

ProASIC3L Low-Power Flash FPGAs with Flash*Freeze Technology

Features and Benefits

Low Power

- Dramatic Reduction in Dynamic and Static Power Savings
- 1.2 V to 1.5 V Core and I/O Voltage Support for Low Power
- Low Power Consumption in Flash*Freeze™ Mode Allows for Instantaneous Entry to / Exit from Low-Power Flash*Freeze Mode
- Supports Single-Voltage System Operation
- Low-Impedance Switches

High Capacity

- 250 k to 3 M System Gates
- Up to 504 kbits of True Dual-Port SRAM
- Up to 620 User I/Os

Reprogrammable Flash Technology

- 130-nm, 7-Layer Metal (6 Copper), Flash-Based CMOS Process
- Live-at-Power-Up (LAPU) Level 0 Support
- Single-Chip Solution
- Retains Programmed Design when Powered Off

High Performance

- 350 MHz (1.5 V systems) and 250 MHz (1.2 V systems) System Performance
- 3.3 V, 66 MHz, 66-Bit PCI (1.5 V systems) and 66 MHz, 32-Bit PCI (1.2 V systems)

In-System Programming (ISP) and Security

- Secure ISP Using On-Chip 128-Bit Advanced Encryption Standard (AES) Decryption via JTAG (IEEE 1532-compliant)
- FlashLock[®] to Secure FPGA Contents

High-Performance Routing Hierarchy

- Segmented, Hierarchical Routing and Clock Structure
- High-Performance, Low-Skew Global Network
- Architecture Supports Ultra-High Utilization

Advanced and Pro (Professional) I/Os

- 700 Mbps DDR, LVDS-Capable I/Os
- 1.2 V, 1.5 V, 1.8 V, 2.5 V, and 3.3 V Mixed-Voltage Operation

- Bank-Selectable I/O Voltages—up to 8 Banks per Chip
- Single-Ended I/O Standards: LVTTTL, LVCMOS 3.3 V / 2.5 V / 1.8 V / 1.5 V / 1.2 V, 3.3 V PCI / 3.3 V PCI-X, and LVCMOS 2.5 V / 5.0 V Input
- Differential I/O Standards: LVPECL, LVDS, BLVDS, and M-LVDS
- Voltage-Referenced I/O Standards: GTL+ 2.5 V / 3.3 V, GTL 2.5 V / 3.3 V, HSTL Class I and II, SSTL2 Class I and II, SSTL3 Class I and II (A3PE3000L only)
- I/O Registers on Input, Output, and Enable Paths
- Hot-Swappable and Cold-Sparing I/Os Programmable Output Slew Rate and Drive Strength
- Programmable Input Delay (A3PE3000L only)
- Schmitt Trigger Option on Single-Ended Inputs (A3PE3000L)
- Weak Pull-Up/-Down
- IEEE 1149.1 (JTAG) Boundary Scan Test
- Pin-Compatible Packages across the ProASIC[®]3L Family (except PQ208)

Clock Conditioning Circuit (CCC) and PLL

- Six CCC Blocks, One with Integrated PLL (ProASIC3L) and All with Integrated PLL (ProASIC3EL)
- Configurable Phase Shift, Multiply/Divide, Delay Capabilities, and External Feedback
- Wide Input Frequency Range 1.5 MHz to 250 MHz (1.2 V systems) and 350 MHz (1.5 V systems)

SRAMs and FIFOs

- Variable-Aspect-Ratio 4,608-Bit RAM Blocks (x1, x2, x4, x9, and x18 organizations available)
- True Dual-Port SRAM (except x18)
- 24 SRAM and FIFO Configurations with Synchronous Operation:
 - 250 MHz: For 1.2 V systems
 - 350 MHz: For 1.5 V systems

ARM[®] Processor Support in ProASIC3L FPGAs

- ARM Cortex™-M1 Soft Processor Available with or without Debug

Table 1-1 • ProASIC3 Low-Power Product Family

ProASIC3L Devices	A3P250L	A3P600L	A3P1000L	A3PE3000L

Notes:

1. Refer to the Cortex-M1 product brief for more information.
2. AES is not available for ARM-enabled ProASIC3L devices.
3. For the A3PE3000L, the PQ208 package has six CCCs and two PLLs.

I/Os Per Package¹

ProASIC3L Low-Power Devices	A3P250L ³		A3P600L		A3P1000L		A3PE3000L	
ARM Cortex-M1 Devices			M1A3P600L		M1A3P1000L		M1A3PE3000L	
Package	I/O Type							
	Single-Ended I/O ²	Differential I/O Pairs	Single-Ended I/O ²	Differential I/O Pairs	Single-Ended I/O ²	Differential I/O Pairs	Single-Ended I/O ²	Differential I/O Pairs
VQ100	68	13		–	–	–	–	–
PQ208	151	34	154	35	154	35	147	65
FG144	97	24	97	25	97	25		
FG256	157	38	177	43	177	44	–	–
FG324	–	–	–	–	–	–	221	110
FG484	–	–	235	60	300	74	341	168
FG896	–	–	–	–	–	–	620	300

Notes:

- When considering migrating your design to a lower- or higher-density device, refer to the packaging section of the datasheet to ensure you are complying with design and board migration requirements.
- Each used differential I/O pair reduces the number of single-ended I/Os available by two.
- For A3P250L devices, the maximum number of LVPECL pairs in east and west banks cannot exceed 15.
- FG256 and FG484 are footprint-compatible packages.
- "G" indicates RoHS-compliant packages. Refer to "ProASIC3L Ordering Information" on page III for the location of the "G" in the part number.
- For A3PE3000L devices, the usage of certain I/O standards is limited as follows:
 - SSTL3(I) and (II): up to 40 I/Os per north or south bank
 - LVPECL / GTL+ 3.3 V / GTL 3.3 V: up to 48 I/Os per north or south bank
 - SSTL2(I) and (II) / GTL+ 2.5 V / GTL 2.5 V: up to 72 I/Os per north or south bank
- When the Flash*Freeze pin is used to directly enable Flash*Freeze mode and not as a regular I/O, the number of single-ended user I/Os available is reduced by one.

