TENTATIVE   TOSHIBA MOS DIGITAL INTEGRATED CIRCUIT   SILICON MONOLITHIC

512Mbits Network FCRAM1 (SSTL_2 Interface)
− 4,194,304-WORDS × 8 BANKS × 16-BITS

Lead-Free

DESCRIPTION

Network FCRAM^{TM} is Double Data Rate Fast Cycle Random Access Memory. TC59LM913AMG is Network FCRAM^{TM} containing 536,870,912 memory cells. TC59LM913AMG is organized as 4,194,304-words × 8 banks × 16 bits. TC59LM913AMG feature a fully synchronous operation referenced to clock edge whereby all operations are synchronized at a clock input which enables high performance and simple user interface coexistence. TC59LM913AMG can operate fast core cycle compared with regular DDR SDRAM.

TC59LM913AMG is suitable for Network, Server and other applications where large memory density and low power consumption are required. The Output Driver for Network FCRAM^{TM} is capable of high quality fast data transfer under light loading condition.

FEATURES

PARAMETER		TC59LM913AMG-50
t_{CK}	Clock Cycle Time (min)	5.0 ns
t_{RC}	Random Read/Write Cycle Time (min)	25.0 ns
t_{RAC}	Random Access Time (max)	22.0 ns
I_{DD1S}	Operating Current (single bank) (max)	240 mA
I_{DD2P}	Power Down Current (max)	80 mA
I_{DD6}	Self-Refresh Current (max)	20 mA

- Fully Synchronous Operation
    - **Double Data Rate (DDR)**
      Data input/output are synchronized with both edges of L/UDQS.
    - **Differential Clock (CLK and $\overline{CLK}$) inputs**
      $\overline{CS}$, FN and all address input signals are sampled on the positive edge of CLK.
      Output data (DQs, LDQS and UDQS) is aligned to the crossings of CLK and $\overline{CLK}$.
- **Fast clock cycle time of 5 ns minimum**
      Clock: 200 MHz maximum
      Data: 400 Mbps/pin maximum
- **Fast cycle and Short Latency**
- **Eight independent banks operation**
      When BA2 input assign to A14 input, TC59LM913AMG can function as 4bank device
      (Keep backward compatibility of address assignment to 256Mb)
- **Bidirectional Data Strobe Signal**
- **Distributed Auto-Refresh cycle in 3.9 μs**
- **Self-Refresh**
- **Power Down Mode**
- **Variable Write Length Control**
- **Write Latency = $\overline{CAS}$ Latency-1**
- **Programable $\overline{CAS}$ Latency and Burst Length**
      $\overline{CAS}$ Latency = 4
      Burst Length = 2, 4
- **Organization: TC59LM913AMG :   4,194,304 words × 8 banks × 16 bits**
- **Power Supply Voltage   V$_{DD}$:   2.5 V ± 0.15V**
      V$_{DDQ}$:   2.5 V ± 0.15 V
- **2.5 V CMOS I/O comply with SSTL_2 (half strength driver)**
- **Package: 60Ball BGA, 1mm × 1mm Ball pitch (P−BGA64−1317−1.00AZ)**
- **Lead-Free .**

**Notice : FCRAM is trademark of Fujitsu Limited, Japan.**

Rev 1.1

PIN NAMES

PIN	NAME
A0~A13	Address Input
BA0~BA2	Bank Address
DQ0~DQ15	Data Input/Output
$\overline{CS}$	Chip Select
FN	Function Control
$\overline{PD}$	Power Down Control
CLK, $\overline{CLK}$	Clock Input

| PIN	NAME
UDQS, LDQS	Write/Read Data Strobe
V_{DD}	Power (+2.5 V)
V_{SS}	Ground
V_{DDQ}	Power (+2.5 V) (for I/O buffer)
V_{SSQ}	Ground (for I/O buffer)
V_{REF}	Reference Voltage
NC	Not Connected

4 bank operation can be performed using BA2 as A14.

PIN ASSIGNMENT (TOP VIEW)

ball pitch=1.0 x 1.0mm

BLOCK DIAGRAM

Note: TC59LM913AMG configuration is 8 Bank of 16384 x 256 x 16 of cell array with DQ pins numbered DQ0~DQ15.

ABSOLUTE MAXIMUM RATINGS

| SYMBOL	PARAMETER	RATING	UNIT	NOTES
V_{DD}	Power Supply Voltage	−0.3~3.3	V	
V_{DDQ}	Power Supply Voltage (for I/O buffer)	−0.3~V_{DD}+ 0.3	V	
V_{IN}	Input Voltage	−0.3~V_{DD}+ 0.3	V	
V_{OUT}	Output and I/O pin Voltage	−0.3~V_{DDQ} + 0.3	V	
V_{REF}	Input Reference Voltage	−0.3~V_{DD}+ 0.3	V	
T_{CASE}	Operating Temperature (case)	0~85	°C	
T_{stg}	Storage Temperature	−55~150	°C	
T_{solder}	Soldering Temperature (10 s)	260	°C	
P_D	Power Dissipation	2	W	
I_{OUT}	Short Circuit Output Current	±50	mA	

Caution: Conditions outside the limits listed under "ABSOLUTE MAXIMUM RATINGS" may cause permanent damage to the device. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification.

Exposure to "ABSOLUTE MAXIMUM RATINGS" conditions for extended periods may affect device reliability.

