Query mode and the data structure is read from the memory. [Table 26](#), [Table 27](#), [Table 28](#), [Table 29](#) and [Table 30](#) show the addresses used to retrieve the data.

**Table 26. Query structure overview**

| Offset              | Sub-section name                                  | Description   |
|---------------------|---|---|
| 00h                 |   | Manufacturer code   |
| 01h                 |   | Device code   |
| 10h                 | CFI Query identification string                   | Command set ID and algorithm data offset                              |
| 1Bh                 | System interface information                      | Device timing and voltage information                                 |
| 27h                 | Device geometry definition                        | Flash memory layout   |
| P(h) <sup>(1)</sup> | Primary algorithm-specific extended query table   | Additional information specific to the primary algorithm (optional)   |
| A(h) <sup>(2)</sup> | Alternate algorithm-specific extended query table | Additional information specific to the alternate algorithm (optional) |

1. Offset 15h defines P which points to the primary algorithm extended query address table.
2. Offset 19h defines A which points to the alternate algorithm extended query address table.

**Table 27. CFI - query address and data output<sup>(1)(2)</sup>**

| Address A0-A18 | Data |     | Instruction   |
|----------------|------|-----|---|
| 10h            | 51h  | "Q" | 51h; "Q"<br>Query ASCII String 52h; "R"<br>59h; "Y" |
| 11h            | 52h  | "R" |   |
| 12h            | 59h  | "Y" |   |
| 13h            | 03h  |     | Primary vendor:                                     |
| 14h            | 00h  |     | Command set and control interface ID code           |
| 15h            | 35h  |     | Primary algorithm extended query address table:     |
| 16h            | 00h  |     | P(h)  |
| 17h            | 00h  |     | Alternate vendor:                                   |
| 18h            | 00h  |     | Command Set and Control interface ID code           |
| 19h            | 00h  |     | Alternate algorithm extended query address table    |
| 1Ah            | 00h  |     |   |

1. The x 8 or Byte Address and the x 16 or Word Address mode are not available.
2. Query Data are always presented on DQ7-DQ0. DQ31-DQ8 are set to '0'.

**Table 28. CFI - device voltage and timing specification**

| Address A0-A18 | Data               | Description  |
|----------------|--------------------|--|
| 1Bh            | 27h <sup>(1)</sup> | V <sub>DD</sub> min, 2.7 V   |
| 1Ch            | 36h <sup>(1)</sup> | V <sub>DD</sub> max, 3.6 V   |
| 1Dh            | B4h <sup>(2)</sup> | V <sub>PP</sub> min  |
| 1Eh            | C6h <sup>(2)</sup> | V <sub>PP</sub> max  |
| 1Fh            | 04h                | 2 <sup>n</sup> ms typical time-out for Word, DWord prog – not available  |
| 20h            | 00h                | 2 <sup>n</sup> ms, typical time-out for max buffer write – not available |
| 21h            | 0Ah                | 2 <sup>n</sup> ms, typical time-out for Erase Block                      |
| 22h            | 00h                | 2 <sup>n</sup> ms, typical time-out for chip erase – not available       |
| 23h-24h        | Reserved           |  |
| 25h            | 04h                | 2 <sup>n</sup> x typical for individual block erase time-out maximum     |
| 26h            | 00h                | 2 <sup>n</sup> x typical for chip erase max time-out – not available     |

1. Bits are coded in binary code decimal, bit7 to bit4 are scaled in Volts and bit3 to bit0 in mV.
2. Bit7 to bit4 are coded in hexadecimal and scaled in Volts while bit3 to bit0 are in binary code decimal and scaled in 100 mV.

