## Dual 300MHz Current Feedback Amplifier with Enable

The EL5293 and EL5293A represent dual current feedback amplifiers with a bandwidth of 300 MHz . This makes these amplifiers ideal for today's high speed video and monitor applications.

With a supply current of just 4 mA per amplifier and the ability to run from a single supply voltage from 5 V to 10 V , these amplifiers are also ideal for hand held, portable or battery powered equipment.

The EL5293A also incorporates an enable and disable function to reduce the supply current to $100 \mu \mathrm{~A}$ typical per amplifier. Allowing the $\overline{\mathrm{CE}}$ pin to float or applying a low logic level will enable the amplifier.

The EL5293 is offered in the industry-standard 8-pin SO package and the space-saving 8-pin MSOP package. The EL5293A is available in a 10-pin MSOP package and all operate over the industrial temperature range of $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

NOTE: Intersil Pb-free plus anneal products employ special Pb-free material sets; molding compounds/die attach materials and 100\% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb -free soldering operations. Intersil Pb -free products are MSL classified at Pb -free peak reflow temperatures that meet or exceed the Pb -free requirements of IPC/JEDEC J STD-020.

## Features

- 300MHz -3dB bandwidth
- 4 mA supply current (per amplifier)
- Single and dual supply operation, from 5 V to 10 V
- Fast enable/disable (EL5293A only)
- Single (EL5193) and triple (EL5393) available
- High speed, 1 GHz product available (EL5191)
- High speed, $6 \mathrm{~mA}, 600 \mathrm{MHz}$ product available (EL5192, EL5292, and EL5392)
- Pb-free plus anneal available (RoHS compliant)

## Applications

- Battery-powered equipment
- Hand-held, portable devices
- Video amplifiers
- Cable drivers
- RGB amplifiers
- Test equipment
- Instrumentation
- Current to voltage converters

## Applications Information

## Product Description

The EL5293 is a current-feedback operational amplifier that offers a wide -3 dB bandwidth of 300 MHz and a low supply current of 4 mA per amplifier. The EL5293 works with supply voltages ranging from a single 5 V to 10 V and they are also capable of swinging to within 1 V of either supply on the output. Because of their current-feedback topology, the EL5293 does not have the normal gain-bandwidth product associated with voltage-feedback operational amplifiers. Instead, its -3dB bandwidth to remain relatively constant as closed-loop gain is increased. This combination of high bandwidth and low power, together with aggressive pricing make the EL5293 the ideal choice for many low-power/highbandwidth applications such as portable, handheld, or battery-powered equipment.

For varying bandwidth needs, consider the EL5191 with 1 GHz on a 9 mA supply current or the EL5192 with 600MHz on a 6 mA supply current. Versions include single, dual, and triple amp packages with 5-pin SOT23, 16-pin QSOP, and 8pin or 16-pin SO outlines.

## Power Supply Bypassing and Printed Circuit Board Layout

As with any high frequency device, good printed circuit board layout is necessary for optimum performance. Low impedance ground plane construction is essential. Surface mount components are recommended, but if leaded components are used, lead lengths should be as short as possible. The power supply pins must be well bypassed to reduce the risk of oscillation. The combination of a $4.7 \mu \mathrm{~F}$ tantalum capacitor in parallel with a $0.01 \mu \mathrm{~F}$ capacitor has been shown to work well when placed at each supply pin.

For good AC performance, parasitic capacitance should be kept to a minimum, especially at the inverting input. (See the Capacitance at the Inverting Input section) Even when ground plane construction is used, it should be removed from the area near the inverting input to minimize any stray capacitance at that node. Carbon or Metal-Film resistors are acceptable with the Metal-Film resistors giving slightly less peaking and bandwidth because of additional series inductance. Use of sockets, particularly for the SO package, should be avoided if possible. Sockets add parasitic inductance and capacitance which will result in additional peaking and overshoot.

