Features

- Fast Acquisition to 0.01% 70ns (Max)
- Low Offset Error $\pm 2\text{mV}$ (Max)
- Low Pedestal Error $\pm 10\text{mV}$ (Max)
- Low Droop Rate $2\mu\text{V}/\mu\text{s}$ (Max)
- Wide Unity Gain Bandwidth 40MHz
- Low Power Dissipation per Amp 220mW (Max)
- Total Harmonic Distortion (Hold Mode) -72dBc
($V_{IN} = 5\text{V}_{P-P}$ at 1MHz)
- Fully Differential Inputs
- On Chip Hold Capacitor

Applications

- Synchronous Sampling
- Wide Bandwidth A/D Conversion
- Deglitching
- Peak Detection
- High Speed DC Restore

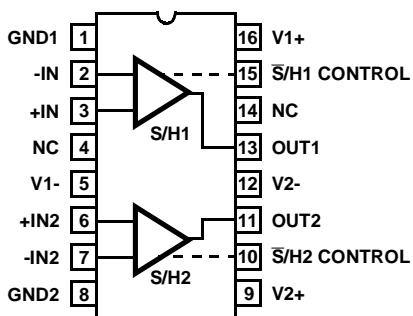

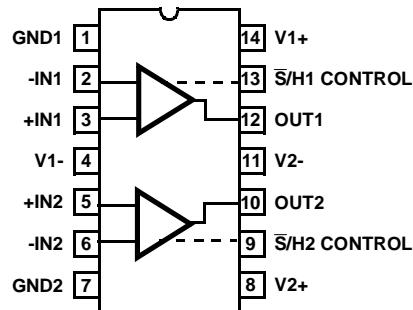

Description

The HA5352 is a fast acquisition, wide bandwidth Dual Sample and Hold amplifier built with the Intersil HBC-10 BiCMOS process. This Sample and Hold amplifier offers the combination of features; fast acquisition time (70ns to 0.01%), excellent DC precision and extremely low power dissipation, making it ideal for use in multi-channel systems that require low power.

The HA5352 comes in an open loop configuration with fully differential inputs providing flexibility for user defined feedback. In unity gain the HA5352 is completely self-contained and requires no external components. The on-chip 15pF hold capacitors are completely isolated to minimize droop rate and reduce the sensitivity of pedestal error. The HA5352 Dual Sample and Hold is available in a 14 lead PDIP and 16 lead SOIC packages saving board space while its pinout is designed to simplify layout.

Specifications HA5352

Absolute Maximum Ratings

Voltage Between V+ and V- Terminals	+11V
Differential Input Voltage	+6V
Voltage between S/H control and ground	+5.5V
Output Current, Continuous	$\pm 37\text{mA}$
Junction Temperature (Plastic Packages)	+150°C
Lead Temperature (Soldering, 10s)	+300°C (SOIC - Lead Tips Only)

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

Electrical Specifications

Test Conditions: $V_{\text{SUPPLY}} = \pm 5\text{V}$; $C_H = \text{Internal} = 15\text{pF}$, Digital Input: $V_{IL} = +0.0\text{V}$ (Sample), $V_{IH} = 4.0\text{V}$ (Hold). Non-Inverting Unity Gain Configuration (Output Tied to -Input), $C_L = 5\text{pF}$, Unless Otherwise Specified

NOTES:

1. Absolute maximum ratings are limiting values, applied individually, beyond which the serviceability of the circuit may be impaired. Functional operation under any of these conditions is not necessarily implied.
2. Derived from Computer Simulation only, not tested.
3. +CMRR is measured from 0V to +2.5V, -CMRR is measured from 0V to -2.5V.
