## 8-bit Microcontroller

## CMOS

## F²MC-8FX MB95150M Series

## MB95156M/F156M/F156N/F156J/FV100D-103

■ DESCRIPTION
The MB95150M series is general-purpose, single-chip microcontrollers. In addition to a compact instruction set, the microcontrollers contain a variety of peripheral functions.
Note : F²MC is the abbreviation of FUJITSU Flexible Microcontroller.

## ■ FEATURE

- ${ }^{2}$ MC-8FX CPU core

Instruction set optimized for controllers

- Multiplication and division instructions
- 16-bit arithmetic operations
- Bit test branch instruction
- Bit manipulation instructions etc.
- Clock
- Main clock
- Main PLL clock
- Sub clock
- Sub PLL clock
(Continued)

Be sure to refer to the "Check Sheet" for the latest cautions on development.

[^0]"Check Sheet" lists the minimal requirement items to be checked to prevent problems beforehand in system development.

## MB95150M Series

(Continued)

- Timer
- 8/16-bit compound timer $\times 2$ channels

Can be used to interval timer, PWC timer, PWM timer and input capture.

- 8/16-bit PPG $\times 2$ channels
- 16 -bit PPG $\times 1$ channel
- Time-base timer $\times 1$ channel
- Watch prescaler $\times 1$ channel
- LIN-UART $\times 1$ channel
- LIN function, clock asynchronous (UART) or clock synchronous (SIO) serial data transfer capable
- Full duplex double buffer
- UART/SIO $\times 1$ channel
- Clock asynchronous (UART) or clock synchronous (SIO) serial data transfer capable
- Full duplex double buffer
- External interrupt $\times 8$ channels
- Interrupt by edge detection (rising, falling, or both edges can be selected)
- Can be used to recover from low-power consumption (standby) modes.
- 8/10-bit A/D converter $\times 8$ channels

8 -bit or 10-bit resolution can be selected.

- LCD controller (LCDC)
- 16 SEG $\times 4$ COM (Max 64 pixels)
- With blinking function
- Low-power consumption (standby) mode
- Stop mode
- Sleep mode
- Watch mode
- Time-base timer mode
- I/O port: Max 39
- General-purpose I/O ports (CMOS) : 39 ports
- Programmable input voltage levels of port

Automotive input level / CMOS input level / hysteresis input level

- Flash memory security function

Protects the content of Flash memory (Flash memory device only)

## - PRODUCT LINEUP

## MB95150M Series

## DIFFERENCES AMONG PRODUCTS AND NOTES ON SELECTING PRODUCTS

- Notes on Using Evaluation Products

The Evaluation product has not only the functions of the MB95150M series but also those of other products to support software development for multiple series and models of the $\mathrm{F}^{2} \mathrm{MC}-8 \mathrm{FX}$ family. The I/O addresses for peripheral resources not used by the MB95150M series are therefore access-barred. Read/write access to these access-barred addresses may cause peripheral resources supposed to be unused to operate, resulting in unexpected malfunctions of hardware or software.
Particularly, do not use word access to odd numbered byte address in the prohibited areas (If these access are used, the address may be read or written unexpectedly).

Also, as the read values of prohibited addresses on the evaluation product are different to the values on the Flash memory and MASK ROM products, do not use these values in the program.
The functions corresponding to certain bits in single-byte registers may not be supported on some mask ROM and Flash memory products. However, reading or writing to these bits will not cause malfunction of the hardware. Also, as the evaluation, Flash memory, and mask ROM products are designed to have identical software operation, no particular precautions are required.

- Difference of Memory Spaces

If the amount of memory on the Evaluation product is different from that of the Flash memory product or MASK ROM product, carefully check the difference in the amount of memory from the model to be actually used when developing software.
For details of memory space, refer to "■ CPU CORE".

- Current Consumption
- The current consumption of Flash memory product is typically greater than for MASK ROM product.
- For details of current consumption, refer to "■ ELECTRICAL CHARACTERISTICS".
- Package

For details of information on each package, refer to "■ PACKAGES AND CORRESPONDING PRODUCTS" and "■ PACKAGE DIMENSIONS".