## Disable/Power-Down

The EL5293A amplifier can be disabled placing its output in a high impedance state. When disabled, the amplifier supply current is reduced to $<300 \mu \mathrm{~A}$. The EL5293A is disabled when its $\overline{\mathrm{CE}}$ pin is pulled up to within 1 V of the positive supply. Similarly, the amplifier is enabled by floating or pulling its $\overline{\mathrm{CE}}$ pin to at least 3 V below the positive supply. For $\pm 5 \mathrm{~V}$ supply, this means that an EL5293A amplifier will be enabled when $\overline{\mathrm{CE}}$ is 2 V or less, and disabled when $\overline{\mathrm{CE}}$ is above 4 V . Although the logic levels are not standard TTL, this choice of logic voltages allows the EL5293A to be enabled by tying $\overline{\mathrm{CE}}$ to ground, even in 5 V single supply applications. The $\overline{C E}$ pin can be driven from CMOS outputs.

## Capacitance at the Inverting Input

Any manufacturer's high-speed voltage- or current-feedback amplifier can be affected by stray capacitance at the inverting input. For inverting gains, this parasitic capacitance has little effect because the inverting input is a virtual ground, but for non-inverting gains, this capacitance (in conjunction with the feedback and gain resistors) creates a pole in the feedback path of the amplifier. This pole, if low enough in frequency, has the same destabilizing effect as a zero in the forward open-loop response. The use of largevalue feedback and gain resistors exacerbates the problem by further lowering the pole frequency (increasing the possibility of oscillation.)

The EL5293 has been optimized with a $475 \Omega$ feedback resistor. With the high bandwidth of these amplifiers, these resistor values might cause stability problems when combined with parasitic capacitance, thus ground plane is not recommended around the inverting input pin of the amplifier.

## Feedback Resistor Values

The EL5293 has been designed and specified at a gain of +2 with $R_{F}$ approximately $500 \Omega$. This value of feedback resistor gives 200 MHz of -3 dB bandwidth at $A_{V}=2$ with 2 dB of peaking. With $A_{V}=-2$, an $R_{F}$ of approximately $500 \Omega$ gives 175 MHz of bandwidth with 0.2 dB of peaking. Since the EL5293 is a current-feedback amplifier, it is also possible to change the value of $R_{F}$ to get more bandwidth. As seen in the curve of Frequency Response for Various $R_{F}$ and $R_{G}$,
bandwidth and peaking can be easily modified by varying the value of the feedback resistor.

Because the EL5293 is a current-feedback amplifier, its gainbandwidth product is not a constant for different closed-loop gains. This feature actually allows the EL5293 to maintain about the same -3dB bandwidth. As gain is increased, bandwidth decreases slightly while stability increases. Since the loop stability is improving with higher closed-loop gains, it becomes possible to reduce the value of $R_{F}$ below the specified $475 \Omega$ and still retain stability, resulting in only a slight loss of bandwidth with increased closed-loop gain.

## Supply Voltage Range and Single-Supply Operation

The EL5293 has been designed to operate with supply voltages having a span of greater than 5 V and less than 10 V . In practical terms, this means that the EL5293 will operate on dual supplies ranging from $\pm 2.5 \mathrm{~V}$ to $\pm 5 \mathrm{~V}$. With singlesupply, the EL5293 will operate from 5V to 10V.

As supply voltages continue to decrease, it becomes necessary to provide input and output voltage ranges that can get as close as possible to the supply voltages. The EL5293 has an input range which extends to within 2 V of either supply. So, for example, on +5 V supplies, the EL5293 has an input range which spans $\pm 3 \mathrm{~V}$. The output range of the EL5293 is also quite large, extending to within 1 V of the supply rail. On a $\pm 5 \mathrm{~V}$ supply, the output is therefore capable of swinging from -4 V to +4 V . Single-supply output range is larger because of the increased negative swing due to the external pull-down resistor to ground.

