## 3 MHz, 600 mA Step-Down DC-DC Converter

### High-Efficiency, Low Ripple, Adjustable Output Voltage

The NCV8925 DC-DC buck converter is available in a space saving low profile TSOP-5 and  $\mu$ UDFN6 package. The part can supply output voltages from 0.9 V to 3.3 V by an external resistor divider and is able to deliver output currents up to 600 mA. This switching regulator operates at 3.0 MHz and automatically switches between PFM and PWM modes to improve system efficiency.

Soft-start, cycle-by-cycle current limiting and thermal shutdown protection are also integrated in NCV8925.

The device is optimized for automotive applications and bring a high frequency DC-DC solution for automotive requirements.

#### Features

- Up to 93% Efficiency
- Allow Use of Small External Components
- Source up to 600 mA
- 3 MHz Switching Frequency
- Adjustable Output Voltage from 0.9 V to 3.3 V
- Synchronous Rectification for Higher Efficiency
- 2.7 V to 5.5 V Input Voltage Range
- Low Quiescent Current
- Shutdown Current Consumption of 0.3  $\mu$ A
- Thermal Limit Protection
- Short Circuit Protection
- All Pins are Fully ESD Protected
- These are Pb-Free Devices
- NCV Prefix for Automotive and Other Applications Requiring Site and Control Changes

## PIN FUNCTION DESCRIPTION

Pin TSOP-5	Pin UDFN6	Pin Name	Type	Description
1	3	VIN	Analog / Power Input	Power supply input for the PFET power stage, analog and digital blocks. The pin must be decoupled to ground by a 10 μF ceramic capacitor.
2	2, 4	GND	Analog / Power Ground	This pin is the GND reference for the NFET power stage and the analog section of the IC. The pin must be connected to the system ground.
3	1	EN	Digital Input	Enable for switching regulators. This pin is active HIGH and is turned off by logic LOW on this pin.
4	6	FB	Analog Input	Feedback voltage from the output of the power supply. This is the input to the error amplifier.
5	5	LX	Analog Output	Connection from power MOSFETs to the Inductor.

## PIN CONNECTIONS

**MAXIMUM RATINGS**

Rating	Symbol	Value	Unit
Minimum Voltage All Pins	$V_{min}$	-0.3	V
Maximum Voltage All Pins (Note 2)	$V_{max}$	7.0	V
Maximum Voltage EN, FB, LX	$V_{max}$	$V_{IN} + 0.3$	V
Thermal Resistance, Junction-to-Air (with Recommended Soldering Footprint)	$R_{\theta JA}$	300 220	$^{\circ}C/W$
	TSOP-5 UDFN6		
Operating Ambient Temperature Range (Notes 6 and 7)	$T_A$	-40 to 125	$^{\circ}C$
Storage Temperature Range	$T_{stg}$	-55 to 150	$^{\circ}C$
Junction Operating Temperature (Notes 6 and 7)	$T_j$	-40 to 150	$^{\circ}C$
Latchup Current Maximum Rating ( $T_A = 85^{\circ}C$ ) (Note 4) Other Pins	$I_{Lu}$	$\pm 100$	mA
ESD Withstand Voltage (Note 3)	$V_{esd}$	2.0 200	kV V
Human Body Model			
Machine Model			
Moisture Sensitivity Level (Note 5)	MSL	1	per IPC

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

- Maximum electrical ratings are defined as those values beyond which damage to the device may occur at  $T_A = 25^{\circ}C$ .
- According to JEDEC standard JESD22-A108B.
- This device series contains ESD protection and exceeds the following tests:  
Human Body Model (HBM) per JEDEC standard: JESD22-A114.  
Machine Model (MM) per JEDEC standard: JESD22-A115.
- Latchup current maximum rating per JEDEC standard: JESD78.
- JEDEC Standard: J-STD-020A.
- In applications with high power dissipation (low  $V_{IN}$ , high  $I_{OUT}$ ), special care must be paid to thermal dissipation issues. Board design considerations – thermal dissipation vias, traces or planes and PCB material – can significantly improve junction to air thermal resistance  $R_{\theta JA}$  (for more information, see design and layout consideration section). Environmental conditions such as ambient temperature  $T_a$  brings thermal limitation on maximum power dissipation allowed.  
The following formula gives calculation of maximum ambient temperature allowed by the application:  
 $T_{a MAX} = T_{j MAX} - (R_{\theta JA} \times P_d)$   
Where  $T_j$  is the junction temperature,  
 $P_d$  is the maximum power dissipated by the device (worst case of the application),  
and  $R_{\theta JA}$  is the junction-to-ambient thermal resistance.
- To prevent permanent thermal damages, this device include a thermal shutdown which engages at  $180^{\circ}C$  (typ).