- Operating voltage

The operating voltage are different between the Evaluation, Flash memory products, and MASK ROM product. For details of operating voltage, refer to " $\square$ ELECTRICAL CHARACTERISTICS".

## MB95150M Series

## - HANDLING DEVICES

- Preventing Latch-up

Care must be taken to ensure that maximum voltage ratings are not exceeded when they are used.
Latch-up may occur on CMOS ICs if voltage higher than Vcc or lower than Vss is applied to input and output pins other than medium- and high-withstand voltage pins or if higher than the rating voltage is applied between $\mathrm{V}_{\mathrm{cc}}$ pin and Vss pin.
When latch-up occurs, power supply current increases rapidly and might thermally damage elements.

- Stable Supply Voltage

Supply voltage should be stabilized.
A sudden change in power-supply voltage may cause a malfunction even within the guaranteed operating range of the Vcc power-supply voltage.

For stabilization, in principle, keep the variation in Vcc ripple ( $p-p$ value) in a commercial frequency range $(50 / 60 \mathrm{~Hz})$ not to exceed $10 \%$ of the standard Vcc value and suppress the voltage variation so that the transient variation rate does not exceed $0.1 \mathrm{~V} / \mathrm{ms}$ during a momentary change such as when the power supply is switched.

- Precautions for Use of External Clock

Even when an external clock is used, oscillation stabilization wait time is required for power-on reset, wake-up from sub clock mode or stop mode.

- PIN CONNECTION
- Treatment of Unused Pin

Leaving unused input pins unconnected can cause abnormal operation or latch-up, leaving to permanent damage. Unused input pins should always be pulled up or down through resistance of at least $2 \mathrm{k} \Omega$. Any unused input/output pins may be set to output mode and left open, or set to input mode and treated the same as unused input pins. If there is unused output pin, make it to open.

- Power Supply Pins

In products with multiple $\mathrm{V}_{\mathrm{cc}}$ or V ss pins, the pins of the same potential are internally connected in the device to avoid abnormal operations including latch-up. However, you must connect the pins to external power supply and a ground line to lower the electro-magnetic emission level, to prevent abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total output current rating.
Moreover, connect the current supply source with the $\mathrm{V}_{\mathrm{cc}}$ and $\mathrm{V}_{\text {ss }}$ pins of this device at the low impedance.
It is also advisable to connect a ceramic bypass capacitor of approximately $0.1 \mu \mathrm{~F}$ between V cc and V ss pins near this device.

## MB95150M Series

- Mode Pin (MOD)

Connect the MOD pin directly to Vcc or Vss.
To prevent the device unintentionally entering test mode due to noise, lay out the printed circuit board so as to minimize the distance from the MOD pin to $\mathrm{V}_{\mathrm{cc}}$ or $\mathrm{V}_{\text {ss }}$ pins and to provide a low-impedance connection.

Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. A bypass capacitor of $\mathrm{V}_{\mathrm{cc}}$ pin must have a capacitance value higher than Cs . For connection of smoothing capacitor Cs , refer to the diagram below.

- C pin connection diagram

- NC Pins

Any pins marked "NC" (not connected) must be left open.

## MB95150M Series

## ■ PROGRAMMING FLASH MEMORY MICROCONTROLLERS USING PARALLEL PROGRAMMER

## - Supported Parallel Programmers and Adapters

The following table lists supported parallel programmers and adapters.

| Package | Applicable adapter model | Parallel programmers |
| :---: | :---: | :---: |
| FPT-48P-M26 | TEF110-95F156HPFV | AF9708 (Ver 02.35G or more) |
| AF97-52P-M01 | TEF110-95F156HPMC | AF9723+AF9834 (Ver 02.35G or more) |
| APT.08E or more) |  |  |

Note : For information on applicable adapter models and parallel programmers, contact the following: Flash Support Group, Inc. TEL: +81-53-428-8380

## - Sector Configuration

The individual sectors of Flash memory correspond to addresses used for CPU access and programming by the parallel programmer as follows:

- MB95F156M/F156N/F156J

| Flash memory | CPU address | Programmer address* |
| :---: | :---: | :---: |
| 32 Kbytes |  |  |
|  | FFFFH | 1FFFFH |

*: Programmer addresses are corresponding to CPU addresses, used when the parallel programmer programs data into Flash memory.
These programmer addresses are used for the parallel programmer to program or erase data in Flash memory.