RECOMMENDED DC, AC OPERATING CONDITIONS (Notes: 1)(T_{CASE} = 0~85°C)

SYMBOL	PARAMETER	MIN	TYP.	MAX	UNIT	NOTES
V_{DD}	Power Supply Voltage	2.35	2.5	2.65	V	
V_{DDQ}	Power Supply Voltage (for I/O buffer)	2.35	V_{DD}	V_{DD}	V	
V_{REF}	Input Reference Voltage	$V_{DDQ}/2 \times 96\%$	$V_{DDQ}/2$	$V_{DDQ}/2 \times 104\%$	V	2
V_{IH} (DC)	Input DC High Voltage	$V_{REF} + 0.2$	—	$V_{DDQ} + 0.2$	V	5
V_{IL} (DC)	Input DC Low Voltage	−0.1	—	$V_{REF} - 0.2$	V	5
V_{ICK} (DC)	Differential Clock DC Input Voltage	−0.1	—	$V_{DDQ} + 0.1$	V	10
V_{ID} (DC)	Input Differential Voltage. CLK and $\overline{CLK}$ inputs (DC)	0.4	—	$V_{DDQ} + 0.2$	V	7, 10
V_{IH} (AC)	Input AC High Voltage	$V_{REF} + 0.35$	—	$V_{DDQ} + 0.2$	V	3, 6
V_{IL} (AC)	Input AC Low Voltage	−0.1	—	$V_{REF} - 0.35$	V	4, 6
V_{ID} (AC)	Input Differential Voltage. CLK and $\overline{CLK}$ inputs (AC)	0.7	—	$V_{DDQ} + 0.2$	V	7, 10
V_X (AC)	Differential AC Input Cross Point Voltage	$V_{DDQ}/2 - 0.2$	—	$V_{DDQ}/2 + 0.2$	V	8, 10
V_{ISO} (AC)	Differential Clock AC Middle Level	$V_{DDQ}/2 - 0.2$	—	$V_{DDQ}/2 + 0.2$	V	9, 10

NOTES:

  (1)   All voltages referenced to V_{SS}, V_{SSQ}.

  (2) V_{REF} is expected to track variations in V_{DDQ} DC level of the transmitting device.
Peak to peak AC noise on V_{REF} may not exceed $\pm 2\%$ V_{REF} (DC).

  (3)   Overshoot limit: $V_{IH\,(max)} = V_{DDQ} + 0.9$ V with a pulse width ≤ 5 ns.

  (4)   Undershoot limit: $V_{IL\,(min)} = -0.9$ V with a pulse width ≤ 5 ns.

  (5) V_{IH} (DC) and V_{IL} (DC) are levels to maintain the current logic state.

  (6) V_{IH} (AC) and V_{IL} (AC) are levels to change to the new logic state.

  (7) V_{ID} is magnitude of the difference between CLK input level and $\overline{CLK}$ input level.

  (8)   The value of V_X (AC) is expected to equal $V_{DDQ}/2$ of the transmitting device.

  (9) V_{ISO} means $\{V_{ICK}\,(CLK) + V_{ICK}\,(\overline{CLK})\}\,/2$

  (10)   Refer to the figure below.
  (11)   In the case of external termination, VTT (termination voltage) should be gone in the range of V_{REF} (DC) $\pm\,0.04$ V.

CAPACITANCE ($V_{DD} = 2.5$V, $V_{DDQ} = 2.5$ V, f = 1 MHz, Ta = 25°C)

SYMBOL	PARAMETER	MIN	MAX	Delta	UNIT
C_{IN}	Input pin Capacitance	1.5	2.5	0.25	pF
C_{INC}	Clock pin (CLK, $\overline{CLK}$) Capacitance	1.5	2.5	0.25	pF
$C_{I/O}$	DQ, UDQS, LDQS Capacitance	2.5	4.0	0.5	pF
C_{NC}	NC pin Capacitance	—	4.0	—	pF

Note: These parameters are periodically sampled and not 100% tested.

Rev 1.1

RECOMMENDED DC OPERATING CONDITIONS

(V_{DD}=2.5V $\pm$ 0.15V, V_{DDQ}=2.5V $\pm$ 0.15V, T_{CASE} = 0~85°C)