DC/DC OPERATION DESCRIPTION

Detailed Description

The NCV8925 uses a constant frequency, voltage mode step-down architecture. Both the main (P-Channel MOSFET) and synchronous (N-Channel MOSFET) switches are internal.

The output voltage is set by an external resistor divider in the range of 0.9 V to 3.3 V and can source at least 600 mA.

The NCV8925 works with two modes of operation; PWM/PFM depending on the current required. In PWM mode, the device can supply voltage with a tolerance of  $\pm 3\%$  and 90% efficiency or better. Lighter load currents cause the device to automatically switch into PFM mode to reduce current consumption and extended battery life.

Additional features include soft-start, undervoltage protection, current overload protection, and thermal shutdown protection. As shown in Figure 2, only six external components are required. The part uses an internal reference voltage of 0.6 V. It is recommended to keep NCV8925 in shutdown mode until the input voltage is 2.7 V or higher.

PWM Operating Mode

In this mode, the output voltage of the device is regulated by modulating the on-time pulse width of the main switch Q1 at a fixed 3 MHz frequency.

The switching of the PMOS Q1 is controlled by a flip-flop driven by the internal oscillator and a comparator that compares the error signal from an error amplifier with the sum of the sensed current signal and compensation ramp.

At the beginning of each cycle, the main switch Q1 is turned ON by the rising edge of the internal oscillator clock. The inductor current ramps up until the sum of the current sense signal and compensation ramp becomes higher than the error amplifier's voltage. Once this has occurred, the PWM comparator resets the flip-flop, Q1 is turned OFF while the synchronous switch Q2 is turned ON. Q2 replaces the external Schottky diode to reduce the conduction loss and improve the efficiency. To avoid overall power loss, a certain amount of dead time is introduced to ensure Q1 is completely turned OFF before Q2 is being turned ON.

Figure 26. PWM Switching Waveform  
 $(V_{IN} = 3.6 \text{ V}, V_{OUT} = 1.2 \text{ V}, I_{OUT} = 600 \text{ mA})$

PFM Operating Mode

Under light load conditions, the NCV8925 enters in low current PFM mode operation to reduce power consumption. The output regulation is implemented by pulse frequency modulation. If the output voltage drops below the threshold of PFM comparator, a new cycle will be initiated by the PFM comparator to turn on the switch Q1. Q1 remains ON during the minimum on time of the structure while Q2 is in its current source mode. The peak inductor current depends upon the drop between input and output voltage. After a short dead time delay where Q1 is switched OFF, Q2 is turned in its ON state. The negative current detector will detect when the inductor current drops below zero and sends the signal to turn Q2 to current source mode to prevent a too large deregulation of the output voltage. When the output voltage falls below the threshold of the PFM comparator, a new cycle starts immediately.

Figure 27. PFM Switching Waveforms  
 $(V_{IN} = 3.6 \text{ V}, V_{OUT} = 1.2 \text{ V}, I_{OUT} = 0 \text{ mA}, \text{Temp} = 25^\circ\text{C})$

**Soft-Start**

The NCV8925 uses soft-start to limit the inrush current when the device is initially powered up or enabled. Soft-start is implemented by gradually increasing the reference voltage until it reaches the full reference voltage. During startup, a pulsed current source charges the internal soft-start capacitor to provide gradually increasing reference voltage. When the voltage across the capacitor ramps up to the nominal reference voltage, the pulsed current source will be switched off and the reference voltage will switch to the regular reference voltage.

