

General Description

The MIC918 is a high-speed operational amplifier with a gain-bandwidth product of 51MHz. The part is unity gain stable. It has a very low 550A supply current, and features the IttyBitty™ SOT-23-5 package and SC-70 package. Supply voltage range is from $\pm 2.5V$ to $\pm 9V$, allowing the MIC918 to be used in low-voltage circuits or applications requiring large dynamic range.

The MIC918 is stable driving any capacitive load and achieves excellent PSRR and CMRR, making it much easier to use than most conventional high-speed devices. Low supply voltage, low power consumption, and small packing make the MIC918 ideal for portable equipment. The ability to drive capacitive loads also makes it possible to drive long coaxial cables.

Features

- 51MHz gain bandwidth product
- 550 μA supply current
- SOT-23-5 or SC-70 packages
- 1500V/ μs slew rate
- drives any capacitive load
- Unity gain stable

Applications

- Video
- Imaging
- Ultrasound
- Portable equipment
- Line drivers

Ordering Information

Part Number	Junction Temp. Range	Package
MIC918BM5	-40°C to +85°C	SOT-23-5*
MIC918BC5	-40°C to +85°C	SC-70

* Contact factory about SOT-23-5 package.

Pin Configuration

SOT-23-5 or SC-70

Functional Pinout

SOT-23-5 or SC-70

Pin Description

Pin Number	Pin Name	Pin Function
1	IN+	Noninverting Input
2	V-	Negative Supply (Input)
3	IN-	Inverting Input
4	OUT	Output: Amplifier Output
5	V+	Positive Supply (Input)

Absolute Maximum Ratings (Note 1)

Supply Voltage ($V_{V+} - V_{V-}$)	20V
Differential Input Voltage ($ V_{IN+} - V_{IN-} $)	4V, Note 3
Input Common-Mode Range (V_{IN+}, V_{IN-})	V_{V+} to V_{V-}
Lead Temperature (soldering, 5 sec.)	260°C
Storage Temperature (T_S)	150°C
ESD Rating, Note 4	1.5kV

Operating Ratings (Note 2)

Supply Voltage (V_S)	$\pm 2.5V$ to $\pm 9V$
Junction Temperature (T_J)	$-40^\circ C$ to $+85^\circ C$
Package Thermal Resistance	
SOT-23-5	260°C/W
SC-70-5	450°C/W

Electrical Characteristics ($\pm 5V$)

$V_+ = +5V$, $V_- = -5V$, $V_{CM} = 0V$, $R_L = 10M\Omega$; $T_J = 25^\circ C$, **bold** values indicate $-40^\circ C \leq T_J \leq +85^\circ C$; unless noted.

Symbol	Parameter	Condition	Min	Typ	Max	Units
V_{OS}	Input Offset Voltage			0.43	5	mV
V_{OS}	V_{OS} Temperature Coefficient			1		$\mu V/^\circ C$
I_B	Input Bias Current			0.26	0.6	μA
I_{OS}	Input Offset Current			0.04	0.3	μA
V_{CM}	Input Common-Mode Range	CMRR > 72dB	-3.25		+3.25	V
CMRR	Common-Mode Rejection Ratio	$-2.5V < V_{CM} < +2.5V$	75	85		dB
PSRR	Power Supply Rejection Ratio	$\pm 3.5V < V_S < \pm 9V$	95	104		dB
A_{VOL}	Large-Signal Voltage Gain	$R_L = 2k, V_{OUT} = \pm 2V$	65	82		dB
		$R_L = 100\Omega, V_{OUT} = \pm 1V$		85		dB
V_{OUT}	Maximum Output Voltage Swing	positive, $R_L = 2k\Omega$	+3.0	3.6		V
		negative, $R_L = 2k\Omega$		-3.6	-3.0	V
		positive, $R_L = 200\Omega$	+1.5	3.0		V
		negative, $R_L = 200\Omega$, Note 5		-2.5	-1.0	V
GBW	Unity Gain-Bandwidth Product			45		MHz
PM	Phase Margin			54		$^\circ$
BW	-3dB Bandwidth			95		MHz
SR	Slew Rate	$C = 1.7pF$, Gain=1, $V_{OUT} = 5V$, peak to peak, positive SR = 450V/ μs		850		V/ μs
I_{SC}	Short-Circuit Output Current	source	45	63		mA
		sink	20	45		mA
I_S	Supply Current	No Load		0.55	0.80	mA
	Input Voltage Noise	$f = 10kHz$		10		nV/\sqrt{Hz}
	Input Current Noise	$f = 10kHz$		0.8		pA/\sqrt{Hz}

