Lithium-Ion Battery Charge Control (1 cell)
Monolithic IC MM1438

Outline

This IC is a charge control IC for 1-cell lithium-ion batteries, and provides higher precision charge voltage and smaller size than MM1332 (conventional charge control IC). It incorporates a low voltage circuit (operates when SW2 = L) to disable charging low voltage batteries (2.15V typ.). When SW2 = H, the low voltage circuit is turned off so that low voltage batteries can be charged.
