

## TV-Stereo-Sound

TDA 6612-2

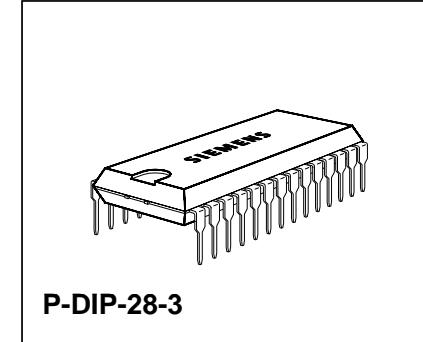

Preliminary Data

Bipolar IC

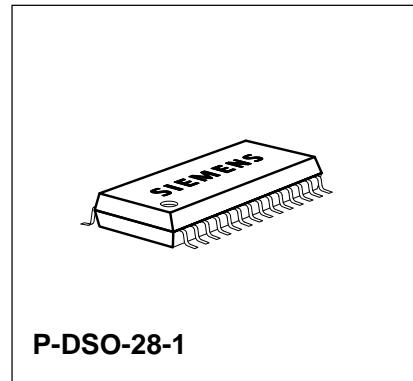

### Features

The TDA 6612-2 represents a complete TV-stereo system controlled by the I<sup>2</sup>C Bus according to German TV-Stereo standard.

- All functions inclusive matrix adjustment are I<sup>2</sup>C Bus controlled
- Inputs for AM sound or NICAM
- SCART-interface
- Independent headphones
- Universal clock generation circuit build-in
- Clipping detector build-in
- Volume control
- High signal-to-noise ratio
- Extremely low total harmonic distortions
- High security for the detection of the identification signals because of the digital interference suppression and the very narrow bandwidth

P-DIP-28-3

P-DSO-28-1

| Type        | Ordering Code | Package    |
|-------------|---------------|------------|
| TDA 6612-2  | Q67000-A5097  | P-DIP-28-3 |
| TDA 6612-2X | Q67000-A5194  | P-DSO-28-1 |

---

The IC is divided into three functional blocks

**1 Stereo Sound Processing with High Performance (exceeds DIN 45500; suitable for NICAM and CD)**

- a) Matrix for G-standard with crosstalk compensation controlled via the I<sup>2</sup>C Bus
- b) Additional single channel AF input (for e.g. AF signal according to L-standard)
- c) Stereo SCART interface according to FTZ-official specification
- d) Stereo loudspeaker signal section with Ch1/Ch2 switch, bass/treble control, quasi stereo/stereo base width expansion and separate loudspeaker volume control for left and right (balance)
- e) Separate stereo head phone signal section with Ch1/Ch2 switch and volume control

**2 TV-Sound Identification Signal Decoder Consisting of:**

- a) Active pilot signal filter
- b) Phase independent rectifier with very narrow bandwidth for evaluation of the identification signal
- c) Digital integrator to reduce interferences by noise
- d) Multiplexer for cyclical switch over between "stereo" or "dual" evaluation
- e) Reference signal generation with externally synchronized PLL
  - synchronization with external H-sync pulse or 62.5-kHz clock
  - build-in crystal oscillator and external 4-MHz crystal
  - external 4-MHz (or 1-MHz) clock signal

**3 Control Section for:**

- a) I<sup>2</sup>C Bus interface with listen/talk function
- b) Control of the complete AF-sound signal detector
- c) Read access to the clipping detector
- d) Control of the identification signal decoder
- e) Reading of the status of the identification signal decoder
- f) Test modes

## Circuit Description

### Signal Section

The audio signal processing in the matrix and the switch-over for multi channel TV-sound signals according to the two carrier system used in Germany takes place in the matrix and switching sections. Crosstalk compensation is carried out in the sound 1 input stage. The crosstalk compensation range has an adjustment range of  $\pm 3$  dB with a step width of 0.2 dB. In addition to the two inputs for the demodulated sound carrier a two channel SCART-input and an additional mono input (e.g. for demodulated L-standard sound) are provided. The two AF (pin 1 and pin 2) inputs can be bypassed internally in such a way that decoded stereo sound of other audio systems (NICAM) can be processed. The switching section includes also the SCART-output with the possibility to select the sound 1 or 2 during the "dual" mode. The Ch1/Ch2-switches for the loudspeaker and headphone outputs are independently switchable.