SYMBOL	PARAMETER	MAX	UNIT	NOTES
I_{DD1S}	Operating Current t_{CK} = min, I_{RC} = min ; Read/Write command cycling ; $0\,V \leq V_{IN} \leq V_{IL}$ (AC) (max), V_{IH} (AC) (min) $\leq V_{IN} \leq V_{DDQ}$; 1 bank operation, Burst length = 4 ; Address change up to 2 times during minimum I_{RC}.	240		1, 2
I_{DD2N}	Standby Current t_{CK} = min, $\overline{CS}$ = V_{IH}, $\overline{PD}$ = V_{IH} ; $0\,V \leq V_{IN} \leq V_{IL}$ (AC) (max), V_{IH} (AC) (min) $\leq V_{IN} \leq V_{DDQ}$; All banks: inactive state ; Other input signals are changed one time during $4 \times t_{CK}$.	100		1, 2
I_{DD2P}	Standby (power down) Current t_{CK} = min, $\overline{CS}$ = V_{IH}, $\overline{PD}$ = V_{IL} (Power Down) ; $0\,V \leq V_{IN} \leq V_{DDQ}$; All banks: inactive state	80		1, 2
I_{DD4W}	Write Operation Current (4 Banks) 8 Bank Interleaved continuous burst write operation ; t_{CK} = min, I_{RC} = min ; Burst Length = 4, $\overline{CAS}$ Latency = 4 ; $0\,V \leq V_{IN} \leq V_{IL}$ (AC) (max), V_{IH} (AC) (min) $\leq V_{IN} \leq V_{DDQ}$; DQ and L/UDQS inputs change twice per clock cycle	350	mA	1, 2
I_{DD4R}	Read Operation Current (4 Banks) 8 Bank Interleaved contious burst read operation ; t_{CK} = min, I_{RC} = min, I_{OUT} = 0mA ; Burst Length = 4, $\overline{CAS}$ Latency = 4 ; $0\,V \leq V_{IN} \leq V_{IL}$ (AC) (max), V_{IH} (AC) (min) $\leq V_{IN} \leq V_{DDQ}$; Address inputs change once per clock cycle. Read data change twice per clock cycle.	350		1, 2
I_{DD5B}	Burst Auto Refresh Current Refresh command at every I_{REFC} interval ; t_{CK} = min, I_{REFC} = min ; $\overline{CAS}$ Latency = 4 ; $0\,V \leq V_{IN} \leq V_{IL}$ (AC) (max), V_{IH} (AC) (min) $\leq V_{IN} \leq V_{DDQ}$; Address inputs change up to 2 times during minimum I_{REFC}. DQ and L/UDQS inputs change twice per clock cycle.	250		1, 2, 3
I_{DD6}	Self-Refresh Current Self-Refresh mode ; $\overline{PD}$ = 0.2 V, $0\,V \leq V_{IN} \leq V_{DDQ}$	20		2

Notes: 1. These parameters depend on the cycle rate and these values are measured at a cycle rate with the minimum values of t_{CK}, t_{RC} and I_{RC}.
2. These parameters defines the current between V_{DD} and V_{SS}.
3. I_{DD5B} is specified under burst refresh condition. Actual system should use distributed refresh that meet t_{REFI} specification.

Rev 1.1

RECOMMENDED DC OPERATING CONDITIONS (continued)
(V_{DD}=2.5V $\pm$ 0.15V, V_{DDQ}=2.5V $\pm$ 0.15V, T_{CASE} = 0~85°C)

SYMBOL	PARAMETER		MIN	MAX	UNIT	NOTES
I_{LI}	Input Leakage Current (0 V $\leq$ V_{IN} $\leq$ V_{DDQ}, all other pins not under test = 0 V)		−5	5	μA	
I_{LO}	Output Leakage Current (Output disabled, 0 V $\leq$ V_{OUT} $\leq$ V_{DDQ})		−5	5	μA	
I_{REF}	V_{REF} Current		−5	5	μA

AC TEST CONDITIONS

SYMBOL	PARAMETER	VALUE	UNIT	NOTES
$V_{IH\,(min)}$	Input High Voltage (minimum)	$V_{REF} + 0.35$	V	
$V_{IL\,(max)}$	Input Low Voltage (maximum)	$V_{REF} - 0.35$	V	
V_{REF}	Input Reference Voltage	$V_{DDQ}/2$	V	
V_{TT}	Termination Voltage	V_{REF}	V	
V_{SWING}	Input Signal Peak to Peak Swing	1.0	V	
Vr	Differential Clock Input Reference Level	V_X (AC)	V	
V_{ID} (AC)	Input Differential Voltage	1.5	V	
SLEW	Input Signal Minimum Slew Rate	1.0	V/ns	
V_{OTR}	Output Timing Measurement Reference Voltage	$V_{DDQ}/2$	V	9
$$SLEW = (V_{IH\,min}\,(AC) - V_{IL\,max}\,(AC))/\Delta T$$

AC Test Load
NOTES:

(1) Transition times are measured between $V_{IH\,min}$ (DC) and $V_{IL\,max}$ (DC).
Transition (rise and fall) of input signals have a fixed slope.

(2) If the result of nominal calculation with regard to t_{CK} contains more than one decimal place, the result is rounded up to the nearest decimal place.
(i.e., $t_{DQSS} = 0.75 \times t_{CK}$, $t_{CK} = 5$ ns, 0.75×5 ns = 3.75 ns is rounded up to 3.8 ns.)

(3) These parameters are measured from the differential clock (CLK and $\overline{CLK}$) AC cross point.

(4) These parameters are measured from signal transition point of DS crossing V_{REF} level.

(5) The $t_{REFI\,(max)}$ applies to equally distributed refresh method.
The $t_{REFI\,(min)}$ applies to both burst refresh method and distributed refresh method.
In such case, the average interval of eight consecutive Auto-Refresh commands has to be more than 400 ns always. In other words, the number of Auto-Refresh cycles which can be performed within 3.2 μs (8 × 400 ns) is to 8 times in the maximum.

(6) Low Impedance State is specified at $V_{DDQ}/2 \pm 0.2$ V from steady state.

(7) High Impedance State is specified where output buffer is no longer driven.

(8) These parameters depend on the clock jitter. These parameters are measured at stable clock.

(9) Output timing is measured by using Normal driver strength.