Electrical Characteristics

	Input Current Noise	$f = 10kHz$		0.8		pA/ \sqrt{Hz}

Note 1. Exceeding the absolute maximum rating may damage the device.

Note 2. The device is not guaranteed to function outside its operating rating.

Note 3. Exceeding the maximum differential input voltage will damage the input stage and degrade performance (in particular, input bias current is likely to change).

Note 4. Devices are ESD sensitive. Handling precautions recommended. Human body model, 1.5k in series with 100pF.

Note 5. Output swing limited by the maximum output sink capability, refer to the short-circuit current vs. temperature graph in "Typical Characteristics."

Typical Characteristics

Applications Information

The MIC918 is a high-speed, voltage-feedback operational amplifier featuring very low supply current and excellent stability. This device is unity gain stable, capable of driving high capacitance loads.

Driving High Capacitance

The MIC918 is stable when driving high capacitance, making it ideal for driving long coaxial cables or other high-capacitance loads.

Phase margin remains constant as load capacitance is increased. Most high-speed op amps are only able to drive limited capacitance.

Note: increasing load capacitance does reduce the speed of the device. In applications where the load capacitance reduces the speed of the op amp to an unacceptable level, the effect of the load capacitance can be reduced by adding a small resistor (<100Ω) in series with the output.

Feedback Resistor Selection

Conventional op amp gain configurations and resistor selection apply, the MIC918 is NOT a current feedback device.

Also, for minimum peaking, the feedback resistor should have low parasitic capacitance, usually 470Ω is ideal. To use the part as a follower, the output should be connected to input via a short wire.

Layout Considerations

All high speed devices require careful PCB layout. The following guidelines should be observed: Capacitance, particularly on the two inputs pins will degrade performance; avoid large copper traces to the inputs. Keep the output signal away from the inputs and use a ground plane.

It is important to ensure adequate supply bypassing capacitors are located close to the device.

Power Supply Bypassing

Regular supply bypassing techniques are recommended. A 10μF capacitor in parallel with a 0.1μF capacitor on both the positive and negative supplies are ideal. For best performance all bypassing capacitors should be located as close to the op amp as possible and all capacitors should be low ESL (equivalent series inductance), ESR (equivalent series resistance). Surface-mount ceramic capacitors are ideal.

Thermal Considerations

The SOT-23-5 package and the SC-70 package, like all small packages, has a high thermal resistance. It is important to ensure the IC does not exceed the maximum operating junction (die) temperature of 85°C. The part can be operated up to the absolute maximum temperature rating of 125°C, but between 85°C and 125°C performance will degrade, in particular CMRR will reduce.

An MIC918 with no load, dissipates power equal to the quiescent supply current × supply voltage

$$P_{D(no\ load)} = (V_{V+} - V_{V-}) I_S$$

When a load is added, the additional power is dissipated in the output stage of the op amp. The power dissipated in the device is a function of supply voltage, output voltage and output current.

$$P_{D(output\ stage)} = (V_{V+} - V_{OUT}) I_{OUT}$$

$$Total\ Power\ Dissipation = P_{D(no\ load)} + P_{D(output\ stage)}$$

Ensure the total power dissipated in the device is no greater than the thermal capacity of the package. The SOT23-5 package has a thermal resistance of 260C/W.

$$Max.\ Allowable\ Power\ Dissipation = \frac{T_{J(max)} - T_{A(max)}}{260W}$$