In the signal path for the volume control unit output there is the Ch1/Ch2-switch followed by two different volume control units. The first has a control range from 0 to  $-15$  dB with a step width of 1.25 dB. In conjunction with the main volume control after bass and treble control a high immunity against overdriving the output stage is reached. The first volume control is used as a "pre-stage" of the main volume control in conjunction with the clipping detector. This section is followed by a switchable quasi stereo stage which provides a stereophonic audio effect with mono signals due to a  $180^\circ$  phase shift at medium frequencies (about 1 kHz) in one channel. The following bass control has a control range of  $+15/-12$  dB with a step width of 3 dB. The cut-off frequency for each channel is set with an external capacitor. The implemented switchable circuit for stereo base width expansion provides a three dimensional aural reception. This is realized with a 50% frequency dependent crosstalk with opposite phase of the signal between both channels. The circuit operates with the same cut-off frequency as the bass control, but the function is widely independent. The treble control has a step width of 3 dB with a control range of  $+/-12$  dB. The cut-off frequency of the treble control is derived from one capacitor for each channel. The loudspeaker signal path is terminated with the loudspeaker control, independently adjustable for left and right. With 57 steps of 1.25 dB the adjustment range is 70 dB, where step 57 activates the "MUTE" function. Functions such as "balance" or "loudness" are realized by software and adjustment of the appropriate tone and volume controls. In the volume control unit there is a clipping detector. The status of the clipping detector can be evaluated via the I<sup>2</sup>C Bus. Therefore it is possible to implement an automatic volume control using the clipping detector and software implemented into the controller.

After every evaluation the clipping bit is reset. Therefore after a read access to the clipping bit a new evaluation of the clipping detector status is possible.

The signal path for the headphones contains a volume control after the Ch1/Ch2-switch with a common adjustment for left and right. Thirty two steps of 2 dB give an adjustment range of 62 dB ( $31 \times 2$  dB = 62 dB, the 32nd step is MUTE).

### Identification Signal Decoder

The input of the identification signal decoder consists of an op-amp for the pilot signal with its side bands. An external LC-circuit is used. The signal is then passed to a phase independent active band-pass filter with a very narrow bandwidth (adjustable externally). This filter detects whether the lower side band of the pilot carrier, which is modulated with the identification signal, is present. The

center frequency of the filter is switched between "dual" and "stereo" by a multiplexer. The multiplexing frequency is adjustable by software. If a side band is detected, the multiplexer stops. The interferences on the first "detected" criterion are suppressed by a digital integrator with a following comparator and can be read out via I<sup>2</sup>C Bus (talk mode) as the "stereo" or "dual" mode. The control of the corresponding signal can be either directly internally or through the µC. All the necessary clock signal are derived from a fast setting PLL which is synchronized by a reference frequency. This reference frequency must be sufficiently close to the horizontal frequency, but a **rigid phase coupling is not required**. Therefore, alternatively the use of a crystal controlled 62.5-kHz frequency commonly found in PLL-tuning systems is possible. A further alternative for the clock signal generation is a build-in crystal oscillator with an external 4-MHz crystal or the use an external 1- or 4-MHz clock frequency.

### Control Section

All functions are controlled via an I<sup>2</sup>C Bus interface with "listen" / "talk" functions. The data bytes currently used are stored in a block of latches.

The telegram structure is formed in the following manner:

start condition - chip address - any number of bytes - stop condition

The following conditions apply to the data bytes:

Before the actual data byte (with the adjustment information), **always** an I<sup>2</sup>C Bus sub-address byte has to be transmitted. The I<sup>2</sup>C Bus interface however is interpreting this sub-address byte as a data byte.

Example: The headphone volume is to be increased in a number of steps.

| Right                      | Wrong                      |
|----------------------------|----------------------------|
| Start condition            | Start condition            |
| Chip address 84 (Hex)      | Chip address 84 (Hex)      |
| Sub-addr. vol. HP 03 (Hex) | Sub-addr. vol. HP 03 (Hex) |
| Vol. step 8 08 (Hex)       | Vol. step 8 08 (Hex)       |
| Sub-addr. vol. HP 03 (Hex) | Vol. step 9 09 (Hex)       |
| Vol. step 9 09 (Hex)       | Vol. step 10 0A (Hex)      |
| Sub-addr. vol. HP 03 (Hex) | Stop condition             |
| Vol. step 10 0A (Hex)      |                            |
| Stop condition             |                            |

Within a telegram (i.e. without a new start condition) any different sub-addresses can be accessed. The changeover between "listen" and "talk" access to the IC however must always occur using the following sequence: stop condition - start condition - chip address. Before each read access always a start condition and chip address (talk) must be transmitted. The data to be read out are then loaded into the I<sup>2</sup>C Bus interface and can be transferred to the µC.

**Chip Address**

## Characteristics

$V_S = 12 \text{ V}$ ;  $T_A = 25^\circ\text{C}$ , audio reference level 0 dB–250 mVrms, if not differently defined.

I<sup>2</sup>C Bus preset: start - 84 - 01,3F - 0 2,3F - 04,00 - 0 3,1F - 0 5,88 - 0 6,10 - 07,C8 - 00,01 - stop

Chip address -  $\text{Vol}_{LSI} 63$  -  $\text{Vol}_{LSr} 63$  -  $\text{Vol}_{VLs}$  -  $\text{Vol}_{HP} 31$  - Sound lin Adjust 0dB - MUTE I, MUTE II, Mono - Bypass

The basic setting for each point in the specification is always preset; only settings which deviate from this are given in the test conditions. Details in *italics* only provide explanation of the hexadecimal codes. If switch byte are mentioned only the bit status and activated features are indicated.