**Cycle-by-Cycle Current Limitation**

From the block diagram, an  $I_{LIM}$  comparator is used to realize cycle-by-cycle current limit protection. The comparator compares the LX pin voltage with the reference voltage, which is biased by a constant current. If the inductor current reaches the limit, the  $I_{LIM}$  comparator detects the LX voltage falling below the reference voltage and releases the signal to turn off the switch Q1. The cycle-by-cycle current limit is set at 1200 mA (nom).

**Low Dropout Operation**

The NCV8925 offers a low input to output voltage difference. The NCV8925 can operate at 100% duty cycle. In this mode the PMOS (Q1) remains completely on.

The minimum input voltage to maintain regulation can be calculated as:

$$V_{IN(min)} = V_{OUT(max)} + (I_{OUT} \times (R_{DS(ON)} + R_{INDUCTOR}))$$

(eq. 1)

- $V_{OUT}$ : Output Voltage (Volts)
- $I_{OUT}$ : Max Output Current
- $R_{DS(ON)}$ : P-Channel Switch  $R_{DS(ON)}$
- $R_{INDUCTOR}$ : Inductor Resistance (DCR)

**Undervoltage Lockout**

The input voltage  $V_{IN}$  must reach 2.4 V (typ) before the NCV8925 enables the DC/DC converter output to begin the start up sequence (see Soft-Start section). The UVLO threshold hysteresis is typically 100 mV.

**Shutdown Mode**

Forcing this pin to a voltage below 0.4 V will shut down the IC. In shutdown mode, the internal reference, oscillator and most of the control circuitries are turned off. Therefore, the typical current consumption will be 0.3  $\mu$ A (typical value). Applying a voltage above 1.2 V to EN pin will enable the device for normal operation. The typical threshold is around 0.7 V. The device will go through soft-start to normal operation.

**Thermal Shutdown**

Internal Thermal Shutdown circuitry is provided to protect the integrated circuit in the event that the maximum junction temperature is exceeded. If the junction temperature exceeds 160°C, the device shuts down. In this mode switch Q1 and Q2 and the control circuits are all turned off. The device restarts in soft-start after the temperature drops below 135°C. This feature is provided to prevent catastrophic failures from accidental device overheating, and it is not intended as a substitute for proper heatsinking.

**Short Circuit Protection**

When the output is shorted to ground, the device limits the inductor current. The duty-cycle is minimum and the consumption on the input line is 300 mA (Typ). When the short circuit condition is removed, the device returns to the normal mode of operation.

APPLICATION INFORMATION

Output Voltage Selection

The output voltage is programmed through an external resistor divider connected from V<sub>OUT</sub> to FB then to GND. For low power consumption and noise immunity, the resistor from FB to GND (R2) should be in the [100 k-600 k] range. If R2 is 200 k given the V<sub>FB</sub> is 0.6 V, the current through the divider will be 3.0 μA.

The formula below gives the value of V<sub>OUT</sub>, given the desired R1 and the R1 value:

$$V_{OUT} = V_{FB} \times \left(1 + \frac{R1}{R2}\right) \quad (\text{eq. 2})$$

- V<sub>OUT</sub>: Output Voltage (Volts)
- V<sub>FB</sub>: Feedback Voltage = 0.6 V
- R1: Feedback Resistor from V<sub>OUT</sub> to FB
- R2: Feedback Resistor from FB to GND

Input Capacitor Selection

In PWM operating mode, the input current is pulsating with a large switching noise. Using an input bypass capacitor can reduce the peak current transients drawn from the input supply source, thereby reducing switching noise significantly. The capacitance needed for the input bypass capacitor depends on the source impedance of the input supply.

The maximum RMS current occurs at 50% duty cycle with maximum output current, which is I<sub>out\_max</sub>/2.

For NCV8925, a low profile ceramic capacitor of 4.7 μF should be used for most of the cases. For effective bypass results, the input capacitor should be placed as close as possible to the V<sub>IN</sub> pin.

Table 1. LIST OF INPUT AUTOMOTIVE CAPACITORS

Murata	GCM31CR71C475	4.7 μF
TDK	C3216X7R1E475MT	4.7 μF

Output L-C Filter Design Considerations

The NCV8925 operates at 3 MHz frequency and uses voltage mode architecture. The correct selection of the output filter ensures good stability and fast transient response.

