

SSL1623PH

SMPS ICs for mains LED drivers

Rev. 01 — 15 September 2008

Product data sheet

1. General description

The SSL1623PH is a Switched Mode Power Supply (SMPS) controller IC that operates directly from the rectified universal mains. It is implemented in the high voltage EZ-HV SOI (Easy High Voltage Silicon-On-Insulator) process, combined with a low voltage BiCMOS (Bipolar Complementary Metal Oxide Semiconductor) process.

The device includes a high voltage power switch and a circuit for start-up directly from the rectified mains voltage. A dedicated circuit for valley switching is built in, which makes a very efficient slim-line electronic LED driver concept possible.

The SSL1623PH can operate in LED applications with a power range of up to 25 W. The SSL152x family would be a better choice if power below 15 W is required.

In its most basic version of application the SSL1623PH acts as a voltage source. Here no additional secondary electronics are required. A combined voltage and current source can be realized with minimum costs for external components. Implementation of the SSL1623PH renders an efficient and low cost LED power supply system.

2. Features

- Integrated power switch: 6.5 Ω and 650 V
- Operates from universal AC mains supplies, 80 V to 276 V
- Adjustable frequency for flexible design
- RC oscillator for load insensitive regulation loop constant
- Valley switching for minimum switch-on loss
- Adjustable overcurrent protection
- Undervoltage protection
- Temperature protection
- Short circuit winding protection
- Safe restart mode for system fault conditions
- Simple application with both primary and secondary (opto) feedback
- Available in 16-pin DIP package

3. Applications

- LED ballasts
- Contour lighting
- LED spotlights
- Channel letter lighting
- Down lighting

- Commercial lighting (e.g. retail displays)

4. Quick reference data

Table 1. Quick reference data

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{CC}	supply voltage	continuous	[1] -0.4	-	+40	V
V_{DRAIN}	voltage on pin DRAIN		-0.4	-	+650	V
I_{DRAIN}	current on pin DRAIN	no auxiliary supply	-	0.5	-	mA
R_{DSon}	drain-source on-state resistance	$I_{source} = -0.5$ A				
		$T_j = 25$ °C	-	6.5	7.5	Ω
		$T_j = 100$ °C	-	9.0	10.0	Ω
f_{osc}	oscillator frequency		10	-	200	kHz
T_{amb}	ambient temperature		-20	-	+85	°C

[1] Pins V_{CC} and RC are not allowed to be current driven.

5. Ordering information

Table 2. Ordering information

Type number	Package		
	Name	Description	Version
SSL1623PH	DIP16	plastic dual in-line package; 16 leads (300 mil); long body	SOT38-1

6. Block diagram

7. Pinning information

7.1 Pinning

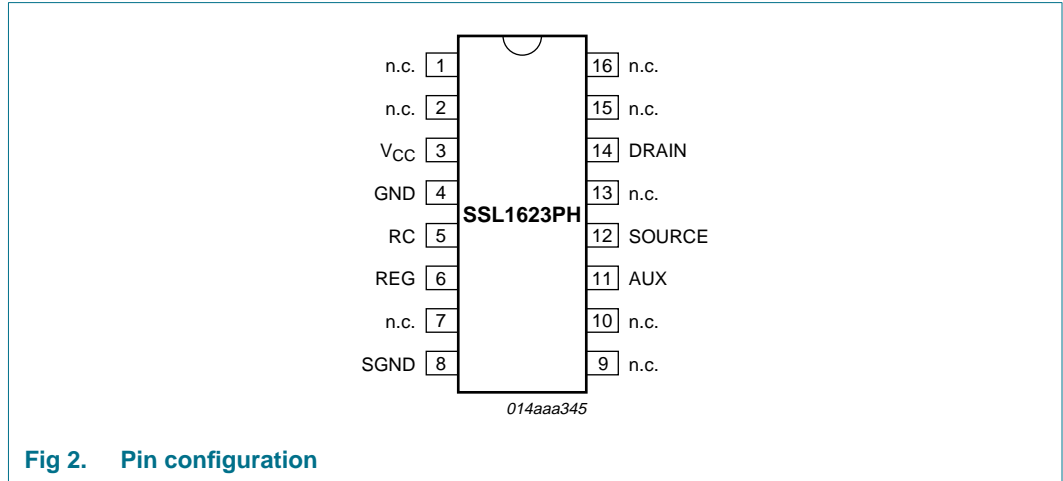

Fig 2. Pin configuration

7.2 Pin description

Table 3. Pin description

Symbol	Pin	Description
V _{CC}	3	supply voltage
GND	4	ground
RC	5	frequency setting
REG	6	regulation input
SGND	8	signal ground; must preferably be connected to pin GND
AUX	11	input for voltage from auxiliary winding for timing (demagnetization)
SOURCE	12	source of internal MOS switch
n.c.	1, 2, 7, 9, 10, 13, 15, 16.	not connected
DRAIN	14	drain of internal MOS switch; input for start-up current and valley sensing

