## 1.0 GENERAL DESCRIPTION

The W83194R-17/-17A is a Clock Synthesizer, which provides all clocks required for high-speed RISC or CISC microprocessor such as Intel PentiumII, Pentium, AMD or Cyrix. Eight different frequencies of CPU, AGP and PCI clocks are externally selectable with smooth transitions. The W83194R-17/-17A provides AGP clocks especially for clone chipset. The highest CPU frequency provided by the W83194R-17 is up to 100MHz, but the one of W83194R-17A is up to 133MHz.

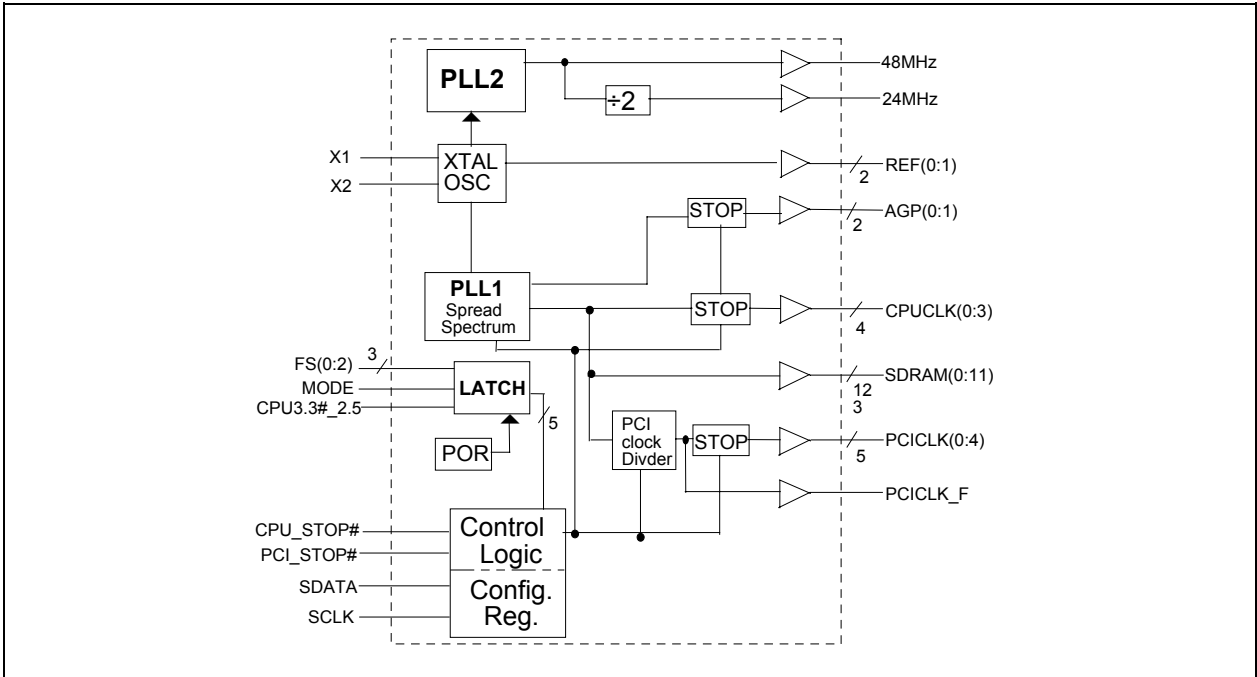

The W83193R-17/-17A provides I<sup>2</sup>C serial bus interface to program the registers to enable or disable each clock outputs and choose the 0.5% or 1.5% center type spread spectrum to reduce EMI.

The W83194R-17/-17A accepts a 14.318 MHz reference crystal as its input and runs on a 3.3V supply. High drive PCI and SDRAM CLOCK outputs typically provide greater than 1 V/ns slew rate into 30 pF loads. CPU CLOCK outputs typically provide better than 1 V/ns slew rate into 20 pF loads as maintaining 50± 5% duty cycle. The fixed frequency outputs as REF, 24MHz, and 48 MHz provide better than 0.5V/ns slew rate.

