LD39300

Ultra low drop BICMOS voltage regulator

Feature summary

- 3A Guaranteed output current
- Ultra low dropout voltage (200mV typ. @ 3A load, 40mV typ. @600mA load)
- Very low quiescent current (1.2mA typ. @ 3A load, 1µA max @ 25°C in off mode)
- Logic-controlled electronic shutdown
- Current and thermal internal limit
- ±1.5% Output voltage tolerance @ 25°C
- Fixed and ADJ output voltages: 1.22V, 1.8V, 2.5V, 3.3V, ADJ. (*see order code)
- Temperature range: -40 to 125°C
- Fast dynamic response to line and load changes
- Stable with ceramic capacitor (see paragraph 7.1, 7.2, 7.3)
- Available in PPAK and DPAK

Typical application

- Microprocessor power supply
- DSPs power supply
- Post regulators for switchin suppliers
- High efficiency linear regulator

Description

The LD39300 is a fast ultra low drop linear regulator which operates from 2.5V to 6V input supply.

A wide range of output options are available. The low drop voltage, low noise, and ultra low quiescent current make it suitable for low voltage microprocessor and memory applications. The device is developed on a BiCMOS process which allows low quiescent current operation independently of output load current.

7 Application notes

7.1 External capacitors

The LD39300 requires external capacitors for regulator stability. These capacitors must be selected to meet the requirements of minimum capacitance and equivalent series resistance (see *Figure 14. Figure 15.*). The input/output capacitors must be located less than 1cm from the relative pins and connected directly to the input/output ground pins using traces which have no other currents flowing through them. Any good quality of Ceramic or Electrolytic capacitors can be used.

7.2 Input capacitor

An input capacitor whose minimum value is 1µF is required with the LD39300 (amount of capacitance can be increased without limit). This capacitor must be located a distance of not more than 1cm from the input pin of the device and returned to a clean analog ground. Any good quality ceramic, tantalum or film capacitors can be used for this capacitor.

7.3 Output capacitor

It is possible to use Ceramic or Tantalum capacitors but the output capacitor must meet the requirement for minimum amount of capacitance and E.S.R. (equivalent series resistance) value. A minimum capacitance of 4.7µF is a good choice to guarantee the stability of the regulator. Anyway, other C_O values can be used according to the (*Figure 14. Figure 15.*) showing the allowable ESR range as a function of the output capacitance. This curve represents the stability region over the full temperature and I_O range.

7.4 Thermal note

The output capacitor must maintain its ESR in the stable region over the full operating temperature range to assure stability. Also, capacitors tolerance and variation with temperature must be kept in consideration in order to assure the minimum amount of capacitance at all times.

7.5 Inhibit input operation

The inhibit pin can be used to turn OFF the regulator when pulled down, so drastically reducing the current consumption down to less than 1µA. When the inhibit feature is not used, this pin must be tied to V_I to keep the regulator output ON at all times. To assure proper operation, the signal source used to drive the inhibit pin must be able to swing above and below the specified thresholds listed in the electrical characteristics section (V_{IH} V_{IL}). The inhibit pin must not be left floating because it is not internally pulled down/up.

8 Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.