Rev 1.1

2005-11-08   10/46

POWER UP SEQUENCE

(1) As for $\overline{PD}$, being maintained by the low state (≤ 0.2 V) is desirable before a power-supply injection.

(2) Apply V$_{DD}$ before or at the same time as V$_{DDQ}$.

(3) Apply V$_{DDQ}$ before or at the same time as V$_{REF}$.

(4) Start clock (CLK, $\overline{CLK}$) and maintain stable condition for 200 μs (min).

(5) After stable power and clock, apply DESL and take $\overline{PD}$ =H.

(6) Issue EMRS to enable DLL and to define driver strength. (Note: 1)

(7) Issue MRS for set $\overline{CAS}$ latency (CL), Burst Type (BT), and Burst Length (BL). (Note: 1)

(8) Issue two or more Auto-Refresh commands (Note: 1).

(9) Ready for normal operation after 200 clocks from Extended Mode Register programming.

NOTES:
  (1)   Sequence 6, 7 and 8 can be issued in random order.
  (2)   L = Logic Low, H = Logic High
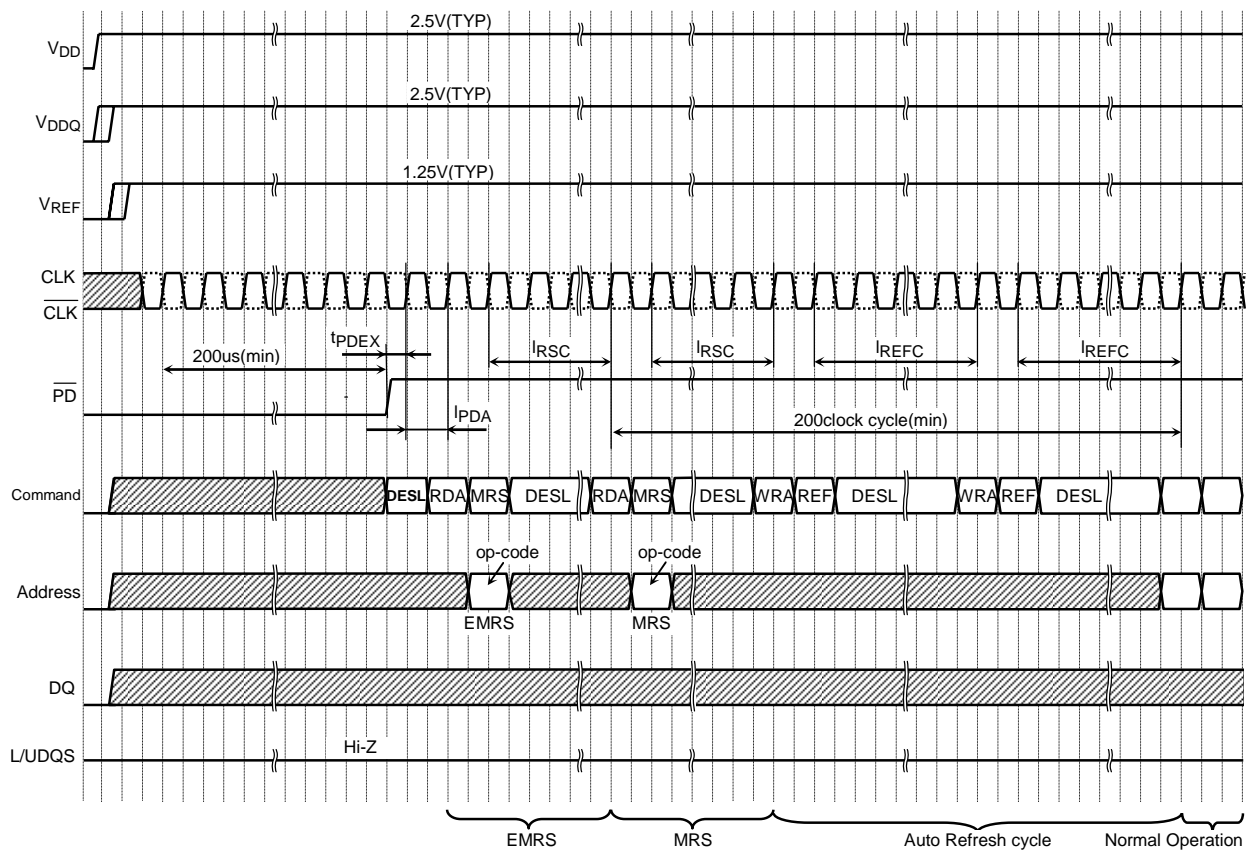

TIMING DIAGRAMS

CLK

$\overline{CLK}$

I_{RC} = 5 cycles I_{REFC} = 18 cycles

Command: RDA | LAL | DESL | WRA | REF | DESL | RDA or WRA | LAL or MRS or REF

Bank, Address: Bank, UA | LA

I_{RCD}=1 cycle I_{RAS} = 4 cycles I_{RCD}=1 cycle

L/UDQS (output): Hi-Z ... Hi-Z

DQ (output): Hi-Z   CL = 4   Q0 Q1 Q2 Q3   Hi-Z

Note: In case of CL = 4, I_{REFC} must be meet 18 clock cycles.
When the Auto-Refresh operation is performed, the synthetic average interval of Auto-Refresh command specified by t_{REFI} must be satisfied.
t_{REFI} is average interval time in 8 Refresh cycles that is sampled randomly.