ProASIC3L Ordering Information

ProASIC3L Devices

A3P250L = 250,000 System Gates
 A3P600L = 600,000 System Gates
 A3P1000L = 1,000,000 System Gates
 A3PE3000L = 3,000,000 System Gates

ProASIC3L Devices with Cortex-M1

M1A3P600L = 600,000 System Gates
 M1A3P1000L = 1,000,000 System Gates
 M1A3PE3000L = 3,000,000 System Gates

Temperature Grade Offerings

1 – ProASIC3L Device Family Overview

General Description

The ProASIC3L family of Actel flash FPGAs dramatically reduces dynamic power consumption by 40% and static power by 50%. These power savings are coupled with performance, density, true single-chip, 1.2 V to 1.5 V core and I/O operation as low as 1.2 V, reprogrammability, and advanced features.

Using Actel's proven Flash*Freeze technology enables users to shut off dynamic power instantaneously and switch the device to static mode without the need to switch off clocks or power supplies while retaining internal states of the device. This greatly simplifies power management on a board done through I/Os and clocks. In addition, optimized software tools using power-driven layout provide instant push-button power reduction.

Nonvolatile flash technology gives ProASIC3L devices the advantage of being a secure, low-power, single-chip solution that is live at power-up (LAPU). ProASIC3L offers dramatic dynamic power savings giving the FPGA users flexibility to combine low power with high performance.

These features enable designers to create high-density systems using existing ASIC or FPGA design flows and tools.

ProASIC3L devices offer 1 kbit of on-chip, reprogrammable, nonvolatile FlashROM storage as well as clock conditioning circuitry (CCC) based on an integrated phase-locked loop (PLL). ProASIC3L devices support devices from 250 k system gates to 3 million system gates with up to 504 kbits of true dual-port SRAM and 620 user I/Os.

M1 ProASIC3L devices support the high-performance, 32-bit Cortex-M1 processor developed by ARM for implementation in FPGAs. ARM Cortex-M1 is a soft processor that is fully implemented in the FPGA fabric. It has a three-stage pipeline that offers a good balance between low-power consumption and speed when implemented in an M1 ProASIC3L device. The processor runs the ARMv6-M instruction set, has a configurable nested interrupt controller, and can be implemented with or without the debug block. ARM Cortex-M1 is available for free from Actel for use in M1 ProASIC3L FPGAs.

The ARM-enabled devices have Actel ordering numbers that begin with M1 and do not support AES decryption.

Flash*Freeze Technology

The ProASIC3L devices offer Actel's proven Flash*Freeze technology, which allows instantaneous switching from an active state to a static state. ProASIC3L devices do not need additional components to turn off I/Os or clocks while retaining the design information, SRAM content, and registers. Flash*Freeze technology is combined with in-system programmability, which enables users to quickly and easily upgrade and update their designs in the final stages of manufacturing or in the field. The ability of ProASIC3L devices to support a wide range core voltage (1.2 V to 1.5 V) allows for an even greater reduction in power consumption, which enables low total system power.

When the ProASIC3L device enters Flash*Freeze mode, the device automatically shuts off the clocks and inputs to the FPGA core; when the device exits Flash*Freeze mode, all activity resumes and data is retained.

The availability of low-power modes, combined with a reprogrammable, single-chip, single-voltage solution, make ProASIC3L devices suitable for low-power data transfer and manipulation in portable media, secure communications, radio applications as well as high performance portable, industrial, test, scientific, and medical applications.

Flash Advantages

Low Power

The ProASIC3L family of Actel flash-based FPGAs provide a low-power advantage, and when coupled with high performance, enables designers to make power-smart choices using a single-chip, reprogrammable, and live-at-power-up device.

ProASIC3L devices offer 40% dynamic power and 50% static power savings by reducing the core operating voltage to 1.2 V. In addition, the Power Driven Layout (PDL) feature in Libero® Integrated Design Environment (IDE) offers up to 30% additional power reduction. With Flash*Freeze technology, ProASIC3L is able to retain device SRAM and logic while dynamic power is reduced to a minimum, without the need to stop clock or power supplies. Combining these features provides a low-power, feature-rich and high-performance solution.

Security

Nonvolatile, flash-based ProASIC3L devices do not require a boot PROM, so there is no vulnerable external bitstream that can be easily copied. ProASIC3L devices incorporate FlashLock, which provides a unique combination of reprogrammability and design security without external overhead, advantages that only an FPGA with nonvolatile flash programming can offer.

ProASIC3L devices utilize a 128-bit flash-based lock and a separate AES key to secure programmed intellectual property and configuration data. In addition, all FlashROM data in ProASIC3L devices can be encrypted prior to loading, using the industry-leading AES-128 (FIPS192) bit block cipher encryption standard. AES was adopted by the National Institute of Standards and Technology (NIST) in 2000 and replaces the 1977 DES standard. ProASIC3L devices have a built-in AES decryption engine and a flash-based AES key that make them the most comprehensive programmable logic device security solution available today. ProASIC3L devices with AES-based security allow for secure, remote field updates over public networks such as the Internet, and ensure that valuable IP remains out of the hands of system overbuilders, system cloners, and IP thieves. The contents of a programmed device cannot be read back, although secure design verification is possible.

Security, built into the FPGA fabric, is an inherent component of the ProASIC3L family. The flash cells are located beneath seven metal layers, and many device design and layout techniques have been used to make invasive attacks extremely difficult. The ProASIC3L family, with FlashLock and AES security, is unique in being highly resistant to both invasive and noninvasive attacks. Your valuable IP is protected and secure, making remote ISP possible. A ProASIC3L device provides the most impenetrable security for programmable logic designs.

Single Chip

Flash-based FPGAs store their configuration information in on-chip flash cells. Once programmed, the configuration data is an inherent part of the FPGA structure, and no external configuration data needs to be loaded at system power-up (unlike SRAM-based FPGAs). Therefore, flash-based ProASIC3L FPGAs do not require system configuration components such as EEPROMs or microcontrollers to load device configuration data. This reduces bill-of-materials costs and PCB area, and increases security and system reliability.