## - Programming Method

1) Set the type code of the parallel programmer to 17222.
2) Load program data to programmer addresses 18000 to 1 FFFFн.
3) Programmed by parallel programmer.

## MB95150M Series

## BLOCK DIAGRAM

## MB95150M Series

## CPU CORE

## 1. Memory space

Memory space of the MB95150M series is 64 Kbytes and consists of I/O area, data area, and program area. The memory space includes special-purpose areas such as the general-purpose registers and vector table.
Memory map of the MB95150M series is shown below.

- Memory Map

|  | MB95156M |
| :---: | :---: |
| 0000H | I/O |
| 0080H | RAM 1 Kbyte |
| 0100H | Register |
| 0200H |  |
| 0480H | Access prohibited |
| OF80н | Extended I/O |
| 1000H |  |
|  | Access prohibited |
| 8000 H |  |
|  | MASK ROM 32 Kbytes |
| FFFFH |  |

|  | MB95FV100D-103 |
| :---: | :---: |
| 0000H | I/O |
| 0080H | RAM 3.75 Kbytes |
| 0100H | Register |
| 0200H |  |
| 0F80H | Extended I/O |
| 1000H |  |
|  | Flash memory 60 Kbytes |
| FFFFH |  |

## MB95150M Series

## 2. Register

The MB95150M series has two types of registers; dedicated registers in the CPU and general-purpose registers in the memory. The dedicated registers are as follows:
Program counter (PC) : A 16-bit register to indicate locations where instructions are stored.
Accumulator (A) : A 16-bit register for temporary storage of arithmetic operations. In the case of an 8 -bit data processing instruction, the lower 1 byte is used.
Temporary accumulator ( T ) : A 16-bit register which performs arithmetic operations with the accumulator. In the case of an 8 -bit data processing instruction, the lower 1 byte is used.
Index register (IX) : A 16-bit register for index modification.
Extra pointer (EP) : A 16-bit pointer to point to a memory address.
Stack pointer (SP) : A 16-bit register to indicate a stack area.
Program status (PS) : A 16-bit register for storing a register bank pointer, a direct bank pointer, and a condition code register.

| : Program counter | FFFD |
| :--- | :--- |
| : Accumulator | $0000_{H}$ |
| : Temporary accumulator | $0000_{\mathrm{H}}$ |
| : Index register | $0000_{\mathrm{H}}$ |
| : Extra pointer | $0000_{\mathrm{H}}$ |
| : Stack pointer | $0000_{\mathrm{H}}$ |
| : Program status | $0030_{\mathrm{H}}$ |

The PS can further be divided into higher 8 bits for use as a register bank pointer (RP) and a direct bank pointer (DP) and the lower 8 bits for use as a condition code register (CCR) . (Refer to the diagram below.)

- Structure of the Program Status

## MB95150M Series

The RP indicates the address of the register bank currently being used. The relationship between the content of RP and the real address conforms to the conversion rule illustrated below:

- Rule for Conversion of Actual Addresses in the General-purpose Register Area

|  |  |  |  |  |  |  |  |  | RP upper |  |  |  | OP code lower |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | "0" | "0" | "0" | "0" | "0" | "0" | "0" | "1" | R4 | R3 | R2 | R1 | R0 | b2 | b1 | b0 |
|  | $\downarrow$ | 1 | $\dagger$ | $\downarrow$ | $\downarrow$ | $\downarrow$ | $\downarrow$ | $\downarrow$ | $\downarrow$ | $\downarrow$ | $\downarrow$ | $\downarrow$ | $\downarrow$ | $\dagger$ | $\downarrow$ | $\dagger$ |
| Generated address | A15 | A14 | A13 | A12 | A11 | A10 | A9 | A8 | A7 | A6 | A5 | A4 | A3 | A2 | A1 | A0 |

The DP specifies the area for mapping instructions (16 different instructions such as MOV A, dir) using direct addresses to 0080н to 00FFн.