t_1 t_2 t_3 t_7 t_8

CLK

WRA REF | WRA REF | WRA REF | WRA REF | WRA REF
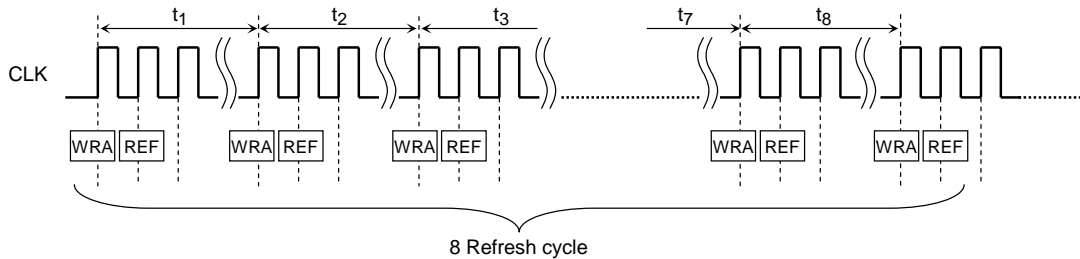

8 Refresh cycle

$$t_{REFI} = \frac{\text{Total time of 8 Refresh cycle}}{8} = \frac{t_1 + t_2 + t_3 + t_4 + t_5 + t_6 + t_7 + t_8}{8}$$

t_{REFI} is specified to avoid partly concentrated current of Refresh operation that is activated larger area than Read / Write operation.

Rev 1.1

2005-11-08   36/46

SELF-REFRESH ENTRY TIMING
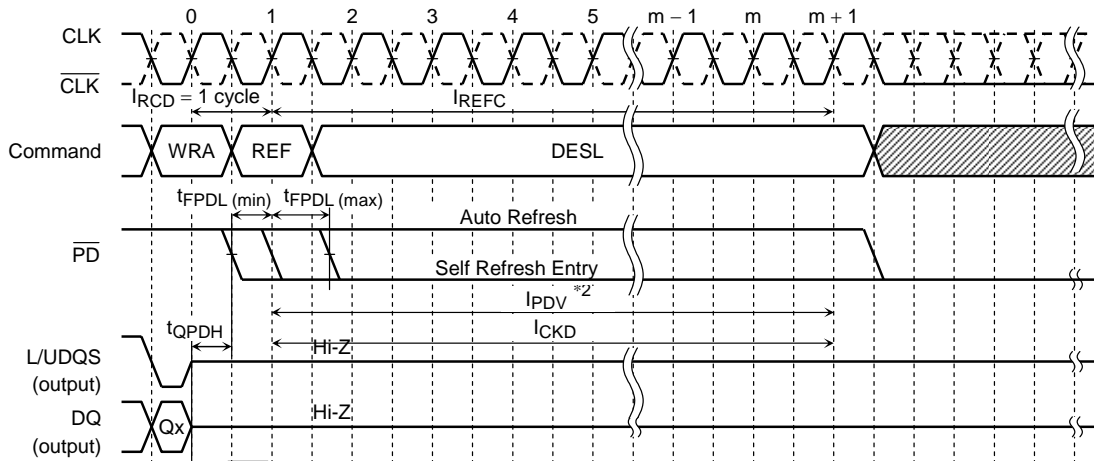

Notes: 1. ▨ is don't care.
2. $\overline{PD}$ must be brought to "Low" within the timing between t_{FPDL}(min) and t_{FPDL}(max) to Self Refresh mode. When $\overline{PD}$ is brought to "Low" after I_{PDV}, TC59LM913AMG perform Auto Refresh and enter Power down mode. In case of $\overline{PD}$ fall between t_{FPDL}(max) and I_{PDV}, TC59LM913AMG will either entry Self-Refresh mode or Power down mode after Auto-Refresh operation. It can't be specified which mode TC59LM913AMG operates.
3. It is desirable that clock input is continued at least I_{CKD} from REF command even though $\overline{PD}$ is brought to "Low" for Self-Refresh Entry.
4. In case of Self-Refresh entry after Write Operation, the delay time from the LAL command following WRA to the REF command is Write latency (WL)+3 clock cycles minimum.