Live at Power-Up

The Actel flash-based ProASIC3L devices support Level 0 of the LAPU classification standard. This feature helps in system component initialization, execution of critical tasks before the processor wakes up, setup and configuration of memory blocks, clock generation, and bus activity management. The LAPU feature of flash-based ProASIC3L devices greatly simplifies total system design and reduces total system cost, often eliminating the need for CPLDs and clock generation PLLs. In addition, glitches and brownouts in system power will not corrupt the ProASIC3L device's flash configuration, and unlike SRAM-based FPGAs, the device will not have to be reloaded when system power is restored. This enables the reduction or complete removal of the configuration PROM, expensive voltage monitor, brownout detection, and clock generator devices from the PCB design. Flash-based ProASIC3L devices simplify total system design and reduce cost and design risk while increasing system reliability and improving system initialization time.

Reduced Cost of Ownership

Advantages to the designer extend beyond low unit cost, performance, and ease of use. Unlike SRAM-based FPGAs, flash-based ProASIC3L devices allow all functionality to be live at power-up; no external boot PROM is required. On-board security mechanisms prevent access to all the programming information and enable secure remote updates of the FPGA logic. Designers can perform secure remote in-system reprogramming to support future design iterations and field upgrades with confidence that valuable intellectual property cannot be compromised or copied. Secure ISP can be performed using the industry-standard AES algorithm. The ProASIC3L family device architecture mitigates the need for ASIC migration at higher user volumes. This makes the ProASIC3L family a cost-effective ASIC replacement solution, manipulation in portable media and secure communications, radio applications as well as high performance portable Industrial, test, scientific and medical applications.

Firm-Error Immunity

Firm errors occur most commonly when high-energy neutrons, generated in the upper atmosphere, strike a configuration cell of an SRAM FPGA. The energy of the collision can change the state of the configuration cell and thus change the logic, routing, or I/O behavior in an unpredictable way. These errors are impossible to prevent in SRAM FPGAs. The consequence of this type of error can be a complete system failure. Firm errors do not exist in the configuration memory of ProASIC3L flash-based FPGAs. Once it is programmed, the flash cell configuration element of ProASIC3L FPGAs cannot be altered by high-energy neutrons and is therefore immune to them. Recoverable (or soft) errors occur in the user data SRAM of all FPGA devices. These can easily be mitigated by using error detection and correction (EDAC) circuitry built into the FPGA fabric.

Advanced Flash Technology

The ProASIC3L family offers many benefits, including nonvolatility and reprogrammability, through an advanced flash-based, 130-nm LVCMOS process with 7 layers of metal. Standard CMOS design techniques are used to implement logic and control functions. The combination of fine granularity, enhanced flexible routing resources, and abundant flash switches allows for very high logic utilization without compromising device routability or performance. Logic functions within the device are interconnected through a four-level routing hierarchy.

Advanced Architecture

The proprietary ProASIC3L architecture provides granularity comparable to standard-cell ASICs. The ProASIC3L device consists of five distinct and programmable architectural features (Figure 1-1 on page 1-4 and Figure 1-2 on page 1-4):

- FPGA VersaTiles
- Dedicated FlashROM
- Dedicated SRAM/FIFO memory
- Extensive CCCs and PLLs
- I/O structure

The FPGA core consists of a sea of VersaTiles. Each VersaTile can be configured as a three-input logic function, a D-flip-flop (with or without enable), or a latch by programming the appropriate flash switch interconnections. The versatility of the ProASIC3L core tile, as either a three-input lookup table (LUT) equivalent or a D-flip-flop/latch with enable, allows for efficient use of the FPGA fabric. The VersaTile capability is unique to the Actel ProASIC family of third-generation-architecture flash FPGAs. VersaTiles are connected with any of the four levels of routing hierarchy. Flash switches are distributed throughout the device to provide nonvolatile, reconfigurable interconnect programming. Maximum core utilization is possible for virtually any design.

In addition, extensive on-chip programming circuitry allows for rapid, single-voltage (3.3 V) programming of ProASIC3L devices via an IEEE 1532 JTAG interface.

Figure 1-1 • ProASIC3L Device Architecture Overview with Four I/O Banks (A3P250L, A3P600L, and A3P1000L)

Figure 1-2 • ProASIC3EL Device Architecture Overview

Flash*Freeze Technology

The ProASIC3L devices offer Actel's proven Flash*Freeze technology, which enables designers to instantaneously shut off dynamic power consumption while retaining all SRAM and register information. Flash*Freeze technology enables the user to quickly (within 1 μ s) enter and exit Flash*Freeze mode by activating the Flash*Freeze (FF) pin while all power supplies are kept at their original values. In addition, I/Os and global I/Os can still be driven and can be toggling without impact on power consumption; clocks can still be driven or can be toggling without impact on power consumption; and the device retains all core registers, SRAM information, and states. I/O states are tristated during Flash*Freeze mode or can be set to a certain state using weak pull-up or pull-down I/O attribute configuration. No power is consumed by the I/O banks, clocks, JTAG pins, or PLL. Flash*Freeze technology allows the user to switch to active mode on demand, thus simplifying the power management of the device.

The FF pin (active low) can be routed internally to the core to allow the user's logic to decide when it is safe to transition to this mode. It is also possible to use the FF pin as a regular I/O if Flash*Freeze mode usage is not planned, which is advantageous because of the inherent low-power static and dynamic capabilities of the ProASIC3L device. Refer to [Figure 1-3](#) for an illustration of entering/exiting Flash*Freeze mode.

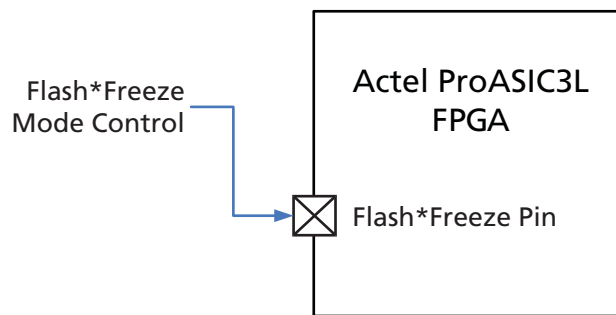

Figure 1-3 • ProASIC3L Flash*Freeze Mode

VersaTiles

The ProASIC3L core consists of VersaTiles, which have been enhanced beyond the ProASIC^{PLUS}® core tiles. The ProASIC3L VersaTile supports the following:

- All 3-input logic functions—LUT-3 equivalent
- Latch with clear or set
- D-flip-flop with clear or set
- Enable D-flip-flop with clear or set

Refer to [Figure 1-4](#) for VersaTile configurations.