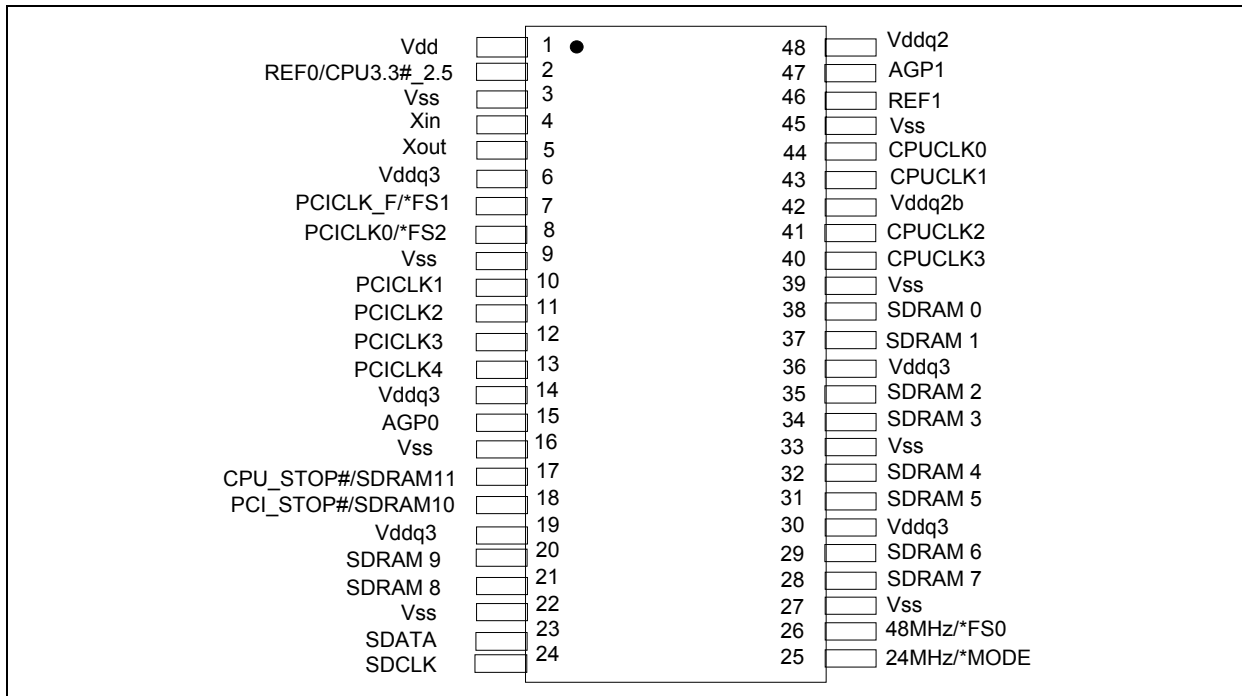

## 2.0 PRODUCT FEATURES

- Supports Pentium™, Pentium™ Pro, Pentium™ II, AMD and Cyrix CPUs with I<sup>2</sup>C.
- 4 CPU clocks
- 12 SDRAM clocks for 3 DIMMs
- Two AGP clocks
- 6 PCI synchronous clocks.
- Optional single or mixed supply:  
(V<sub>dd</sub> = V<sub>ddq3</sub> = V<sub>ddq2</sub> = V<sub>ddq2b</sub> = 3.3V) or (V<sub>dd</sub> = V<sub>ddq2</sub> = V<sub>ddq3</sub> = 3.3V, V<sub>ddq2b</sub> = 2.5V)
- Skew from CPU to PCI clock -1 to 4 ns, center 2.6 ns, AGP to CPU sync. Skew 0 ns (250 ps)
- Smooth frequency switch with selections from 60 MHz to 133 MHz CPU
- I<sup>2</sup>C 2-Wire serial interface and I<sup>2</sup>C read back
- ±0.5% or ±1.5% center type spread spectrum function to reduce EMI
- Programmable registers to enable/stop each output and select modes  
(Mode as Tri-state or Normal)
- MODE pin for power Management
- 48 MHz for USB
- 24 MHz for super I/O
- 48-pin SSOP package

### 5.1 Crystal I/O

SYMBOL	PIN	I/O	FUNCTION
Xin	4	IN	Crystal input with internal loading capacitors and feedback resistors.
Xout	5	OUT	Crystal output at 14.318MHz nominally.