SELF-REFRESH EXIT TIMING
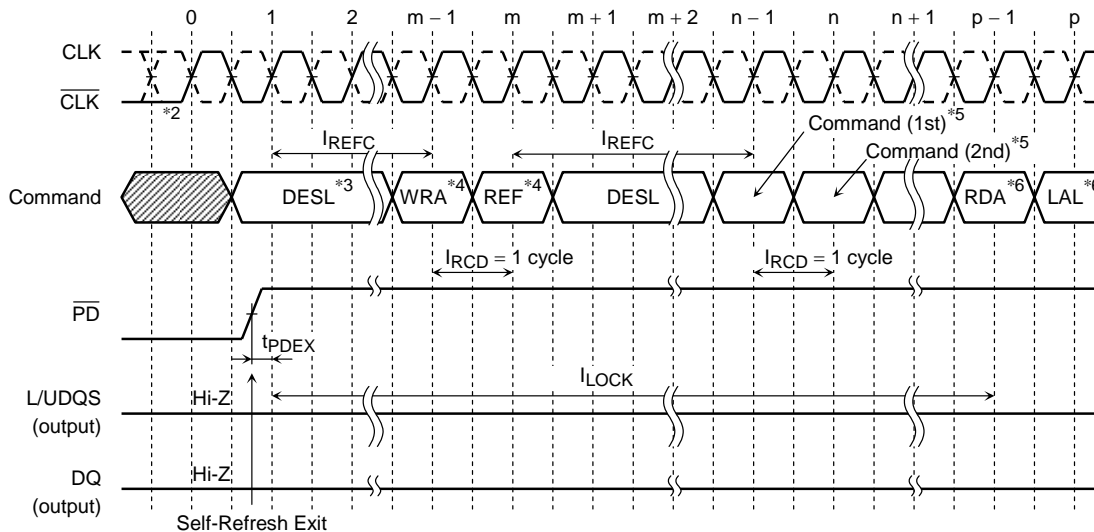

Notes: 1. ▨ is don't care.
2. Clock should be stable prior to $\overline{PD}$ = "High" if clock input is suspended in Self-Refresh mode.
3. DESL command must be asserted during I_{REFC} after $\overline{PD}$ is brought to "High".
4. It is desirable that one Auto-Refresh command is issued just after Self-Refresh Exit before any other operation.
5. Any command (except Read command) can be issued after I_{REFC}.
6. Read command (RDA + LAL) can be issued after I_{LOCK}.

Rev 1.1

FUNCTIONAL DESCRIPTION

Network FCRAM^{TM}

FCRAM^{TM} is an acronym of Fast Cycle Random Access Memory. The Network FCRAM^{TM} is competent to perform fast random core access, low latency and high-speed data transfer.

PIN FUNCTIONS

CLOCK INPUTS: CLK & $\overline{CLK}$

The CLK and $\overline{CLK}$ inputs are used as the reference for synchronous operation. CLK is master clock input. The $\overline{CS}$, FN and all address input signals are sampled on the crossing of the positive edge of CLK and the negative edge of $\overline{CLK}$. The L/UDQS and DQ output are aligned to the crossing point of CLK and $\overline{CLK}$. The timing reference point for the differential clock is when the CLK and $\overline{CLK}$ signals cross during a transition.

POWER DOWN: $\overline{PD}$

The PD input controls the entry to the Power Down or Self-Refresh modes. The $\overline{PD}$ input does not have a Clock Suspend function like a CKE input of a standard SDRAMs, therefore it is illegal to bring $\overline{PD}$ pin into low state if any Read or Write operation is being performed.

CHIP SELECT & FUNCTION CONTROL: $\overline{CS}$ & FN

The $\overline{CS}$ and FN inputs are a control signal for forming the operation commands on FCRAM^{TM}. Each operation mode is decided by the combination of the two consecutive operation commands using the $\overline{CS}$ and FN inputs.

BANK ADDRESSES: BA0~BA2

The BA0 to BA2 inputs are latched at the time of assertion of the RDA or WRA command and are selected the bank to be used for the operation. BA0 and BA1 also define which mode register is loaded during the Mode Register Set command (MRS or EMRS).

	BA0	BA1	BA2
Bank #0	0	0	0
Bank #1	1	0	0
Bank #2	0	1	0
Bank #3	1	1	0
Bank #4	0	0	1
Bank #5	1	0	1
Bank #6	0	1	1
Bank #7	1	1	1

Also, when BA2 input assign to A14 input, TC59LM913AMG can function as 4bank devices.

ADDRESS INPUTS: A0~A13

Address inputs are used to access the arbitrary address of the memory cell array within each bank. The Upper Addresses with Bank addresses are latched at the RDA or WRA command and the Lower Addresses are latched at the LAL command. The A0 to A13 inputs are also used for setting the data in the Regular or Extended Mode Register set cycle.

	UPPER ADDRESS	LOWER ADDRESS
8 bank operation	A0~A13	A0~A7
4 bank operation	A0~A13, BA2(A14)	A0~A7

Rev 1.1

DATA INPUT/OUTPUT: DQ0~DQ15

   The input data of DQ0 to DQ15 are taken in synchronizing with the both edges of L/UDQS input signal. The output data of DQ0 to DQ15 are outputted synchronizing with the both edges of L/UDQS signal.

DATA STROBE: LDQS / UDQS

   The L/UDQS is bi-directional signal. Both edges of L/UDQS are used as the reference of data input or output. In write operation, the L/UDQS used as an input signal is utilized for a latch of write data. In read operation, the L/UDQS is an output signal provides the read data strobe.

POWER SUPPLY: V$_{DD}$, V$_{DDQ}$, V$_{SS}$, V$_{SSQ}$

   V$_{DD}$ and V$_{SS}$ are power supply pins for memory core and peripheral circuits.
   V$_{DDQ}$ and V$_{SSQ}$ are power supply pins for the output buffer.

REFERENCE VOLTAGE: V$_{REF}$

   V$_{REF}$ is reference voltage for all input signals.

COMMAND FUNCTIONS and OPERATIONS

TC59LM913AMG are introduced the two consecutive command input method. Therefore, except for Power Down mode, each operation mode decided by the combination of the first command and the second command from stand-by states of the bank to be accessed.

