## AC CHARACTERISTICS (AC operating conditions unless otherwise noted)

Refer to the individual component, not the whole module.

Parameter		Symbol	Value		Unit	Note
			Min	Max		
CLK cycle time	CAS latency=3	tCC	10	1000	ns	1
	CAS latency=2		12			
CLK to valid output delay	CAS latency=3	tsAC		6	ns	1, 2

CLK to output in Low-Z		tSLZ	1		ns	2
CLK to output in Hi-Z	CAS latency=3	tSHZ		6	ns	
	CAS latency=2			7		

- Note:**
- Parameters depend on programmed CAS latency.
  - If clock rising time is longer than 1ns,  $(tr/2-0.5)$  ns should be added to the parameter.
  - Assumed input rise and fall time ( $tr$  &  $tf$ )= 1ns.  
If  $tr$  &  $tf$  is longer than 1ns, transient time compensation should be considered, i.e.,  $[(tr + tf)/2-1]$ ns should be added to the parameter.

#### Note:

- OP Code: Operand Code  
A<sub>0~A11</sub>, BA<sub>0~BA1</sub>: Program keys. (@MRS)
- MRS can be issued only at both banks precharge state.  
A new command can be issued after 2 CLK cycles of MRS.
- Auto refresh functions are as same as CBR refresh of DRAM.  
The automatically precharge without row precharge command is meant by "Auto".  
Auto/self refresh can be issued only at both banks precharge state.
- BA<sub>0~BA1</sub>: Bank select address.  
If both BA<sub>0</sub> and BA<sub>1</sub> are "Low" at read, write, row active and precharge, bank A is selected.  
If both BA<sub>0</sub> is "Low" and BA<sub>1</sub> is "High" at read, write, row active and precharge, bank B is selected.  
If both BA<sub>0</sub> is "High" and BA<sub>1</sub> is "Low" at read, write, row active and precharge, bank C is selected.  
If both BA<sub>0</sub> and BA<sub>1</sub> are "High" at read, write, row active and precharge, bank D is selected.  
If A<sub>10/AP</sub> is "High" at row precharge, BA<sub>0</sub> and BA<sub>1</sub> is ignored and both banks are selected.
- During burst read or write with auto precharge, new read/write command cannot be issued.  
Another bank read/write command can be issued after the end of burst.  
New row active of the associated bank can be issued after tRP after the end of burst.
- Burst stop command is valid at every burst length.
- DQM sampled at positive going edged of a CLK masks the data-in at the very CLK (Write DQM latency is 0), but makes Hi-Z state the data-out of 2 CLK cycles after. (Read DQM latency is 2)