### 5.2 CPU, SDRAM, PCI Clock Outputs

SYMBOL	PIN	I/O	FUNCTION
CPUCLK [0:3]	40,41,43,44	OUT	Low skew (< 250ps) clock outputs for host frequencies such as CPU, Chipset and Cache. Vddq2b is the supply voltage for these outputs.
AGP [0:1]	15,47	OUT	Accelerate Graphic Port clock outputs
SDRAM11/ CPU_STOP#	17	I/O	If MODE = 1 (default), then this pin is a SDRAM Clock buffered output. If MODE = 0, then this pin is CPU_STOP# input used in power management mode for synchronously stopping the all CPU clocks.
SDRAM10/ PCI_STOP#	18	I/O	If MODE = 1 (default), then this pin is a SDRAM clock output. If MODE = 0, then this pin is PCI_STOP # and used in power management mode for synchronously stopping the all PCI clocks.
SDRAM [0:9]	20,21,28,29,31 ,32,34, 35,37,38	O	SDRAM clock outputs which have the same frequency as CPU clocks.
PCICLK_F/ *FS1	7	I/O	Latched input for FS1 at initial power up for H/W selecting the output frequency of CPU, SDRAM and PCI clocks.  Free running PCI clock during normal operation.

### 5.2 CPU, SDRAM, PCI Clock Outputs, continued

SYMBOL	PIN	I/O	FUNCTION
PCICLK 0 / *FS2	8	I/O	Latched input for FS2 at initial power up for H/W selecting the output frequency of CPU, SDRAM and PCI clocks. PCI clock during normal operation.
PCICLK [1:4]	10,11,12,13	OUT	Low skew (< 250ps) PCI clock outputs.

### 5.3 I2C Control Interface

SYMBOL	PIN	I/O	FUNCTION
SDATA	23	I/O	Serial data of I <sup>2</sup> C 2-wire control interface
SDCLK	24	IN	Serial clock of I <sup>2</sup> C 2-wire control interface

### 5.4 Fixed Frequency Outputs

SYMBOL	PIN	I/O	FUNCTION
REF0 / CPU3.3#_2.5	2	I/O	Internal 250kΩ pull-up. Latched input for CPU3.3#_2.5 at initial power up. Reference clock during normal operation. Latched high - Vddq2b = 2.5V Latched low - Vddq2b = 3.3V
REF1	46	I/O	Internal 250kΩ pull-up.
24MHz / *MODE	25	I/O	Internal 250kΩ pull-up. Latched input for MODE at initial power up. 24MHz output for super I/O during normal operation.
48MHz / *FS0	26	I/O	Internal 250kΩ pull-up. Latched input for FS0 at initial power up for H/W selecting the output frequency of CPU, SDRAM and PCI clocks. 48MHz output for USB during normal operation.

### 5.5 Power Pins

SYMBOL	PIN	FUNCTION
Vdd	1	Power supply for REF0 crystal and core logic.
Vddq2	42	Power supply for AGP1, REF1 either 2.5V or 3.3V.
Vddq2b	48	Power supply for CPUCLK [0:3], either 2.5V or 3.3V
Vddq3	6,14,19, 30, 36	Power supply for SDRAM, PCICLK and 48/24MHz outputs.
Vss	3,9,16,22,27, 33,39,45	Circuit Ground.

## 8.0 FUNTION DESCRIPTION

### 8.1 POWER MANAGEMENT FUNCTIONS

All clocks can be individually enabled or disabled via the 2-wire control interface. On power up, external circuitry should allow 3 ms for the VCO to stabilize prior to enabling clock outputs to assure correct pulse widths. When MODE=0, pins 18 and 17 are inputs (PCI\_STOP#), (CPU\_STOP#), when MODE=1, these functions are not available. A particular clock could be enabled as both the 2-wire serial control interface and one of these pins indicate that it should be enabled.