Read Operation (1st command + 2nd command = RDA + LAL)

Issuing the RDA command with Bank Addresses and Upper Addresses to the idle bank puts the bank designated by Bank Address in a read mode. When the LAL command with Lower Addresses is issued at the next clock of the RDA command, the data is read out sequentially synchronizing with the both edges of L/UDQS output signal (Burst Read Operation). The initial valid read data appears after $\overline{CAS}$ latency from the issuing of the LAL command. The valid data is outputted for a burst length. The $\overline{CAS}$ latency, the burst length of read data and the burst type must be set in the Mode Register beforehand. The read operated bank goes back automatically to the idle state after l$_{RC}$.

Write Operation (1st command + 2nd command = WRA + LAL)

Issuing the WRA command with Bank Addresses and Upper Addresses to the idle bank puts the bank designated by Bank Address in a write mode. When the LAL command with Lower Addresses is issued at the next clock of the WRA command, the input data is latched sequentially synchronizing with the both edges of L/UDQS input signal (Burst Write Operation). The data and L/UDQS inputs have to be asserted in keeping with clock input after $\overline{CAS}$ latency-1 from the issuing of the LAL command. The L/UDQS has to be provided for a burst length. The $\overline{CAS}$ latency and the burst type must be set in the Mode Register beforehand. The write operated bank goes back automatically to the idle state after l$_{RC}$. Write Burst Length is controlled by VW0 and VW1 inputs with LAL command. See VW truth table.

Auto-Refresh Operation (1st command + 2nd command = WRA + REF)

TC59LM913AMG are required to refresh like a standard SDRAM. The Auto-Refresh operation is begun with the REF command following to the WRA command. The Auto-Refresh mode can be effective only when all banks are in the idle state. In a point to notice, the write mode started with the WRA command is canceled by the REF command having gone into the next clock of the WRA command instead of the LAL command. The minimum period between the Auto-Refresh command and the next command is specified by l$_{REFC}$. However, about a synthetic average interval of Auto-Refresh command, it must be careful. In case of equally distributed refresh, Auto-Refresh command has to be issued within once for every 3.9 μs by the maximum. In case of burst refresh or random distributed refresh, the average interval of eight consecutive Auto-Refresh commands has to be more than 400 ns always. In other words, the number of Auto-Refresh cycles that can be performed within 3.2 μs (8 $\times$ 400 ns) is to 8 times in the maximum.

Self-Refresh Operation (1st command + 2nd command = WRA + REF with $\overline{PD}$ = "L")

In case of Self-Refresh operation, refresh operation can be performed automatically by using an internal timer. When all banks are in the idle state and all outputs are in Hi-Z states, the TC59LM913AMG become Self-Refresh mode by issuing the Self-Refresh command. $\overline{PD}$ has to be brought to "Low" within t$_{FPDL}$ from the REF command following to the WRA command for a Self-Refresh mode entry. In order to satisfy the refresh period, the Self-Refresh entry command should be asserted within 3.9 μs after the latest Auto-Refresh command. Once the device enters Self-Refresh mode, the DESL command must be continued for l$_{REFC}$ period. In addition, it is desirable that clock input is kept in l$_{CKD}$ period. The device is in Self-Refresh mode as long as $\overline{PD}$ held "Low". During Self-Refresh mode, all input and output buffers are disabled except for $\overline{PD}$, therefore the power dissipation lowers. Regarding a Self-Refresh mode exit, $\overline{PD}$ has to be changed over from "Low" to "High" along with the DESL command, and the DESL command has to be continuously issued in the number of clocks specified by l$_{REFC}$. The Self-Refresh exit function is asynchronous operation. It is required that one Auto-Refresh command is issued to avoid the violation of the refresh period just after l$_{REFC}$ from Self-Refresh exit.

Power Down Mode ($\overline{PD}$ = "L")

When all banks are in the idle state and DQ outputs are in Hi-Z states, the TC59LM913AMG become Power Down Mode by asserting $\overline{PD}$ is "Low". When the device enters the Power Down Mode, all input and output buffers are disabled after specified time except for $\overline{PD}$. Therefore, the power dissipation lowers. To exit the Power Down Mode, $\overline{PD}$ has to be brought to "High" and the DESL command has to be issued for two clocks cycle after $\overline{PD}$ goes high. The Power Down exit function is asynchronous operation.

Rev 1.1

Mode Register Set (MRS) and Extended Mode Register Set (EMRS)
(1st command + 2nd command = RDA + MRS)

   When all banks are in the idle state, issuing the MRS command following to the RDA command can program the Mode Register. In a point to notice, the read mode started with the RDA command is canceled by the MRS command having gone into the next clock of the RDA command instead of the LAL command. The data to be set in the Mode Register is transferred using A0 to A14, BA0 to BA1 address inputs. The TC59LM913AMG have two mode registers. These are Regular and Extended Mode Register. The Regular or Extended Mode Register is chosen by BA0 and BA1 in the MRS command. The Regular Mode Register designates the operation mode for a read or write cycle. The Regular Mode Register has four function fields.

The four fields are as follows:
   (R-1) Burst Length field to set the length of burst data
   (R-2) Burst Type field to designate the lower address access sequence in a burst cycle
   (R-3) $\overline{CAS}$ Latency field to set the access time in clock cycle
   (R-4) Test Mode field to use for supplier only.

The Extended Mode Register has two function fields. The two fields are as follows:
   (E-1) DLL Switch field to choose either DLL enable or DLL disable
   (E-2) Output Driver Impedance Control field.

