Lovoltech™

Breakthrough Power JFET Technology

PWRLITE LD1106S

High Performance N-Channel *POWERJFET™* with Schottky Diode

Features

- Trench Power JFET with low threshold voltage Vth.
- Device fully "ON" with Vgs = 0.7V
- Optimum for "Low Side" Buck Converters
- Optimized for Secondary Rectification in isolated DC-DC
- Low Rg and low Cds for high speed switching
- No "Body Diode"; extremely low Cds
- Added Fast Recovery Schottky Diode in same package

Applications

- DC-DC Converters for DDR and Graphic designs
- Synchronous Rectifiers
- PC Motherboard Converters
- Step-down power supplies
- Brick Modules
- VRM Modules

Description

The Power JFET transistor from Lovoltech is a device that presents a Low Rdson allowing for improved efficiencies in DC-DC switching applications. The device is designed with a low threshold such that drivers can operate at 5V, which reduces the driver power dissipation and increases the overall efficiency. Lower threshold produces faster turn-on/turn-off, which minimizes the required dead time. The transistor "No Body Diode" provides a very low associated parasitic capacitance Cds. A Schottky Diode is added for applications where a freewheeling diode is required. Ringing is also reduced so that a lower voltage device may be a better solution.