The W83194R-17/-17A may be disabled in the low state according to the following table in order to reduce power consumption. All clocks are stopped in the low state, but maintain a valid high period on transitions from running to stop. The CPU and PCI clocks transform between running and stop by waiting for one positive edge on PCICLK\_F followed by negative edge on the clock of interest, after which high levels of the output are either enabled or disabled.

CPU_STOP#	PCI_STOP#	CPU & AGP	PCI	OTHER CLKs	XTAL & VCOs
0	0	LOW	LOW	RUNNING	RUNNING
0	1	LOW	RUNNING	RUNNING	RUNNING
1	0	RUNNING	LOW	RUNNING	RUNNING
1	1	RUNNING	RUNNING	RUNNING	RUNNING

### 8.2 2-WIRE I<sup>2</sup>C CONTROL INTERFACE

The clock generator is a slave I2C component that can be read back the data stored in the latches for verification. All proceeding bytes must be sent to change one of the control bytes. The 2-wire control interface allows each clock output individually enabled or disabled. On power up, the W83194R-17/-17A initializes with default register settings, and then it optional to use the 2-wire control interface.

The SDATA signal only changes when the SDCLK signal is low, and is stable when SDCLK is high during normal data transfer. There are only two exceptions. One is a high-to-low transition on SDATA while SDCLK is high used to indicate the beginning of a data transfer cycle. The other is a low-to-high transition on SDATA while SDCLK is high used to indicate the end of a data transfer cycle. Data is always sent as complete 8-bit bytes followed by an acknowledge generated.

Byte writing starts with a start condition followed by 7-bit slave address and [1101 0010], command code checking [0000 0000], and byte count checking. After successful reception of each byte, an acknowledge (low) on the SDATA wire will be generated by the clock chip. Controller can start to write to internal I<sup>2</sup>C registers after the string of data. The sequence order is as follows:

Bytes sequence order for I<sup>2</sup>C controller:

Clock Address A(6:0) & R/W	Ack	8 bits dummy Command code	Ack	8 bits dummy Byte count	Ack	Byte0,1,2... until Stop
-------------------------------	-----	------------------------------	-----	----------------------------	-----	----------------------------

Set R/W to 1 when read back the data sequence is as follows:

Clock Address A(6:0) & R/W	Ack	Byte 0	Ack	Byte 1	Ack	Byte2, 3, 4... until Stop
-------------------------------	-----	--------	-----	--------	-----	------------------------------

### 8.3 SERIAL CONTROL REGISTERS

The Pin column lists the affected pin number and the @PowerUp column gives the state at true power up. Registers are set to the values shown only on true power up. "Command Code" byte and "Byte Count" byte must be sent following the acknowledge of the Address Byte. Although the data (bits) in these two bytes are considered "don't care", they must be sent and will be acknowledge. After that, the below described sequence (Register 0, Register 1, Register 2...) will be valid and acknowledged.

## 9.0 SPECIFICATIONS

### 9.1 ABSOLUTE MAXIMUM RATINGS

Stresses greater than those listed in this table may cause permanent damage to the device. Precautions should be taken to avoid application of any voltage higher than the maximum rated voltages to this circuit. Maximum conditions for extended periods may affect reliability. Unused inputs must always be tied to an appropriate logic voltage level (Ground or Vdd).

Symbol	Parameter	Rating
V <sub>dd</sub> , V <sub>IN</sub>	Voltage on any pin with respect to GND	- 0.5 V to + 7.0 V

## 10.0 POWER MANAGEMENT TIMING

### 10.1 CPU\_STOP# Timing Diagram

For synchronous Chipset, CPU\_STOP# pin is a synchronous “ active low ” input pin used to stop the CPU clocks for low power operation. This pin is asserted synchronously by the external control logic at the rising edge of free running PCI clock (PCICLK\_F). All other clocks will continue to run while the CPU clocks are stopped. The CPU clocks will always be stopped in a low state and resume output with full pulse width. In this case, CPU “ locks on latency ” is less than 2 CPU clocks and “ locks off latency ” is less than 2 CPU clocks.