**Table 29. Device geometry definition**

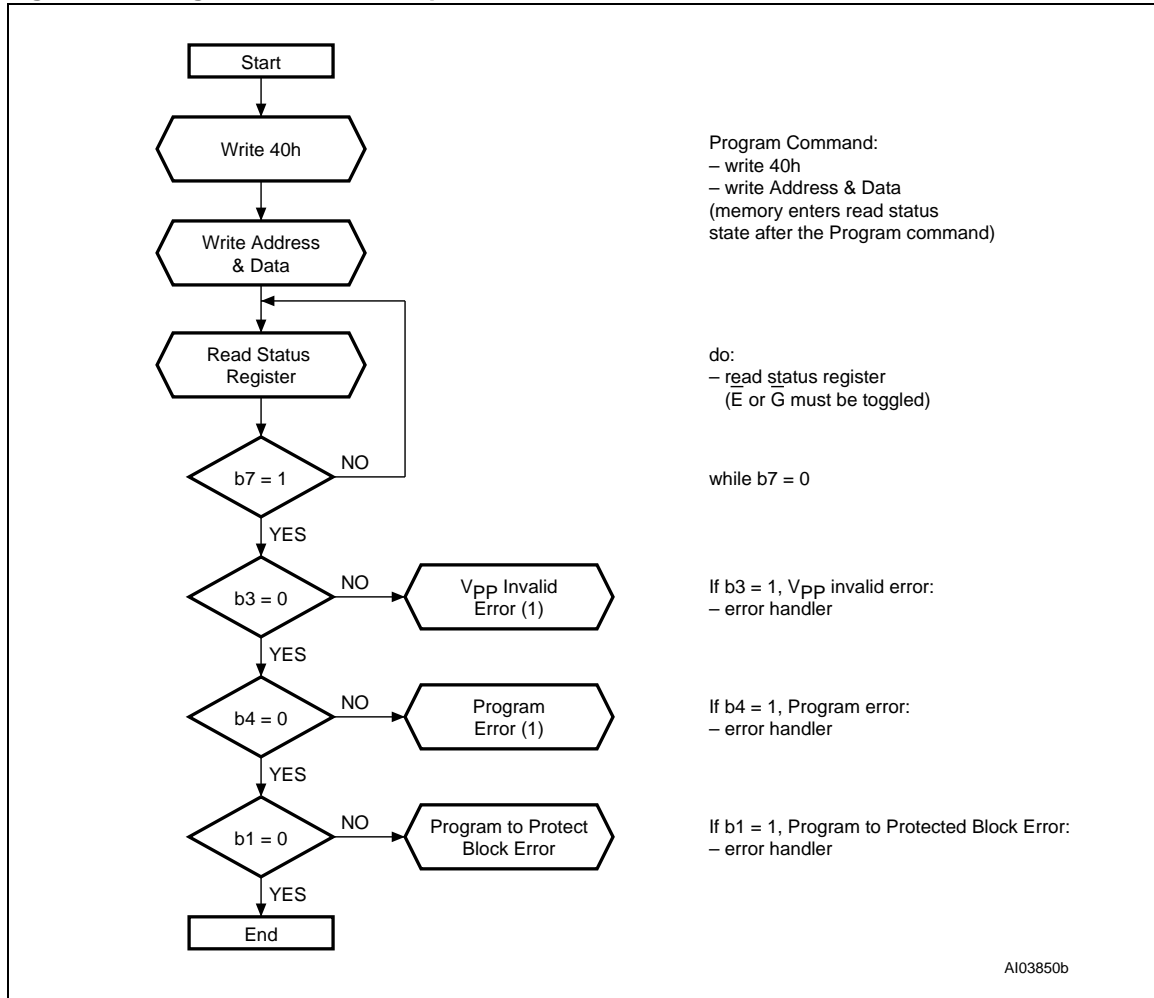

| Address A0-A18 | Data | Description  |
|----------------|------|--|
| 27h            | 15h  | 2 <sup>n</sup> number of bytes memory size                             |
| 28h            | 03h  | Device interface sync./async.  |
| 29h            | 00h  | Organization sync./async.  |
| 2Ah            | 00h  | Page size in bytes, 2 <sup>n</sup>                                     |
| 2Bh            | 00h  |  |
| 2Ch            | 02h  | Bit7-0 = number of Erase Block regions in device                       |
| 2Dh            | 1Eh  | Number (n-1) of blocks of identical size; n=31                         |
| 2Eh            | 00h  |  |
| 2Fh            | 00h  | Erase Block region information x 256 bytes per Erase Block (64 Kbytes) |
| 30h            | 01h  |  |
| 31h            | 07h  | Number (n-1) of blocks of identical size; n=8                          |
| 32h            | 00h  |  |
| 33h            | 20h  | Erase Block region information x 256 bytes per Erase Block (8 Kbytes)  |
| 34h            | 00h  |  |

**Table 30. Extended query information**

| Address offset | Address A18-A0 | Data (Hex) |     | Description   |
|----------------|----------------|------------|-----|---|