| Direct bank pointer (DP2 to DP0) | Specified address area | Mapping area |
| :---: | :---: | :---: |
| XXX ${ }_{\text {( }}$ (no effect to mapping) | 0000 to 007F\% | 0000н to 007F (without mapping) |
| 0008 (initial value) | 0080 to $^{005 F} \mathbf{H}$ | 0080н to 00FFн (without mapping) |
| 001в |  | 0100н to 017Fн |
| 010в |  | 0180 to 01FFH $^{\text {0 }}$ |
| 011в |  | 0200 to 027Fн |
| 100в |  | 0280 to $02 \mathrm{FFH}^{\text {¢ }}$ |
| 101в |  | 0300 to 037 ${ }^{\text {H }}$ |
| 110в |  | 0380 ${ }_{\text {to }}$ 03FF\% |
| 111в |  | 0400н to 047F\% |

The CCR consists of the bits indicating arithmetic operation results or transfer data contents and the bits that control CPU operations at interrupt.

H flag : Set to " 1 " when a carry or a borrow from bit 3 to bit 4 occurs as a result of an arithmetic operation. Cleared to " 0 " otherwise. This flag is for decimal adjustment instructions.
I flag : Interrupt is enabled when this flag is set to " 1 ". Interrupt is disabled when this flag is set to " 0 ". The flag is set to " 0 " when reset.
IL1, ILO : Indicates the level of the interrupt currently enabled. Processes an interrupt only if its request level is higher than the value indicated by these bits.

| IL1 | ILO | Interrupt level | Priority |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | High |
| 0 | 1 | 1 |  |
| 1 | 0 | 2 |  |
| 1 | 1 | 3 |  |

[^1]
## MB95150M Series

The following general-purpose registers are provided:
General-purpose registers: 8-bit data storage registers

The general-purpose registers are 8 bits and located in the register banks on the memory. 1-bank contains 8 -register. Up to a total of 32 banks can be used on the MB95150M series. The bank currently in use is specified by the register bank pointer (RP), and the lower 3 bits of OP code indicates the general-purpose register 0 (R0) to general-purpose register 7 (R7).

## MB95150M Series

(Continued)
*1 : The parameter is based on $\mathrm{V} s \mathrm{~s}=0.0 \mathrm{~V}$.
*2 : V0 to V 3 should not exceed $\mathrm{Vcc}+0.3 \mathrm{~V}$.
*3: V and Vo should not exceed $\mathrm{V} c \mathrm{c}+0.3 \mathrm{~V}$. V ı must not exceed the rating voltage. However, if the maximum current to/from an input is limited by some means with external components, the Iclamp rating supersedes the $\mathrm{V}_{1}$ rating.
*4 : Applicable to pins : P00 to P07, P10 to P14, P60 to P67, P90 to P95, PA0 to PA3, PB0 to PB7

- Use within recommended operating conditions.
- Use at DC voltage (current).
- +B signal is an input signal that exceeds Vcc voltage. The +B signal should always be applied a limiting resistance placed between the +B signal and the microcontroller.
- The value of the limiting resistance should be set so that when the $+B$ signal is applied the input current to the microcontroller pin does not exceed rated values, either instantaneously or for prolonged periods.
- Note that when the microcontroller drive current is low, such as in the power saving modes, the +B input potential may pass through the protective diode and increase the potential at the $\mathrm{V}_{\mathrm{cc}} \mathrm{pin}$, and this affects other devices.
- Note that if the $+B$ signal is inputted when the microcontroller power supply is off (not fixed at 0 V ), the power supply is provided from the pins, so that incomplete operation may result.
- Note that if the + B input is applied during power-on, the power supply is provided from the pins and the resulting power supply voltage may not be sufficient to operate the power-on reset.
- Care must be taken not to leave the + B input pin open.
- Note that analog system input/output pins other than the A/D input pins (LCD drive pins, etc.) cannot accept + B signal input.
- Sample recommended circuits :
- Input/Output Equivalent circuits