### 10.2 PCI\_STOP# Timing Diagram

For synchronous Chipset, PCI\_STOP# pin is a synchronous “ active low ” input pin used to stop the PCICLK [0:4] for low power operation. This pin is asserted synchronously by the external control logic at the rising edge of free running PCI clock (PCICLK\_F). All other clocks will continue to run while the PCI clocks are stopped. The PCI clocks will always be stopped in a low state and resume output with full pulse width. In this case, PCI “ locks on latency ” is less than 1 PCI clocks and “ locks off latency ” is less than 1 PCI clocks.

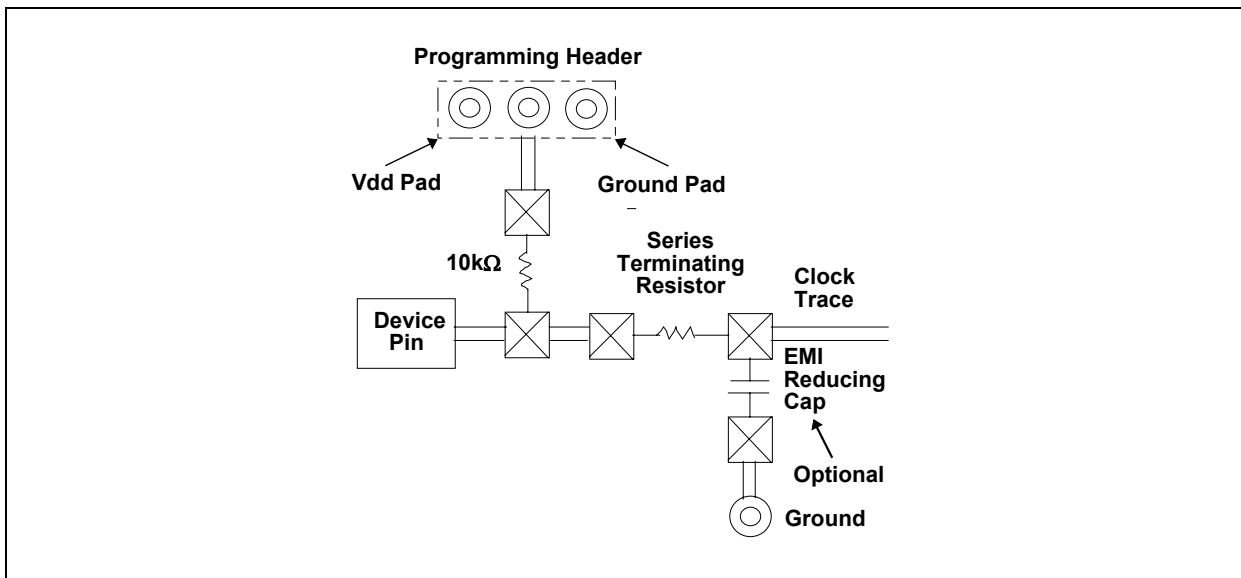

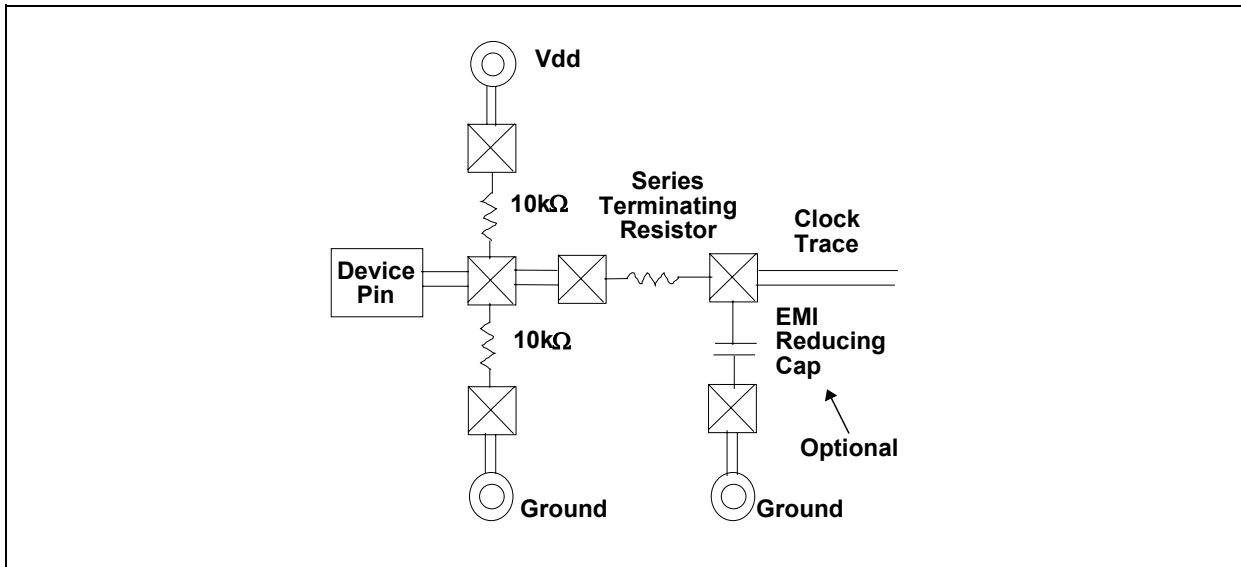

## 11.0 OPERATION OF DUAL FUCTION PINS

Pins 2, 7, 8, 25, and 26 are dual function pins and are used for selecting different functions in this device (see Pin description). During power up, these pins are in input mode (see Fig1), therefore, and are considered input select pins. When Vdd reaches 2.5V, the logic level that is present on these pins are latched into their appropriate internal registers. Once the correct information is properly latched, these pins will change into output pins and will be pulled low by default. At the end of the power up timer (within 3 ms) outputs starts to toggle at the specified frequency.