Due to the nature of the buck converter, the output L-C filter must be selected to work with internal compensation. For NCV8925, the internal compensation is internally fixed and it is optimized for an output filter of L = 2.2 μH and C<sub>OUT</sub> = 4.7 μF.

The corner frequency is given by:

$$f_c = \frac{1}{2\pi\sqrt{L \times C_{OUT}}} = \frac{1}{2\pi\sqrt{2.2 \mu\text{H} \times 4.7 \mu\text{F}}} = 49 \text{ kHz} \quad (\text{eq. 3})$$

The device is intended to operate with inductance value of 2.2 μH.

If the corner frequency is moved, it is recommended to check the loop stability depending on the accepted output ripple voltage and the required output current. Take care to check the loop stability. The phase margin is usually higher than 45°.

Table 2. L-C Filter Example

Inductance (L)	Output Capacitor (C <sub>OUT</sub> )
1.0 μH	10 μF
2.2 μH	4.7 μF

Inductor Selection

The inductor parameters directly related to device performances are saturation current and DC resistance and inductance value. The inductor ripple current (ΔI<sub>L</sub>) decreases with higher inductance:

$$\Delta I_L = \frac{V_{OUT}}{L \times f_{SW}} \left(1 - \frac{V_{OUT}}{V_{IN}}\right) \quad (\text{eq. 4})$$

- ΔI<sub>L</sub>: Peak to Peak Inductor Ripple Current
- L: Inductor Value
- f<sub>SW</sub>: Switching Frequency

The saturation current of the inductor should be rated higher than the maximum load current plus half the ripple current:

$$I_{L(MAX)} = I_{O(MAX)} + \frac{\Delta I_L}{2} \quad (\text{eq. 5})$$

- ΔI<sub>L(MAX)</sub>: Maximum Inductor Current
- ΔI<sub>O(MAX)</sub>: Maximum Output Current

The inductor's resistance will factor into the overall efficiency of the converter. For best performance, the DC resistance should be less than 0.3 Ω for good efficiency.

Table 3. LIST OF AUTOMOTIVE INDUCTORS

Coilcraft	DO3316T-102ML	1.0 μH	11 A
	DO3316T-222ML	2.2 μH	7.8 A
TDK	NLCV32T-1R0M-PF	1.0 μH	1.0 A
	NLCV32T-2R2M-PF	2.2 μH	0.77 A

**Output Capacitor Selection**

Selecting the proper output capacitor is based on the desired output ripple voltage. Ceramic capacitors with low ESR values will have the lowest output ripple voltage and are strongly recommended. The output capacitor requires an X7R dielectric.

The output ripple voltage in PWM mode is given by:

$$\Delta V_{OUT} = \Delta I_L \times \left( \frac{1}{4 \times f_{SW} \times C_{OUT}} + ESR \right) \quad (\text{eq. 6})$$

- $\Delta V_{OUT}$ : Output Voltage Ripple in PWM Mode
- $\Delta I_L$ : Peak to Peak Inductor Ripple Current
- $f_{SW}$ : Switching Frequency
- $C_{OUT}$ : Output Capacitor
- ESR: Output Capacitor Serial Resistor

**Table 4. LIST OF OUTPUT CAPACITORS**

Murata	GCM31CR71C475	4.7 $\mu$ F
	GCM31CR71A106	10 $\mu$ F
TDK	C3216X7R1E475MT	4.7 $\mu$ F
	C3216X7R1C106MT	10 $\mu$ F

**Feed-Forward Capacitor Selection**

The feed-forward capacitor sets the feedback loop response and is critical to obtain good loop stability.

Given that the compensation is internally fixed, an 18 pF or higher ceramic capacitor is needed. Choose a small ceramic capacitor X7R dielectric.

SCILLC reserves the right to make changes without further notice to any products herein. SCILLC makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does SCILLC assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. "Typical" parameters which may be provided in SCILLC data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. SCILLC does not convey any license under its patent rights nor the rights of others. SCILLC products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the SCILLC product could create a situation where personal injury or death may occur. Should Buyer purchase or use SCILLC products for any such unintended or unauthorized application, Buyer shall indemnify and hold SCILLC and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that SCILLC was negligent regarding the design or manufacture of the part. SCILLC is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