Figure 1-4 • VersaTile Configurations

User Nonvolatile FlashROM

Actel ProASIC3L devices have 1 kbit of on-chip, user-accessible, nonvolatile FlashROM. The FlashROM can be used in diverse system applications:

- Internet Protocol addressing (wireless or fixed)
- System calibration settings
- Device serialization and/or inventory control
- Subscription-based business models (for example, set-top boxes)
- Secure key storage for secure communications algorithms
- Asset management/tracking
- Date stamping
- Version management

The FlashROM is written using the standard ProASIC3L IEEE 1532 JTAG programming interface. The core can be individually programmed (erased and written), and on-chip AES decryption can be used selectively to securely load data over public networks, as in security keys stored in the FlashROM for a user design.

The FlashROM can be programmed via the JTAG programming interface, and its contents can be read back either through the JTAG programming interface or via direct FPGA core addressing. Note that the FlashROM can only be programmed from the JTAG interface and cannot be programmed from the internal logic array.

The FlashROM is programmed as 8 banks of 128 bits; however, reading is performed on a byte-by-byte basis using a synchronous interface. A 7-bit address from the FPGA core defines which of the 8 banks and which of the 16 bytes within that bank are being read. The three most significant bits (MSBs) of the FlashROM address determine the bank, and the four least significant bits (LSBs) of the FlashROM address define the byte.

The Actel ProASIC3L development software solutions, Libero IDE and Designer, have extensive support for the FlashROM. One such feature is auto-generation of sequential programming files for applications requiring a unique serial number in each part. Another feature allows the inclusion of static data for system version control. Data for the FlashROM can be generated quickly and easily using Actel Libero IDE and Designer software tools. Comprehensive programming file support is also included to allow for easy programming of large numbers of parts with differing FlashROM contents.

SRAM and FIFO

ProASIC3L devices have embedded SRAM blocks along their north and south sides. Each variable-aspect-ratio SRAM block is 4,608 bits in size. Available memory configurations are 256×18, 512×9, 1k×4, 2k×2, and 4k×1 bits. The individual blocks have independent read and write ports that can be configured with different bit widths on each port. For example, data can be sent through a 4-bit port and read as a single bitstream. The embedded SRAM blocks can be initialized via the device JTAG port (ROM emulation mode) using the UJTAG macro.

In addition, every SRAM block has an embedded FIFO control unit. The control unit allows the SRAM block to be configured as a synchronous FIFO without using additional core VersaTiles. The FIFO width and depth are programmable. The FIFO also features programmable Almost Empty (AEMPTY) and Almost Full (AFULL) flags in addition to the normal Empty and Full flags. The embedded FIFO control unit contains the counters necessary for generation of the read and write address pointers. The embedded SRAM/FIFO blocks can be cascaded to create larger configurations.

PLL and CCC

ProASIC3L devices provide designers with flexible clock conditioning circuit (CCC) capabilities. Each member of the ProASIC3L family contains six CCCs. One CCC (center west side) has a PLL.

The six CCC blocks are located at the four corners and the centers of the east and west sides. One CCC (center west side) has a PLL.

All six CCC blocks are usable; the four corner CCCs and the east CCC allow simple clock delay operations as well as clock spine access.

The inputs of the six CCC blocks are accessible from the FPGA core or from one of several inputs located near the CCC that have dedicated connections to the CCC block.

The CCC block has these key features:

- Wide input frequency range (f_{IN_CCC}) = 1.5 MHz up to 250 MHz
- Output frequency range (f_{OUT_CCC}) = 0.75 MHz up to 250 MHz
- 2 programmable delay types for clock skew minimization
- Clock frequency synthesis

Additional CCC specifications:

- Internal phase shift = 0°, 90°, 180°, and 270°. Output phase shift depends on the output divider configuration.
- Output duty cycle = 50% ± 1.5% or better
- Low output jitter: worst case < 2.5% × clock period peak-to-peak period jitter when single global network used
- Maximum acquisition time is 300 μs
- Exceptional tolerance to input period jitter— allowable input jitter is up to 1.5 ns
- Four precise phases; maximum misalignment between adjacent phases of $40 \text{ ps} \times 250 \text{ MHz} / f_{OUT_CCC}$

Global Clocking

ProASIC3L devices have extensive support for multiple clocking domains. In addition to the CCC and PLL support described above, there is a comprehensive global clock distribution network.

Each VersaTile input and output port has access to nine VersaNets: six chip (main) and three quadrant global networks. The VersaNets can be driven by the CCC or directly accessed from the core via multiplexers (MUXes). The VersaNets can be used to distribute low-skew clock signals or for rapid distribution of high-fanout nets.

I/Os with Advanced I/O Standards

The ProASIC3L family of FPGAs features a flexible I/O structure, supporting a range of voltages (1.2 V, 1.5 V, 1.8 V, 2.5 V, and 3.3 V). ProASIC3L FPGAs support different I/O standards, including single-ended, differential, and voltage-referenced (ProASIC3EL only). The I/Os are organized into banks, with two, four, or eight (ProASIC3EL only) banks per device. The configuration of these banks determines the I/O standards supported. For ProASIC3EL, each I/O bank is subdivided into V_{REF} minibanks, which are used by voltage-referenced I/Os. V_{REF} minibanks contain 8 to 18 I/Os. All the I/Os in a given minibank share a common V_{REF} line. Therefore, if any I/O in a given V_{REF} minibank is configured as a V_{REF} pin, the remaining I/Os in that minibank will be able to use that reference voltage.