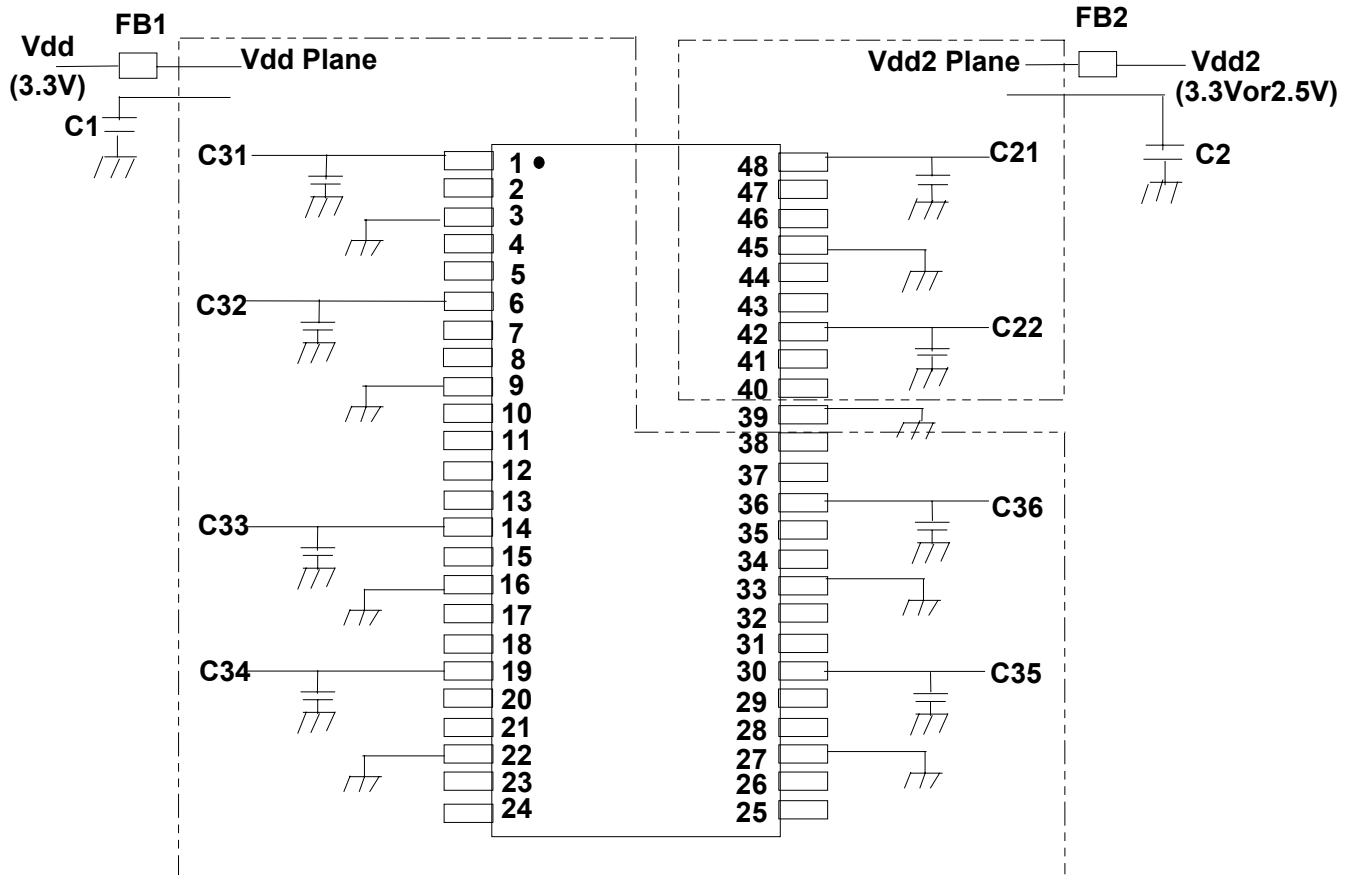

Each of these pins is a large pull-up resistor (250 k $\Omega$  @3.3V) inside. The default state will be logic 1, but the internal pull-up resistor may be too large when long traces or heavy load appear on these dual function pins. Under these conditions, an external 10 k $\Omega$  resistor is recommended to be connected to Vdd if logic 1 is expected. Otherwise, the 10 k $\Omega$  resistor is connected to ground if logic 0 is desired. The 10 k $\Omega$  resistor should be placed before the series terminating resistor. Note that this logic will only be latched at initial power on.

If optional EMI reducing capacitor is needed, they should be placed as close to the series terminating resistor as possible and after the series-terminating resistor. This capacitor has typical values ranging from 4.7pF to 22pF.

## 12.0 POWER SUPPLY SUGGESTION

1. A solid ground plane should be placed around the clock device. Ground connections should be tied to this main ground plane as short as possible. No cuts should be made in the ground plane around the device.
2. C21, C22, C31, C36 are decoupling capacitors (0.1μF surface mount, low ESR, ceramic capacitors.) They should be placed as possible as the Vdd pin and the ground via.
3. C1 and C2 are supplying filtering capacitors for low frequency power supply noise. A 22μF (or 10μF) tantalum capacitor is recommended.
4. Use of Ferrite Bead (FB) is recommended to further reduce the power supply noise.
5. The power supply trace to the Vdd pins must be thick enough so that voltage drops across the trace resistance is negligible.

## 13.0 ORDERING INFORMATION

Part Number	Package Type	Production Flow
W83194R-17/-17A	48 PIN SSOP	Commercial, 0°C to +70°C

## 14.0 HOW TO READ THE TOP MARKING

1st line: Winbond logo and the type number: W83194R-17/-17A

2nd line: Tracking code 2 8051234

2: wafers manufactured in Winbond FAB 2

8051234: wafer production series lot number

3rd line: Tracking code 814 G B B

814: packages made in '98, week 14

G: assembly house ID; A means ASE, S means SPIL, G means GR

BB: IC revision