8. Functional description

The SSL1623PH is the heart of a compact flyback converter, with the IC placed at the primary side. The auxiliary winding of the transformer can be used for indirect feedback to control the isolated output. This additional winding also powers the IC. A more accurate control of the output voltage and/or current can be implemented with an additional secondary sensing circuit and opto coupler feedback. The SSL1623PH can be used in a constant power mode or in a constant current mode to drive LEDs.

The SSL1623PH uses voltage mode control. The frequency is determined by the maximum transformer demagnetizing time and the time of the oscillator. In the first case, the converter operates in the Self Oscillating Power Supply (SOPS) mode. In the latter

case, it operates at a constant frequency, which can be adjusted with external components R_{RC} and C_{RC} . Furthermore, a primary stroke is started only in a valley of the secondary ringing. This valley switching principle minimizes capacitive switch-on losses.

8.1 Start-up and undervoltage lockout

Initially, the IC is self-supplying from the rectified mains voltage. The IC starts switching as soon as the voltage on pin V_{CC} passes the $V_{CC(\text{startup})}$ level. The supply is taken over by the auxiliary winding of the transformer as soon as V_{CC} is high enough and the supply from the line is stopped for high efficiency operation.

As soon as the voltage on pin V_{CC} drops below the $V_{CC(\text{stop})}$ level, the IC stops switching and restarts from the rectified mains voltage.

8.2 Oscillator

The frequency of the oscillator is set by the external resistor and capacitor on pin RC. The external capacitor is charged rapidly to the $V_{RC(\text{max})}$ level and, starting from a new primary stroke, it discharges to the $V_{RC(\text{min})}$ level. Because the discharge is exponential, the relative sensitivity of the duty factor to the regulation voltage at low duty factor is almost equal to the sensitivity at high duty factors. This results in a more constant gain over the duty factor range compared to systems with a linear sawtooth oscillator. Stable operation at low duty factors is easily realized. For high efficiency, the frequency is reduced as soon as the duty factor drops below a certain value. This is accomplished by increasing the oscillator charge time.

To ensure that the capacitor can be charged within the charge time, the value of the oscillator capacitor should be limited to approximately 1 nF.

8.3 Duty factor control

The duty factor is controlled by the internal regulation voltage and the oscillator signal on pin RC. The internal regulation voltage is equal to the external regulation voltage (minus 2.5 V) multiplied by the gain of the error amplifier (typical 20 dB).

The minimum duty factor of the switched mode power supply is 0 %. The maximum duty factor is set to 75 % (typical value at 100 kHz oscillation frequency).

8.4 Valley switching

A new cycle is started at the primary stroke when the switch is switched on (see [Figure 3](#)). After a certain time (determined by the RC oscillator voltage and the internal regulation level), the switch is turned off and the secondary stroke starts. The internal regulation level is determined by the voltage on pin REG. After the secondary stroke, the DRAIN voltage shows an oscillation with a frequency of approximately, see [Equation 1](#).

$$\frac{1}{2\pi \times \sqrt{L_p C_p}} \quad (1)$$

Where:

L_p is the primary self-inductance on the drain node.

C_p is the parasitic capacitance on the drain node.

As soon as the oscillator voltage is high again and the secondary stroke has ended, the circuit waits for a low drain voltage before starting a new primary stroke.

The primary stroke starts some time before the actual valley at low ringing frequencies, and some time after the actual valley at high ringing frequencies. [Figure 4](#) shows a typical curve for a reflected voltage $N \times V_o$ of 80 V. This voltage is the output voltage V_o (see [Figure 5](#)) transferred to the primary side of the transformer with the factor N (determined by the turns ratio of the transformer). [Figure 4](#) shows that the system switches exactly at minimum drain voltage for ringing frequencies of 480 kHz, thus reducing the switch-on losses to a minimum. At 200 kHz, the next primary stroke is started at 33° before the valley. The switch-on losses are still reduced significantly.

8.5 Demagnetization

The system operates in discontinuous conduction mode all the time. As long as the secondary stroke has not ended, the oscillator will not start a new primary stroke. During the suppression time $t_{sup(xfmr_ring)}$, demagnetization recognition is suppressed. This suppression may be necessary in applications where the transformer has a large leakage inductance and at low output voltages.