## 10 Revision history

**Table 31. Document revision history**

| Date         | Version | Changes   |
|--------------|---------|---|
| January-2001 | 01      | First Issue.  |
| 05-Jun-2001  | 02      | Major rewrite and restructure.  |
| 15-Jun-2001  | 03      | Nd and Ne values changed in PQFP80 package mechanical table.  |
| 17-Jul-2001  | 04      | PQFP80 package outline drawing and mechanical data table updated.   |
| 17-Dec-2001  | 05      | $t_{LEAD}$ removed from absolute maximum ratings ( <a href="#">Table 12</a> ).<br>80, 90 and 100 ns speed classes defined ( <a href="#">Table 16</a> , <a href="#">Table 17</a> , <a href="#">Table 18</a> , <a href="#">Table 19</a> and <a href="#">Table 20</a> clarified accordingly).<br><a href="#">Figure 13</a> , <a href="#">Figure 14</a> , <a href="#">Figure 15</a> and <a href="#">Figure 16</a> clarified.<br>Temperature range 3 and 6 added.<br><a href="#">Table 13</a> , <a href="#">Table 14</a> , <a href="#">Table 15</a> , <a href="#">Table 22</a> and CFI <a href="#">Table 27</a> , <a href="#">Table 28</a> , <a href="#">Table 29</a> , <a href="#">Table 30</a> clarified.<br>Document status changed from Product Preview to Preliminary Data. |
| 17-Jan-2002  | 06      | DC characteristics $I_{PP}$ , $I_{PP1}$ and $I_{DD1}$ clarified.<br>AC Bus Read characteristics timing $t_{GHQZ}$ clarified.  |
| 30-Aug-2002  | 6.1     | Revision numbering modified: a minor revision will be indicated by incrementing the tenths digit, and a major revision, by incrementing the units digit of the previous version (e.g. revision version 06 becomes 6.0).<br>References of $V_{PP}$ pin used for block protection purposes removed.<br><a href="#">Figure 8</a> modified.   |
| 4-Sep-2002   | 7.0     | Datasheet status changed from Preliminary Data to full Datasheet.<br>$t_{WLWH}$ parameter modified in <a href="#">Table 19: Asynchronous Write and Latch controlled Write AC characteristics</a> .  |
| 13-May-2003  | 7.1     | Revision history moved to end of document. $V_{PP}$ clarified in Program and Block Erase commands and Status Register, $V_{PP}$ Status bit. $V_{PPLK}$ added to DC characteristics table. Timing $t_{KHQV}$ modified.   |
| 16-Oct-2003  | 7.2     | Silicon Version added to Ordering Information Scheme.   |
| 03-Mar-2005  | 8       | Tuning block protection feature removed from the whole document and root part numbers M58BW016BT/B have been removed.<br><a href="#">Figure 22</a> , <a href="#">Figure 23</a> , <a href="#">Figure 24</a> , <a href="#">Figure 25</a> , <a href="#">Figure 26</a> and <a href="#">Figure 28</a> updated.<br>LBGA80 package (ZA) removed. Lead-free option added.<br>90 and 100 ns access times removed and 70 ns added.<br>Temperature range 6 removed from <a href="#">Table 25: Ordering information scheme</a> .  |
| 06-Sep-2005  | 9       | Load capacitance updated in <a href="#">Table 13: Operating and AC measurement conditions</a> .   |
| 3-Mar-2006   | 10      | Updated <a href="#">Table 25: Ordering information scheme on page 55</a> and Disclaimer information. Converted document to new template.  |
| 16-Jun-2006  | 11      | M58BW016FT and M58BW016FB part numbers added. Small text changes.   |

**Table 31. Document revision history (continued)**

| Date        | Version | Changes  |
|-------------|---------|--|
| 09-Nov-2006 | 12      | <p>LBGA80 package added (see <a href="#">Figure 21</a> and <a href="#">Table 24</a>).</p> <p>M58BW016FT and M58BW016FB behavior in Burst mode specified under <a href="#">Section 3.2.1: Synchronous Burst Read</a>.</p> <p><math>I_{DDB}</math>, <math>I_{DD1}</math> and <math>I_{DD4}</math> current values specified for M58BW016FT and M58BW016FB in <a href="#">Table 15: DC characteristics</a>, <math>I_{DD5}</math> added.</p> <p><math>t_{VDHPH}</math> specified for M58BW016FT and M58BW016FB in <a href="#">Table 22: Reset, Power-down and Power-up AC characteristics</a>.</p> <p><math>t_{KHQX}</math> specified for M58BW016FT and M58BW016FB in <a href="#">Table 20: Synchronous Burst Read AC characteristics</a>.</p> <p>23h-24h reserved in <a href="#">Table 28: CFI - device voltage and timing specification</a>. 3Fh reserved in <a href="#">Table 30: Extended query information</a>.</p> |
| 24-Nov-2006 | 13      | <p><math>I_{DD}</math> current specified for M58BW016DT/B and M58BW016FT/B in <a href="#">Table 15: DC characteristics</a>.</p>  |
| 05-Oct-2007 | 14      | <p><a href="#">Table 7: Burst Configuration Register</a> and <a href="#">Table 22: Reset, Power-down and Power-up AC characteristics</a> updated.</p> <p>Modified values for <math>t_{LLKH}</math> in <a href="#">Table 20: Synchronous Burst Read AC characteristics</a>.</p> <p><a href="#">Figure 17: Reset, Power-down and Power-up AC waveforms - control pins low</a> updated and <a href="#">Figure 18: Reset, Power-down and Power-up AC waveforms - control pins toggling</a> added.</p> <p>Small text changes.</p>   |
| 16-Jan-2008 | 15      | <p>Added: <a href="#">Figure 19: Power supply slope specification</a> and <a href="#">Table 21: Power supply AC and DC characteristics</a>.</p> <p>Changed mechanical data of the LBGA package and the description for the 010 value of M13 M11 bits in <a href="#">Table 7: Burst Configuration Register</a>.</p> <p>Minor text changes.</p>  |