   Once those fields in the Mode Register are set up, the register contents are maintained until the Mode Register is set up again by another MRS command or power supply is lost. The initial value of the Regular or Extended Mode Register after power-up is undefined, therefore the Mode Register Set command must be issued before proper operation.

- Regular Mode Register/Extended Mode Register change bits (BA0, BA1).
   These bits are used to choose either Regular MRS or Extended MRS

BA1	BA0	Mode Register Set
0	0	Regular MRS
0	1	Extended MRS
1	×	Reserved

Regular Mode Register Fields

   (R-1) Burst Length field (A2 to A0)
      This field specifies the data length for column access using the A2 to A0 pins and sets the Burst Length to be 2 or 4 words.

| A2	A1	A0	BURST LENGTH
0	0	0	Reserved
0	0	1	2 words
0	1	0	4 words
0	1	1	Reserved
1	×	×	Reserved

   (R-2) Burst Type field (A3)
      The Burst Type can be chosen Interleave mode or Sequential mode. When the A3 bit is "0", Sequential mode is selected. When the A3 bit is "1", Interleave mode is selected. Both burst types support burst length of 2 and 4 words.

A3	BURST TYPE
0	Sequential
1	Interleave

Rev 1.1

- **Addressing sequence of Sequential mode (A3)**

  A column access is started from the inputted lower address and is performed by incrementing the lower address input to the device.

$\overline{CAS}$ Latency = 4
Addressing sequence for Sequential mode

DATA	ACCESS ADDRESS	BURST LENGTH
Data 0	N	2 words (address bits is LA0) not carried from LA0~LA1
Data 1	n + 1	
Data 2	n + 2	4 words (address bits is LA1, LA0) not carried from LA1~LA2
Data 3	n + 3	

- **Addressing sequence of Interleave mode**

  A column access is started from the inputted lower address and is performed by interleaving the address bits in the sequence shown as the following.

Addressing sequence for Interleave mode

DATA	ACCESS ADDRESS		BURST LENGTH
Data 0	···A8 A7 A6 A5 A4 A3 A2 A1 A0		2 words
Data 1	···A8 A7 A6 A5 A4 A3 A2 A1 $\overline{A0}$		
Data 2	···A8 A7 A6 A5 A4 A3 A2 $\overline{A1}$ A0		4 words
Data 3	···A8 A7 A6 A5 A4 A3 A2 $\overline{A1}$ $\overline{A0}$		

(R-3) $\overline{CAS}$ **Latency field (A6 to A4)**

This field specifies the number of clock cycles from the assertion of the LAL command following the RDA command to the first data read. The minimum values of $\overline{CAS}$ Latency depends on the frequency of CLK. In a write mode, the place of clock that should input write data is $\overline{CAS}$ Latency cycles − 1.

A6	A5	A4	$\overline{CAS}$ LATENCY
0	0	0	Reserved
0	0	1	Reserved
0	1	0	Reserved
0	1	1	Reserved
1	0	0	4
1	0	1	Reserved
1	1	0	Reserved
1	1	1	Reserved

(R-4) **Test Mode field (A7)**

This bit is used to enter Test Mode for supplier only and must be set to "0" for normal operation.

(R-5) **Reserved field in the Regular Mode Register**

- **Reserved bits (A8 to A13, BA2)**

  These bits are reserved for future operations. They must be set to "0" for normal operation.

Rev 1.1

<u>Extended Mode Register fields</u>

(E-1) DLL Switch field (A0)
    This bit is used to enable DLL. When the A0 bit is set "0", DLL is enabled. This bit must be set to "0" for normal operation.

(E-2) Output Driver Impedance Control field (A1, A6)
    This field is used to choose Output Driver Strength. Four types of Driver Strength are supported.
A6	A1	OUTPUT DRIVER IMPEDANCE CONTROL
0	0	Normal Output Driver
0	1	Strong Output Driver
1	0	Weaker Output Driver
1	1	Weakest Output Driver

(E-3) Reserved field (A2 to A5, A7 to A13, BA2)
    These bits are reserved for future operations and must be set to "0" for normal operation.

PACKAGE DIMENSIONS

P-BGA64-1317-1.00AZ

Note: In order to support a package, four outer balls located on F and K row are required to assembly to board. These four ball is not connected to any electrical level.

Weight: 0.23g (typ.)

RESTRICTIONS ON PRODUCT USE

- The information contained herein is subject to change without notice.

- The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA for any infringements of patents or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of TOSHIBA or others.

- TOSHIBA is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such TOSHIBA products could cause loss of human life, bodily injury or damage to property.
  In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent TOSHIBA products specifications. Also, please keep in mind the precautions and conditions set forth in the "Handling Guide for Semiconductor Devices," or "TOSHIBA Semiconductor Reliability Handbook" etc..

- The TOSHIBA products listed in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.). These TOSHIBA products are neither intended nor warranted for usage in equipment that requires extraordinarily high quality and/or reliability or a malfunction or failure of which may cause loss of human life or bodily injury ("Unintended Usage"). Unintended Usage include atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, medical instruments, all types of safety devices, etc.. Unintended Usage of TOSHIBA products listed in this document shall be made at the customer's own risk.

- The products described in this document are subject to the foreign exchange and foreign trade laws.

- TOSHIBA products should not be embedded to the downstream products which are prohibited to be produced and sold, under any law and regulations.
