

UC3848

LINEAR INTEGRATED CIRCUIT

HIGH PERFORMANCE CURRENT MODE CONTROLLERS

DESCRIPTION

The UTC **UC3848** is designed to provide several special enhancements to satisfy the needs: Power-Saving mode for low standby power, Over Current Protection (OCP), Over Voltage Protection (OVP), Over Load Protection (OLP), Over Temperature Protection (OTP) etc protection features. IC will be shutdown when either protection arise and can auto-restart. UVLO featuring typical start-up current 20 μ A, and $V_{CC(ON)}$ 12.6V, $V_{CC(OFF)}$ 8.1V. Lower typical operation current I_{CC} 3.7mA at inactive output. The output stage, suitable for driving N-Channel MOSFETs, can operate to duty cycles approach 70%. The **UC3848** are fully pin-to-pin compatible with UC3842 except V_{REF} -pin and NC-pin. V_{REF} -pin's application as application circuits. Pin FB with an 4k Ω pull up resistor to internal reference voltage. The **UC3848** also have soft-start function avoiding overshoot, and controlled driver output rise edge time t_R for low EMI.

FEATURES

- * Low startup and operation current
- * 68kHz switching frequency
- * Max duty cycle 70%
- * Power-saving mode for low power
- * Under voltage lockout with hysteresis
- * Over temperature protection
- * Overload protection
- * Over voltage protection
- * Leading edge blanking
- * Soft start

ORDERING INFORMATION

■ FUNCTIONAL DESCRIPTION

The internal reference voltages and bias circuit work at $V_{CC} > 12.6V$, and shutdown at $V_{CC} < 8.1V$.

(1) Soft-Start

When every IC power on, driver output duty cycle will be decided by voltage V_{SS} on soft-start capacitor and V_{CS} on current sense resistor at beginning. After V_{SS} reach 5.1V, the whole soft-start phase end, and driver duty cycle depend on V_{FB} and V_{CS} . The relation among V_{SS} , V_{FB} and V_{OUT} as followed FIG.3, here soft-start phase $T_{soft-start}$ should more than V_{OUT} start-up phase $T_{start-up}$, otherwise, IC will enter false OLP protection state. Because after the soft-start phase end, if V_{OUT} remain in lower voltage, V_{FB} more than 4.6V, then IC enter false OLP state.

Furthermore, soft-start phase should end before V_{CC} reach $V_{CC(MIN)}$ during V_{CC} power on. Otherwise, if soft-start phase remain not end before V_{CC} reach $V_{CC(MIN)}$ during V_{CC} power on, IC will enter auto-restart phase and not set up V_{OUT} .

Finally soft-start also set OVP active phase. OVP active phase between $V_{SS}=0$ and $V_{SS}=3.8V$, OVP will not be sensed after V_{SS} reach 3.8V. The Soft-start phase T_{SS} :

$$T_{SS} = \begin{cases} 6 \text{ ms} & (C_{SS}=0.05\mu F) \\ 12 \text{ ms} & (C_{SS}=0.1\mu F) \\ 120 \text{ ms} & (C_{SS}=1\mu F) \end{cases}$$

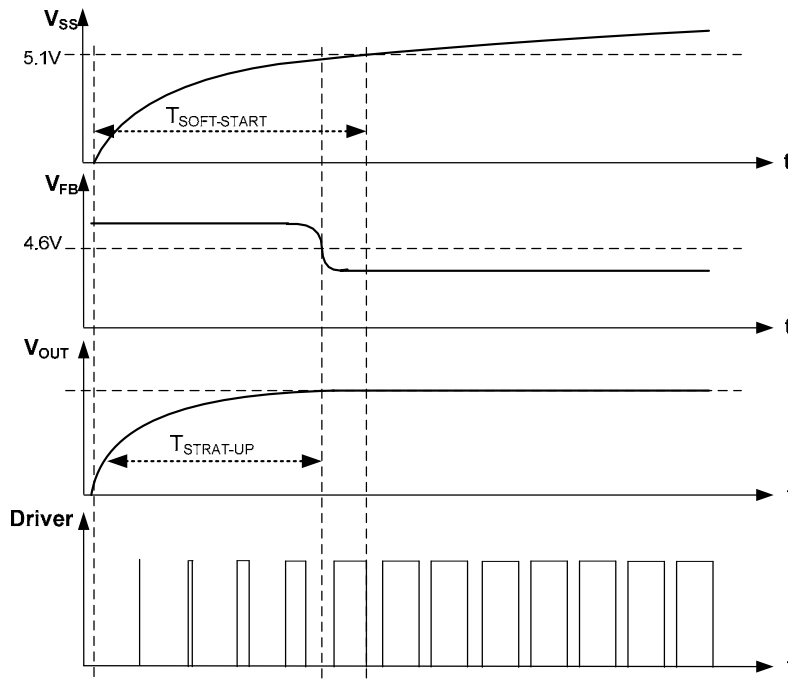

FIG.3 Soft-start phase

■ FUNCTIONAL DESCRIPTION(Cont.)