Each I/O module contains several input, output, and enable registers. These registers allow the implementation of the following:

- Single-data-rate applications (e.g., PCI 66 MHz, bidirectional SSTL 2 and 3, Class I and II)
- Double-data-Rate applications (e.g., DDR LVDS, BLVDS, and M-LVDS I/Os for point-to-point communications, and DDR 200 MHz SRAM using bidirectional HSTL Class II).

ProASIC3L banks support LVPECL, LVDS, BLVDS, and M-LVDS. BLVDS and M-LVDS can support up to 20 loads.

Part Number and Revision Date

Part Number 51700100-001-2

Revised July 2008

List of Changes

The following table lists critical changes that were made in the current version of the document.

Previous Version	Changes in Current Version (v1.1)	Page
v1.0 (April 2008)	As a result of the Libero IDE v8.4 release, Actel now offers a wide range of core voltage support. The document was updated to change 1.2 V / 1.5 V to 1.2 V to 1.5 V.	N/A
51700100-001-1 (April 2008)	This document was divided into two sections and given a version number, starting at v1.0. The first section of the document includes features, benefits, ordering information, and temperature and speed grade offerings. The second section is a device family overview.	N/A
51700100-001-0 (January 2008)	Reference to M1A3P250L was removed from Table 1-1 · ProASIC3 Low-Power Product Family , the "I/Os Per Package1" table, the "ProASIC3L Ordering Information" section, and the "Temperature Grade Offerings" table. The table note regarding M1A3P250L was removed from the "I/Os Per Package1" table.	I, II, III, IV

2 – ProASIC3L DC and Switching Characteristics

General Specifications

Operating Conditions

Stresses beyond those listed in [Table 2-1](#) may cause permanent damage to the device.

Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Absolute Maximum Ratings are stress ratings only; functional operation of the device at these or any other conditions beyond those listed under the Recommended Operating Conditions specified in [Table 2-2 on page 2-2](#) is not implied.

Table 2-1 • Absolute Maximum Ratings

Symbol	Parameter	Limits	Units
V_{CC}	DC core supply voltage	-0.3 to 1.65	V
V_{JTAG}	JTAG DC voltage	-0.3 to 3.75	V
V_{PUMP}	Programming voltage	-0.3 to 3.75	V
V_{CCPLL}	Analog power supply (PLL)	-0.3 to 1.65	V
V_{CCI} and VMV^3	DC I/O buffer supply voltage	-0.3 to 3.75	V
V_I	I/O input voltage	-0.3 V to 3.6 V (when I/O hot insertion mode is enabled) -0.3 V to ($V_{CCI} + 1$ V) or 3.6 V, whichever voltage is lower (when I/O hot-insertion mode is disabled)	V
T_{STG}^2	Storage temperature	-65 to +150	°C
T_J^2	Junction temperature	+125	°C

Notes:

1. The device should be operated within the limits specified by the datasheet. During transitions, the input signal may undershoot or overshoot according to the limits shown in [Table 2-4 on page 2-3](#).
2. For flash programming and retention maximum limits, refer to [Table 2-3 on page 2-2](#), and for recommended operating limits, refer to [Table 2-2 on page 2-2](#).
3. VMV pins must be connected to the corresponding V_{CCI} pins. See [Pin Descriptions](#) for further information.

Table 2-2 • Recommended Operating Conditions ¹

Symbol	Parameter		Commercial	Industrial	Units
T _A	Ambient temperature		0 to +70	-40 to +85	°C
T _J	Junction Temperature		0 to +85	-40 to +100	°C
V _{CC} ²	1.2 V–1.5 V wide range core voltage ³		1.14 to 1.575	1.14 to 1.575	V
V _{JTAG}	JTAG DC voltage		1.4 to 3.6	1.4 to 3.6	V
V _{PUMP} ⁴	Programming voltage	Programming Mode	3.15 to 3.45	3.15 to 3.45	V
		Operation ⁴	0 to 3.45	0 to 3.45	V
V _{CCPLL} ⁷	Analog power supply (PLL)	1.2 V–1.5 V wide range core voltage	1.14 to 1.575	1.14 to 1.575	V
V _{CCI} and VMV ⁶	1.2 V DC supply voltage ⁵		1.14 to 1.26	1.14 to 1.26	V
	1.5 V DC supply voltage		1.425 to 1.575	1.425 to 1.575	V
	1.8 V DC supply voltage		1.7 to 1.9	1.7 to 1.9	V
	2.5 V DC supply voltage		2.3 to 2.7	2.3 to 2.7	V
	3.3 V DC supply voltage		3.0 to 3.6	3.0 to 3.6	V
	LVDS differential I/O		2.375 to 2.625	2.375 to 2.625	V
	LVPECL differential I/O		3.0 to 3.6	3.0 to 3.6	V

Notes:

1. All parameters representing voltages are measured with respect to GND unless otherwise specified.
2. The ranges given here are for power supplies only. The recommended input voltage ranges specific to each I/O standard are given in [Table 2-13 on page 2-10](#). V_{CCI} should be at the same voltage within a given I/O bank.
3. 1.5 V data will be released at a later date. Please check www.actel.com for the latest information.
4. V_{PUMP} can be left floating during normal operation (not programming mode).
5. For ProASIC3L devices, V_{CCI} ≥ V_{CC}.
6. VMV pins must be connected to the corresponding V_{CCI} pins. See [Pin Descriptions](#) for further information.
7. V_{CCPLL} pins should be tied to V_{CC} pins. See [Pin Descriptions](#) for further information.

Table 2-3 • Flash Programming Limits – Retention, Storage, and Operating Temperature ¹

Product Grade	Programming Cycles	Program Retention (biased/unbiased)	Maximum Storage Temperature T _{STG} (°C) ²	Maximum Operating Junction Temperature T _J (°C) ²
Commercial	500	20 years	110	100
Industrial	500	20 years	110	100

Notes:

1. This is a stress rating only; functional operation at any condition other than those indicated is not implied.
2. These limits apply for program/data retention only. Refer to [Table 2-1 on page 2-1](#) and [Table 2-2](#) for device operating conditions and absolute limits.

