ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; $C = 250 \text{ pF}; R = 1.5 \text{ k}\Omega$	-	2	kV

OVERLOAD PROTECTION LIMITING VALUE

With an adequate protection supply connected, TOPFET can protect itself from two types of overload - overtemperature and short circuit load.

For overload conditions an n-MOS transistor turns on between the input and source to quickly discharge the power MOSFET gate capacitance.

The drain current is limited to reduce dissipation in case of short circuit load. Refer to OVERLOAD CHARACTERISTICS.

SYMBOL	PARAMETER	REQUIRED CONDITION	MIN.	MAX.	UNIT
V_{DS}	Overload protection³ Drain source voltage	protection supply $V_{PS} \geq 4 \text{ V}$	0	35	V

OVERVOLTAGE CLAMPING LIMITING VALUES

At a drain source voltage above 50 V the power MOSFET is actively turned on to clamp overvoltage transients.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
E_{DSM}	Inductive load turn off Non-repetitive clamping energy	$I_{DM} = 25 \text{ A}; V_{DD} \leq 20 \text{ V}$ $T_{mb} = 25^\circ\text{C}$	-	550	mJ
E_{DRM}	Repetitive clamping energy	$T_{mb} \leq 95^\circ\text{C}; f = 250 \text{ Hz}$	-	60	mJ

¹ Prior to the onset of overvoltage clamping. For voltages above this value, safe operation is limited by the overvoltage clamping energy.

² A higher T_J is allowed as an overload condition but at the threshold $T_{J(TO)}$ the over temperature trip operates to protect the switch.

³ All control logic and protection functions are disabled during conduction of the source drain diode. If the protection circuit was previously latched, it would be reset by this condition.
