Power supply unit for LCD drives BP5313

The BP5313 is a power supply unit designed to drive LCD panels. Using this unit makes it easy to create a + 40V power supply from a logic circuit (+12V) to drive an LCD.

Applications

LCD panels for personal computers, word processors, and other equipment; LCD display units

Features

- 1) High efficient power conversion (83%).
- 2) Internal short-circuit protection.

3) Low height makes this product ideal for thin-panel sets.

Operation notes

- (1)External input/output capacitors should be positioned as close as possible to pins, and the impedance, particularly between capacitor C1 and Pin 11 on the onput side, should be kept as low as possible. (Reference value: approx. 50 mm or less for a width of 1.0 mm and thickness of 35 μm)
- (2)The power supply should not be turned on and off repeatedly(more than 5 times/second).