Table 2-4 • Overshoot and Undershoot Limits¹

V _{CCI}	Average V _{CCI} -GND Overshoot or Undershoot Duration as a Percentage of Clock Cycle ²	Maximum Overshoot/Undershoot ²
2.7 V or less	10%	1.4 V
	5%	1.49 V
3 V	10%	1.1 V
	5%	1.19 V
3.3 V	10%	0.79 V
	5%	0.88 V
3.6 V	10%	0.45 V
	5%	0.54 V

Notes:

1. Based on reliability requirements at junction temperature at 85°C.
2. The duration is allowed at one out of six clock cycles. If the overshoot/undershoot occurs at one out of two cycles, the maximum overshoot/undershoot has to be reduced by 0.15 V.
3. This table does not provide PCI overshoot/undershoot limits.

I/O Power-Up and Supply Voltage Thresholds for Power-On Reset (Commercial and Industrial)

Sophisticated power-up management circuitry is designed into every ProASIC[®]3 device. These circuits ensure easy transition from the powered-off state to the powered-up state of the device. The many different supplies can power up in any sequence with minimized current spikes or surges. In addition, the I/O will be in a known state through the power-up sequence. The basic principle is shown in Figure 2-1 on page 2-4 and Figure 2-2 on page 2-5.

There are five regions to consider during power-up.

ProASIC3 I/Os are activated only if ALL of the following three conditions are met:

1. V_{CC} and V_{CCI} are above the minimum specified trip points (Figure 2-1 on page 2-4 and Figure 2-2 on page 2-5).
2. V_{CCI} > V_{CC} - 0.75 V (typical)
3. Chip is in the operating mode.

V_{CCI} Trip Point:

Ramping up: 0.6 V < trip_point_up < 1.2 V

Ramping down: 0.5 V < trip_point_down < 1.1 V

V_{CC} Trip Point:

Ramping up: 0.6 V < trip_point_up < 1.1 V

Ramping down: 0.5 V < trip_point_down < 1 V

V_{CC} and V_{CCI} ramp-up trip points are about 100 mV higher than ramp-down trip points. This specifically built-in hysteresis prevents undesirable power-up oscillations and current surges. Note the following:

- During programming, I/Os become tristated and weakly pulled up to V_{CCI}.
- JTAG supply, PLL power supplies, and charge pump V_{PUMP} supply have no influence on I/O behavior.

PLL Behavior at Brownout Condition

Actel recommends using monotonic power supplies or voltage regulators to ensure proper powerup behavior. Power ramp-up should be monotonic at least until V_{CC} and V_{CCPLX} exceed brownout activation levels. The V_{CC} activation level is specified as 1.1 V worst-case (see Figure 2-1 and Figure 2-2 on page 2-5 for more details).

When PLL power supply voltage and/or V_{CC} levels drop below the V_{CC} brownout levels ($0.75\text{ V} \pm 0.25\text{ V}$), the PLL output lock signal goes low and/or the output clock is lost. Refer to the *Power-Up Behavior of ProASIC3/IE Devices* chapter of the handbook for information on clock and lock recovery.

Internal Power-Up Activation Sequence

1. Core
2. Input buffers

Output buffers, after 200 ns delay from input buffer activation.

 Figure 2-2 • V2 Devices – I/O State as a Function of V_{CCI} and V_{CC} Voltage Levels

Thermal Characteristics

Introduction

The temperature variable in the Actel Designer software refers to the junction temperature, not the ambient temperature. This is an important distinction because dynamic and static power consumption cause the chip junction temperature to be higher than the ambient temperature.

EQ 2-1 can be used to calculate junction temperature.

$$T_J = \text{Junction Temperature} = \Delta T + T_A$$

EQ 2-1

where:

T_A = Ambient Temperature

ΔT = Temperature gradient between junction (silicon) and ambient $\Delta T = \theta_{ja} * P$

θ_{ja} = Junction-to-ambient of the package. θ_{ja} numbers are located in Table 2-5.

P = Power dissipation

Package Thermal Characteristics

The device junction-to-case thermal resistivity is θ_{jc} and the junction-to-ambient air thermal resistivity is θ_{ja} . The thermal characteristics for θ_{ja} are shown for two air flow rates. The absolute maximum junction temperature is 100°C. EQ 2-2 shows a sample calculation of the absolute maximum power dissipation allowed for a 484-pin FBGA package at commercial temperature and in still air.

$$\text{Maximum Power Allowed} = \frac{\text{Max. junction temp. (}^\circ\text{C)} - \text{Max. ambient temp. (}^\circ\text{C)}}{\theta_{ja} (^\circ\text{C/W)}} = \frac{100^\circ\text{C} - 70^\circ\text{C}}{20.5^\circ\text{C/W}} = 1.463 \text{ W}$$

EQ 2-2

Table 2-5 • Package Thermal Resistivities

Package Type	Device	Pin Count	θ_{jc}	θ_{ja}			Units
				Still Air	200 ft./min.	500 ft./min.

P _{DC4}	Static PLL contribution	1.42 mW			
P _{DC5}	Bank quiescent power (V_{CC1} -dependent)	See Table 2-7 on page 2-7, Table 2-8 on page 2-7, Table 2-10 on page 2-8.			
P _{DC6}	I/O input pin static power (standard-dependent)	See Table 2-11 on page 2-9 through Table 2-13 on page 2-10.			
P _{DC7}	I/O output pin static power (standard-dependent)	See Table 2-14 on page 2-11 through Table 2-16 on page 2-12.			

* For a different output load, drive strength, or slew rate, Actel recommends using the Actel power spreadsheet calculator or SmartPower tool in Libero IDE.

Power Calculation Methodology

This section describes a simplified method to estimate power consumption of an application. For more accurate and detailed power estimations, use the SmartPower tool in Actel Libero IDE software.

The power calculation methodology described below uses the following variables:

- The number of PLLs as well as the number and the frequency of each output clock generated
- The number of combinatorial and sequential cells used in the design
- The internal clock frequencies
- The number and the standard of I/O pins used in the design
- The number of RAM blocks used in the design
- Toggle rates of I/O pins as well as VersaTiles—guidelines are provided in [Table 2-19 on page 2-16](#).
- Enable rates of output buffers—guidelines are provided for typical applications in [Table 2-20 on page 2-16](#).
- Read rate and write rate to the memory—guidelines are provided for typical applications in [Table 2-20 on page 2-16](#). The calculation should be repeated for each clock domain defined in the design.