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

|  |  |  | Min | Max |  |  |  |
| Power supply voltage | Vcc | - | $2.4{ }^{* 1, * 2}$ | 5.5*1 | V | In normal operating | Other than MB95FV100D-103 |
|  |  |  | 2.3 | 5.5 |  | Hold condition in STOP mode |  |
|  |  |  | 2.7 | 5.5 |  | In normal operating | MB95FV100D-103 |
|  |  |  | 2.3 | 5.5 |  | Hold condition in STOP mode |  |
| Power supply voltage for LCD | V0 to V3 |  | Vss | Vcc | V | The range of liquid crystal power supply (The optimal value depends on liquid crystal display elements used.) |  |
| Smoothing capacitor | Cs |  | 0.1 | 1.0 | $\mu \mathrm{F}$ | *3 |  |
| Operating temperature | TA |  | -40 | +85 | ${ }^{\circ} \mathrm{C}$ | Other than MB95FV100D-103 |  |
|  |  |  | +5 | +35 | ${ }^{\circ} \mathrm{C}$ | MB95FV100D-103 |  |

*1: The values vary with the operating frequency, machine clock or analog guarantee range.
*2 : The value is 2.88 V when the low voltage detection reset is used.
*3 : Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. A bypass capacitor of $\mathrm{V}_{c c}$ pin must have a capacitance value higher than Cs . For connection of smoothing capacitor Cs , refer to the diagram below.

## MB95150M Series

- C pin connection diagram

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.
Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.
No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

*1: P10 and P67 can switch the input level to either the "CMOS input level" or "hysteresis input level".
The switching of the input level can be set by the input level selection register (ILSR).
*2 : Product without clock supervisor only
*3 : - The power-supply current is determined by the external clock. When both low voltage detection option and clock supervisor are selected, the power-supply current will be a value of adding current consumption of the low voltage detection circuit (Ivv) and current consumption of built-in CR oscillator (Icsv) to the specified value.

## MB95150M Series

## (2) Notes on Using A/D Converter

## - About the external impedance of analog input and its sampling time

A/D converter with sample and hold circuit. If the external impedance is too high to keep sufficient sampling time, the analog voltage charged to the internal sample and hold capacitor is insufficient, adversely affecting A/ $D$ conversion precision. Therefore, to satisfy the $A / D$ conversion precision standard, consider the relationship between the external impedance and minimum sampling time and either adjust the register value and operating frequency or decrease the external impedance so that the sampling time is longer than the minimum value. Also, if the sampling time cannot be sufficient, connect a capacitor of about $0.1 \mu \mathrm{~F}$ to the analog input pin.

- Analog input equivalent circuit

During sampling: ON

$$
\begin{array}{ccc} 
& \text { R } & \text { C } \\
4.5 \mathrm{~V} \leq \mathrm{V} \mathrm{cc} \leq 5.5 \mathrm{~V} & 2.0 \mathrm{k} \Omega(\mathrm{Max}) & 16 \mathrm{pF}(\mathrm{Max}) \\
4.0 \mathrm{~V} \leq \mathrm{V} \mathrm{cc}<4.5 \mathrm{~V} & 8.2 \mathrm{k} \Omega \text { (Max) } & 16 \mathrm{pF} \text { (Max) }
\end{array}
$$

Note : The values are reference values.

- The relationship between external impedance and minimum sampling time

## - About errors

As $\operatorname{IV} \mathrm{cc}$ - Vssl becomes smaller, values of relative errors grow larger.

## MB95150M Series

## (3) Definition of A/D Converter Terms

- Resolution

The level of analog variation that can be distinguished by the $A / D$ converter.
When the number of bits is 10 , analog voltage can be divided into $2^{10}=1024$.

- Linearity error (unit : LSB)

The deviation between the value along a straight line connecting the zero transition point
("00 00000000 " $\leftarrow \rightarrow$ "00 00000001 ") of a device and the full-scale transition point
("11 $11111111 " \leftarrow \rightarrow$ "11 11111110") compared with the actual conversion values obtained.

- Differential linear error (Unit : LSB)

Deviation of input voltage, which is required for changing output code by 1 LSB , from an ideal value.

- Total error (unit: LSB)

Difference between actual and theoretical values, caused by a zero transition error, full-scale transition error, linearity error, quantum error, and noise.