8.6 Protections

8.6.1 Overcurrent protection

The cycle-by-cycle peak drain current limit circuit uses the external source resistor R_l (see [Figure 5](#)) to measure the current. The circuit is activated after the leading edge blanking time t_{leb} . The protection circuit limits the source voltage to $V_{SOURCE(max)}$ and thus limits the primary peak current.

8.6.2 Short winding protection

The short winding protection circuit is also activated after the leading edge blanking time. If the source voltage exceeds the short winding protection voltage V_{swp} , the SSL1623PH stops switching. Only a power-on reset will restart normal operation. The short winding protection also protects in case of a secondary diode short circuit.

8.6.3 Overtemperature protection

An accurate temperature protection is provided in the SSL1623PH. When the junction temperature exceeds the thermal shutdown temperature, the IC stops switching. During thermal protection the IC current is lowered to the start-up current. The IC continues normal operation as soon as the overtemperature situation has disappeared.

8.6.4 Overvoltage protection

Overvoltage protection can be achieved in the application by pulling pin REG above its normal operation level or by keeping the level of pin AUX above $V_{det(demag)}$. The current primary stroke is terminated immediately and no new primary stroke is started until the voltage on pin REG drops to its normal operation level. Pin REG has an internal clamp. The current feed into pin REG must be limited.

8.7 Characteristics of the complete LED power supply

8.7.1 Input

The input voltage range comprises the universal AC mains from 80 V to 276 V.

8.7.2 Accuracy

The accuracy of the complete converter, functioning as a voltage source with primary sensing, is approximately 8 % (mainly dependent on the transformer coupling). The accuracy with secondary sensing is defined by the accuracy of the external components. For safety requirements in case of opto coupler feedback loss, the primary sensing remains active when an overvoltage circuit is connected.

8.7.3 Efficiency

An efficiency of over 80 % at maximum output power can be achieved for a complete converter designed for universal mains.

8.7.4 Ripple

A minimum ripple is obtained in a system designed for a maximum duty factor of 50 % under normal operating conditions and a minimized dead time. The magnitude of the ripple in the output voltage is determined by the frequency and duty factor of the converter, the output current level, and the value and ESR of the output capacitor.

9. Limiting values

Table 4. Limiting values

In accordance with the Absolute Maximum Rating System (IEC 60134).

Symbol	Parameter	Conditions	Min	Max	Unit
Voltages					
V_{CC}	supply voltage	continuous	[1] -0.4	+40	V
V_{RC}	voltage on pin RC		[1] -0.4	+3	V
V_{SOURCE}	voltage on pin source		-0.4	+5	V
V_{DRAIN}	voltage on pin DRAIN		-0.4	+650	V
Currents					
I_{REG}	current on pin REG		[2] -	6	mA
I_{AUX}	current on pin AUX		[2] -10	+5	mA
I_{ch}	charge current	oscillator capacitor	-3	-	mA
I_{source}	source current		-2	+2	A
I_{DRAIN}	current on pin DRAIN		-2	+2	A

Table 4. Limiting values ...continued
In accordance with the Absolute Maximum Rating System (IEC 60134).

Symbol	Parameter	Conditions	Min	Max	Unit
General					
P_{tot}	total power dissipation	$T_{amb} < 50\text{ °C}$	-	1.7	W
T_{stg}	storage temperature		-55	+150	°C
T_{amb}	ambient temperature		-20	+85	°C
T_j	junction temperature		-20	+145	°C
V_{esd}	electrostatic discharge voltage	human body model [3]			
		pin DRAIN	-1500	+1500	V
		all other pins	-2000	+2000	V
		machine model [4]			
	all pins		-200	+200	V

- [1] Pins V_{CC} and RC are not allowed to be current driven.
- [2] Pins REG and AUX are not allowed to be voltage driven.
- [3] Human body model: equivalent to discharging a 100 pF capacitor through a 1.5 kΩ series resistor.
- [4] Machine model: equivalent to discharging a 200 pF capacitor through a 0.75 μH coil and a 10 Ω series resistor.

10. Thermal characteristics

Table 5. Thermal characteristics

Symbol	Parameter	Conditions	Typ	Unit
$R_{th(j-a)}$	thermal resistance from junction to ambient	in free air	[1] 55	K/W

- [1] Thermal resistance $R_{th(j-a)}$ can be lower when pin GND is connected to sufficient copper area on the printed-circuit board.