## Video Performance

For good video performance, an amplifier is required to maintain the same output impedance and the same frequency response as DC levels are changed at the output. This is especially difficult when driving a standard video load of $150 \Omega$, because of the change in output current with DC level. Previously, good differential gain could only be achieved by running high idle currents through the output transistors (to reduce variations in output impedance.) These currents were typically comparable to the entire 4 mA supply current of each EL5293 amplifier. Special circuitry has been incorporated in the EL5293 to reduce the variation of output impedance with current output. This results in dG and dP specifications of $0.03 \%$ and $0.04^{\circ}$, whil e driving $150 \Omega$ at a gain of 2.
Video performance has also been measured with a $500 \Omega$ load at a gain of +1 . Under these conditions, the EL5293 has dG and dP specifications of $0.03 \%$ and $0.04^{\circ}$.

## Output Drive Capability

In spite of its low 4mA of supply current, the EL5293 is capable of providing a minimum of $\pm 95 \mathrm{~mA}$ of output current. With a minimum of $\pm 95 \mathrm{~mA}$ of output drive, the EL5293 is capable of driving $50 \Omega$ loads to both rails, making it an
excellent choice for driving isolation transformers in telecommunications applications.

## Driving Cables and Capacitive Loads

When used as a cable driver, double termination is always recommended for reflection-free performance. For those applications, the back-termination series resistor will decouple the EL5293 from the cable and allow extensive capacitive drive. However, other applications may have high capacitive loads without a back-termination resistor. In these applications, a small series resistor (usually between $5 \Omega$ and $50 \Omega$ ) can be placed in series with the output to eliminate most peaking. The gain resistor $\left(\mathrm{R}_{\mathrm{G}}\right)$ can then be chosen to make up for any gain loss which may be created by this additional resistor at the output. In many cases it is also possible to simply increase the value of the feedback resistor $\left(R_{F}\right)$ to reduce the peaking.

## Current Limiting

The EL5293 has no internal current-limiting circuitry. If the output is shorted, it is possible to exceed the Absolute Maximum Rating for output current or power dissipation, potentially resulting in the destruction of the device.

## Power Dissipation

With the high output drive capability of the EL5293, it is possible to exceed the $125^{\circ} \mathrm{C}$ Absolute Maximum junction temperature under certain very high load current conditions. Generally speaking when $R_{L}$ falls below about $25 \Omega$, it is important to calculate the maximum junction temperature (TJMAX) for the application to determine if power supply voltages, load conditions, or package type need to be modified for the EL5293 to remain in the safe operating area. These parameters are calculated as follows:

$$
T_{\mathrm{JMAX}}=\mathrm{T}_{\mathrm{MAX}}+\left(\theta_{\mathrm{JA}} \times \mathrm{n} \times \mathrm{PD}_{\mathrm{MAX}}\right)
$$

where:
$\mathrm{T}_{\text {MAX }}=$ Maximum ambient temperature
$\theta_{\mathrm{JA}}=$ Thermal resistance of the package
$\mathrm{n}=$ Number of amplifiers in the package
$\mathrm{PD}_{\text {MAX }}=$ Maximum power dissipation of each amplifier in the package

PD ${ }_{\text {MAX }}$ for each amplifier can be calculated as follows:

$$
\mathrm{PD}_{\mathrm{MAX}}=\left(2 \times \mathrm{V}_{\mathrm{S}} \times \mathrm{I}_{\text {SMAX }}\right)+\left[\left(\mathrm{V}_{\mathrm{S}}-\mathrm{V}_{\text {OUTMAX }}\right) \times \frac{\mathrm{V}_{\text {OUTMAX }}}{R_{\mathrm{L}}}\right]
$$

where:
$\mathrm{V}_{\mathrm{S}}=$ Supply voltage
ISMAX = Maximum supply current of 1 A
$\mathrm{V}_{\text {OUTMAX }}=$ Maximum output voltage (required)
$R_{L}=$ Load resistance