## Test Circuit 4

Application Circuit 3

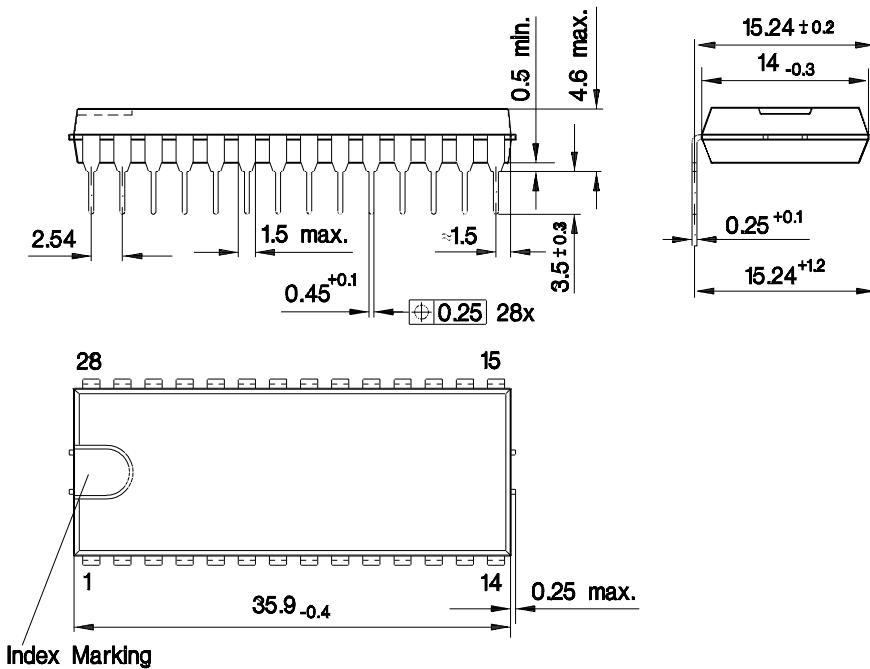

**I<sup>2</sup>C Bus Timing Diagram**

|             |                            |
|-------------|----------------------------|
| $t_{SUSTA}$ | Setup time (start)         |
| $t_{HDSTA}$ | Hold time (start)          |
| $t_{HIGH}$  | H-pulse width (clock)      |
| $t_{LOW}$   | L-pulse width (clock)      |
| $t_{SUDAT}$ | Setup time (data transfer) |
| $t_{HDDAT}$ | Hold time (data transfer)  |
| $t_{SUSTO}$ | Setup time (stop)          |
| $t_{BUF}$   | Bus free time              |
| $t_F$       | Fall time                  |
| $t_R$       | Rise time                  |

All times referred to  $V_{IH}$  and  $V_{IL}$  values.

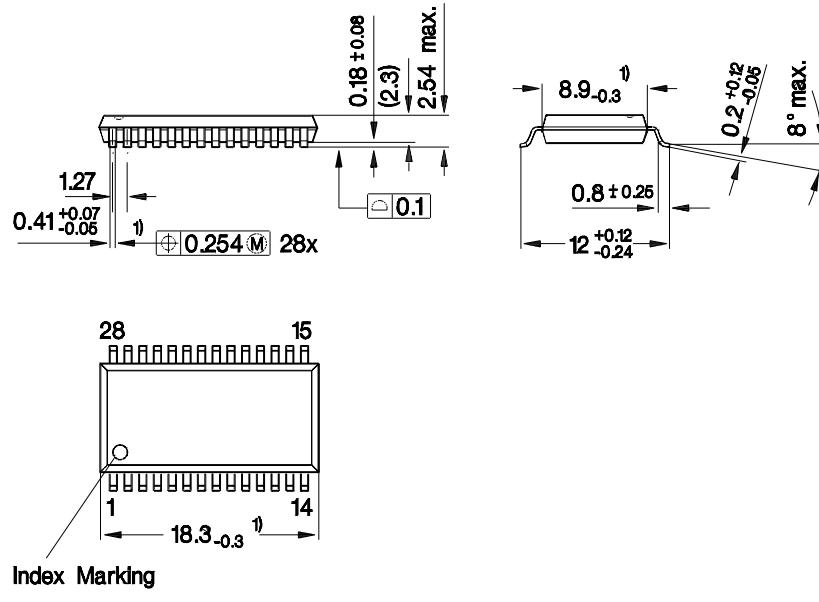

**Package Outlines**

**Plastic Package, P-DIP-28-1**  
(Plastic Dual In-Line Package)

GPD05037

**Plastic Package, P-DSO-28.350 (SMD)**  
(Plastic Dual Small Outline)

- 1) Does not include plastic or metal protrusion of 0.25 max. per side
- 2) Does not include dambar protrusion

GPS05182

#### Sorts of Packing

Package outlines for tubes, trays etc. are contained in our Data Book "Package Information"

SMD = Surface Mounted Device

Dimensions in mm