11. Characteristics

Table 6. Characteristics

Measurement valid data $T_{amb} = 25\text{ °C}$; no overtemperature; all voltages are measured with respect to ground; currents are positive when flowing into the IC; unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
Supplies						
Supply on pin V_{CC}						
$V_{CC(startup)}$	start-up supply voltage		9	9.5	10	V
$V_{CC(stop)}$	stop supply voltage	undervoltage lockout	7.0	7.5	8.0	V
$I_{CC(oper)}$	operating supply current	normal operation	-	1.3	1.9	mA
$I_{CC(startup)}$	start-up supply current	start-up	-	180	400	μA
I_{ch}	charge current	$V_{DRAIN} > 60\text{ V}$				
		$V_{CC} = 0\text{ V}$	-650	-520	-390	μA
		$V_{CC} = 8.5\text{ V}$	-375	-275	-175	μA

Table 6. Characteristics ...continued

Measurement valid data $T_{amb} = 25\text{ °C}$; no overtemperature; all voltages are measured with respect to ground; currents are positive when flowing into the IC; unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
Supply on pin DRAIN						
I_{DRAIN}	current on pin DRAIN	no auxiliary supply	-	0.5	-	mA
		with auxiliary supply; $V_{DRAIN} > 60\text{ V}$	-	30	125	μA
Pulse width modulator mode						
δ_{min}	minimum duty factor		-	0	-	%
δ_{max}	maximum duty cycle	$f_{osc} = 100\text{ kHz}$	-	75	-	%
Self oscillating power supply mode						
$V_{det(demag)}$	demagnetization detection voltage		50	100	150	mV
$t_{sup(xfmr_ring)}$	transformer ringing suppression time		1.0	1.5	2.0	μs
Oscillator: pin RC						
$V_{RC(min)}$	minimum voltage on pin RC		60	75	90	mV
$V_{RC(max)}$	maximum voltage on pin RC		2.4	2.5	2.6	V
t_{ch}	charging time		-	1	-	μs
f_{osc}	oscillator frequency		10	-	200	kHz
Duty factor regulator: pin REG						
V_{REG}	voltage on pin REG		2.4	2.5	2.6	V
G_v	voltage gain		-	20	-	dB
$V_{clamp(REG)}$	clamp voltage on pin REG	$I_{REG} = 6\text{ mA}$	-	-	7.5	V
Valley switching recognition						
$(\Delta V/\Delta t)_{vrec}$	valley recognition voltage change with time		-102	-	+102	V/ μs
f_{ring}	ringing frequency	$N \times V_o = 100\text{ V}$	200	550	800	kHz
$t_{d(vrec-swon)}$	valley recognition to switch-on delay time		-	150	-	ns
Output stage (FET)						
$I_{L(DRAIN)}$	leakage current on pin DRAIN	$V_{DRAIN} = 650\text{ V}$	-	-	125	μA
$V_{BR(DRAIN)}$	breakdown voltage on pin DRAIN	$T_j > 0\text{ °C}$	650	-	-	V
R_{DSon}	drain-source on-state resistance	$I_{source} = -0.5\text{ A}$				
		$T_j = 25\text{ °C}$	-	6.5	7.5	Ω
		$T_j = 100\text{ °C}$	-	9.0	10.0	Ω
$t_f(DRAIN)$	fall time on pin DRAIN	$V_{DRAIN} = 300\text{ V}$; no external capacitor at pin DRAIN	-	75	-	ns
Temperature protection						
T_{prot}	protection temperature		150	160	170	$^{\circ}\text{C}$
$T_{prot(hys)}$	hysteresis of protection temperature		-	2	-	$^{\circ}\text{C}$
Overcurrent and short winding protection: pin SOURCE						
$V_{SOURCE(max)}$	maximum voltage on pin SOURCE	$\Delta V/\Delta t = 0.1\text{ V}/\mu\text{s}$	0.47	0.50	0.53	V

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

15.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

15.3 Disclaimers

General — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in medical, military, aircraft, space or life support equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental

damage. NXP Semiconductors accepts no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Quick reference data — The Quick reference data is an extract of the product data given in the Limiting values and Characteristics sections of this document, and as such is not complete, exhaustive or legally binding.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) may cause permanent damage to the device. Limiting values are stress ratings only and operation of the device at these or any other conditions above those given in the Characteristics sections of this document is not implied. Exposure to limiting values for extended periods may affect device reliability.

Terms and conditions of sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, including those pertaining to warranty, intellectual property rights infringement and limitation of liability, unless explicitly otherwise agreed to in writing by NXP Semiconductors. In case of any inconsistency or conflict between information in this document and such terms and conditions, the latter will prevail.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.