Methodology

Total Power Consumption— P_{TOTAL}

$$P_{TOTAL} = P_{STAT} + P_{DYN}$$

P_{STAT} is the total static power consumption.

P_{DYN} is the total dynamic power consumption.

Total Static Power Consumption— P_{STAT}

$$P_{STAT} = (P_{DC1} \text{ or } P_{DC2} \text{ or } P_{DC3}) + N_{BANKS} * P_{DC5} + N_{INPUTS} * P_{DC6} + N_{OUTPUTS} * P_{DC7}$$

N_{INPUTS} is the number of I/O input buffers used in the design.

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

N_{BANKS} is the number of I/O banks powered in the design.

Total Dynamic Power Consumption— P_{DYN}

$$P_{DYN} = P_{CLOCK} + P_{S-CELL} + P_{C-CELL} + P_{NET} + P_{INPUTS} + P_{OUTPUTS} + P_{MEMORY} + P_{PLL}$$

Global Clock Contribution— P_{CLOCK}

$$P_{CLOCK} = (P_{AC1} + N_{SPINE} * P_{AC2} + N_{ROW} * P_{AC3} + N_{S-CELL} * P_{AC4}) * F_{CLK}$$

N_{SPINE} is the number of global spines used in the user design—guidelines are provided in [Table 2-19 on page 2-16](#).

N_{ROW} is the number of VersaTile rows used in the design—guidelines are provided in [Table 2-19 on page 2-16](#).

F_{CLK} is the global clock signal frequency.

N_{S-CELL} is the number of VersaTiles used as sequential modules in the design.

P_{AC1} , P_{AC2} , P_{AC3} , and P_{AC4} are device-dependent.

Sequential Cells Contribution— P_{S-CELL}

$$P_{S-CELL} = N_{S-CELL} * (P_{AC5} + \alpha_1 / 2 * P_{AC6}) * F_{CLK}$$

N_{S-CELL} is the number of VersaTiles used as sequential modules in the design. When a multi-tile sequential cell is used, it should be accounted for as 1.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in [Table 2-19 on page 2-16](#).

F_{CLK} is the global clock signal frequency.

Combinatorial Cells Contribution— P_{C-CELL}

$$P_{C-CELL} = N_{C-CELL} * \alpha_1 / 2 * P_{AC7} * F_{CLK}$$

N_{C-CELL} is the number of VersaTiles used as combinatorial modules in the design.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in [Table 2-19 on page 2-16](#).

F_{CLK} is the global clock signal frequency.

Routing Net Contribution— P_{NET}

$$P_{NET} = (N_{S-CELL} + N_{C-CELL}) * \alpha_1 / 2 * P_{AC8} * F_{CLK}$$

N_{S-CELL} is the number of VersaTiles used as sequential modules in the design.

N_{C-CELL} is the number of VersaTiles used as combinatorial modules in the design.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in [Table 2-19 on page 2-16](#).

F_{CLK} is the global clock signal frequency.

I/O Input Buffer Contribution— P_{INPUTS}

$$P_{INPUTS} = N_{INPUTS} * \alpha_2 / 2 * P_{AC9} * F_{CLK}$$

N_{INPUTS} is the number of I/O input buffers used in the design.

α_2 is the I/O buffer toggle rate—guidelines are provided in [Table 2-19 on page 2-16](#).

F_{CLK} is the global clock signal frequency.

I/O Output Buffer Contribution— $P_{OUTPUTS}$

$$P_{OUTPUTS} = N_{OUTPUTS} * \alpha_2 / 2 * \beta_1 * P_{AC10} * F_{CLK}$$

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

α_2 is the I/O buffer toggle rate—guidelines are provided in [Table 2-19 on page 2-16](#).

β_1 is the I/O buffer enable rate—guidelines are provided in [Table 2-20 on page 2-16](#).

F_{CLK} is the global clock signal frequency.

RAM Contribution— P_{MEMORY}

$$P_{MEMORY} = P_{AC11} * N_{BLOCKS} * F_{READ-CLOCK} * \beta_2 + P_{AC12} * N_{BLOCK} * F_{WRITE-CLOCK} * \beta_3$$

N_{BLOCKS} is the number of RAM blocks used in the design.

$F_{READ-CLOCK}$ is the memory read clock frequency.

β_2 is the RAM enable rate for read operations.

$F_{WRITE-CLOCK}$ is the memory write clock frequency.

β_3 is the RAM enable rate for write operations—guidelines are provided in [Table 2-20 on page 2-16](#).

PLL Contribution— P_{PLL}

$$P_{PLL} = P_{DC4} + P_{AC13} * F_{CLKOUT}$$

F_{CLKOUT} is the output clock frequency.¹

1. If a PLL is used to generate more than one output clock, include each output clock in the formula by adding its corresponding contribution ($P_{AC13} * F_{CLKOUT}$ product) to the total PLL contribution.

Guidelines

Toggle Rate Definition

A toggle rate defines the frequency of a net or logic element relative to a clock. It is a percentage. If the toggle rate of a net is 100%, this means that this net switches at half the clock frequency. Below are some examples:

- The average toggle rate of a shift register is 100% because all flip-flop outputs toggle at half of the clock frequency.
- The average toggle rate of an 8-bit counter is 25%:
 - Bit 0 (LSB) = 100%
 - Bit 1 = 50%
 - Bit 2 = 25%
 - ...
 - Bit 7 (MSB) = 0.78125%
 - Average toggle rate = $(100\% + 50\% + 25\% + 12.5\% + \dots + 0.78125\%) / 8$

Enable Rate Definition

Output enable rate is the average percentage of time during which tristate outputs are enabled. When nontristate output buffers are used, the enable rate should be 100%.