(2) Switch Frequency Set

The maximum switch frequency is 68KHz. The switch frequency is also modulated by output power P_{OUT} during IC operating. Lower switch frequency at lower load can improve IC's standby efficiency. Switch frequency is decreased minimum at no load, then the **UC3848** will operate at Power-Saving mode for Lower standby power. The relation curve between f_{SW} and P_{OUT} as followed FIG.4.

FIG.4 The relation curve between f_{SW} and output power P_{OUT}

FUNCTIONAL DESCRIPTION(Cont.)

(3) Protection section

UC3848 takes on more protection functions such as OLP, OVP and OTP etc. In case of those failure modes for continual 7.2 μ s (blanking time), the driver is shut down. At the same time, IC enters auto-restart, V_{CC} power on and driver is reset after V_{CC} power on again.

OLP

After soft-start phase end (V_{SS}>5.1V), IC will shutdown driver if over load state occurs (corresponding to V_{FB}>4.6V) for continual 7.2 μ s. OLP function will not inactive during soft-start phase. OLP case as followed FIG.6. The test circuit as followed FIG.8.

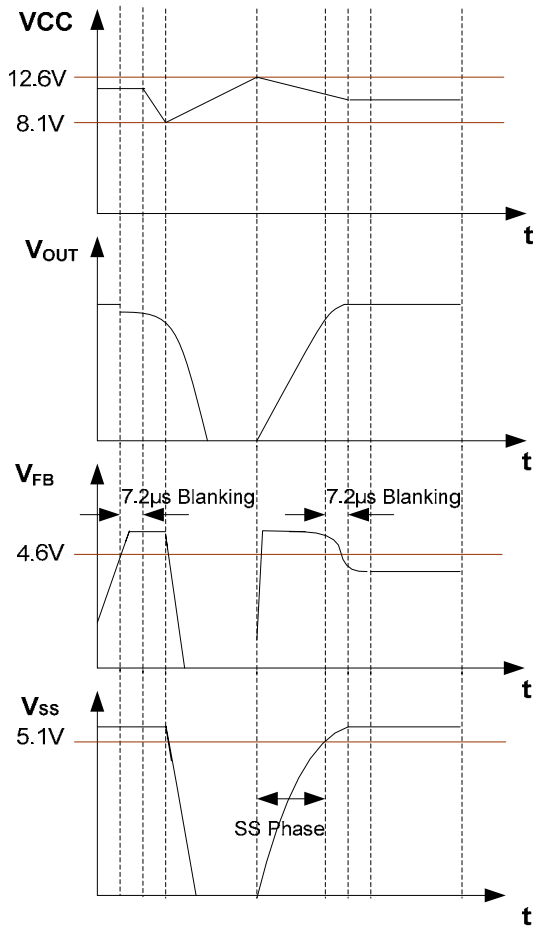

FIG.6 OLP case

FIG.7 OVP case

OVP

Power supply V_{CC}'s OVP function are enabled only when V_{SS}<3.9V & V_{FB}>4.6V during soft-start phase. During above condition, driver will be shutdown if over voltage state occurs (V_{CC}>16V) for continual 7.2 μ s. OVP function will not inactive after soft-start phase. OLP case as followed FIG.7. The test circuit as followed FIG.9.

OTP

OTP will shut down driver when junction temperature T_J of internal circuits is more than threshold 135°C for continual 7.2 μ s.

FUNCTIONAL DESCRIPTION(Cont.)

FIG.8 OLP test circuit

FIG.9 OVP test circuit

(4) Driver Output Section

Rise edge time of driver output is about 200ns for avoiding Low EMI. When driver output $V_{OL(MAX)}$ is less than 2.5V with 200mA source current, and $V_{OH(MIN)}$ is more than 12.2V with 200mA sink current.

FIG.10 driver test circuit with sink current

FIG.11 driver test circuit with source current

(5) External power switch MOS transistor

Because UC3848 driver output voltage Low level threshold is about 2.5V, User may apply power MOS transistors with bigger threshold. 4N60 is recommended normally.