Table 2-19 • Toggle Rate Guidelines Recommended for Power Calculation

Component	Definition	Guideline
α_1	Toggle rate of VersaTile outputs	10%
α_2	I/O buffer toggle rate	10%

Table 2-20 • Enable Rate Guidelines Recommended for Power Calculation

Component	Definition	Guideline
β_1	I/O output buffer enable rate	100%
β_2	RAM enable rate for read operations	12.5%
β_3	RAM enable rate for write operations	12.5%

* $T_J = 100^\circ\text{C}$ **Table 2-38 • Schmitt Trigger Input Hysteresis, Hysteresis Voltage Value (Typ) for Schmitt Mode Input Buffers**

Input Buffer Configuration	Hysteresis Value (typ.)
3.3 V LVTTTL/LVCMOS/PCI/PCI-X (Schmitt trigger mode)	240 mV
2.5 V LVCMOS (Schmitt trigger mode)	140 mV
1.8 V LVCMOS (Schmitt trigger mode)	80 mV
1.5 V LVCMOS (Schmitt trigger mode)	60 mV
1.2 V LVCMOS (Schmitt trigger mode)	40 mV

The length of time an I/O can withstand I_{OSH}/I_{OSL} events depends on the junction temperature. The reliability data below is based on a 3.3 V, 12 mA I/O setting, which is the worst case for this type of analysis.

For example, at 110°C, the short current condition would have to be sustained for more than three months to cause a reliability concern. The I/O design does not contain any short circuit protection, but such protection would only be needed in extremely prolonged stress conditions.

Table 2-39 • Short Current Event Duration before Failure

Temperature	Time before Failure
-40°C	> 20 years
0°C	> 20 years
25°C	> 20 years
70°C	5 years
85°C	2 years
100°C	6 months
110°C	3 months

Table 2-40 • I/O Input Rise Time, Fall Time, and Related I/O Reliability

Input Buffer	Input Rise/Fall Time (min.)	Input Rise/Fall Time (max.)	Reliability
LVTTL/LVCMOS	No requirement	10 ns *	20 years (110°C)
LVDS/BLVDS/ M-LVDS/LVPECL	No requirement	10 ns *	10 years (100°C)

* The maximum input rise/fall time is related to the noise induced into the input buffer trace. If the noise is low, then the rise time and fall time of input buffers can be increased beyond the maximum value. The longer the rise/fall times, the more susceptible the input signal is to the board noise. Actel recommends signal integrity evaluation/characterization of the system to ensure that there is no excessive noise coupling into input signals.

Single-Ended I/O Characteristics

3.3 V LVTTTL / 3.3 V LVCMOS

Low-Voltage Transistor–Transistor Logic (LVTTTL) is a general-purpose standard (EIA/JESD) for 3.3 V applications. It uses an LVTTTL input buffer and push-pull output buffer.

Table 2-41 • Minimum and Maximum DC Input and Output Levels

2.5 V LVCMOS

Low-Voltage CMOS for 2.5 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 2.5 V applications. It uses a 5 V-tolerant input buffer and push-pull output buffer.

Table 2-51 • Minimum and Maximum DC Input and Output Levels

1.8 V LVCMOS

Low-voltage CMOS for 1.8 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 1.8 V applications. It uses a 1.8 V input buffer and a push-pull output buffer.

Table 2-61 • Minimum and Maximum DC Input and Output Levels

1.5 V LVCMOS (JESD8-11)

Low-Voltage CMOS for 1.5 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 1.5 V applications. It uses a 1.5 V input buffer and a push-pull output buffer.

Table 2-71 • Minimum and Maximum DC Input and Output Levels

Note: For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.

Differential I/O Characteristics

Physical Implementation

Configuration of the I/O modules as a differential pair is handled by Actel Designer software when the user instantiates a differential I/O macro in the design.

Differential I/Os can also be used in conjunction with the embedded Input Register (InReg), Output Register (OutReg), Enable Register (EnReg), and Double Data Rate (DDR). However, there is no support for bidirectional I/Os or tristates with the LVPECL standards.

LVDS

Low-Voltage Differential Signaling (ANSI/TIA/EIA-644) is a high-speed, differential I/O standard. It requires that one data bit be carried through two signal lines, so two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in [Figure 2-23](#). The building blocks of the LVDS transmitter-receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVPECL implementation because the output standard specifications are different.

Along with LVDS I/O, ProASIC3 also supports Bus LVDS structure and Multipoint LVDS (M-LVDS) configuration (up to 40 nodes).

Figure 2-23 • LVDS Circuit Diagram and Board-Level Implementation

Table 2-126 • Minimum and Maximum DC Input and Output Levels

DC Parameter	Description	Min.	Typ.	Max.	Units
V_{CCI}	Supply Voltage	2.375	2.5	2.625	V
V_{OL}	Output Low Voltage	0.9	1.075	1.25	V
V_{OH}	Output High Voltage	1.25	1.425	1.6	V
I_{OL}^4	Output Lower Current	0.65	0.91	1.16	mA
I_{OH}^4	Output High Current	0.65	0.91	1.16	mA
V_I	Input Voltage	0		2.925	V
I_{IH}^3	Input High Leakage Current			10	μ A
I_{IL}^3	Input Low Leakage Current			10	μ A
V_{ODIFF}	Differential Output Voltage	250	350	450	mV
V_{OCM}	Output Common Mode Voltage	1.125	1.25	1.375	V
V_{ICM}	Input Common Mode Voltage	0.05	1.25	2.35	V
V_{IDIFF}	Input Differential Voltage	100	350		mV

Notes:

1. $\pm 5\%$
2. Differential input voltage = ± 350 mV.
3. Currents are measured at 85°C junction temperature.
4. I_{OL}/I_{OH} is defined by $V_{ODIFF}/(\text{Resistor Network})$.

Table 2-127 • AC Waveforms, Measuring Points, and Capacitive Loads

BLVDS/M-LVDS

Bus LVDS (BLVDS) and Multipoint LVDS (M-LVDS) specifications extend the existing LVDS standard to high-performance multipoint bus applications. Multidrop and multipoint bus configurations may contain any combination of drivers, receivers, and transceivers. Actel LVDS drivers provide the higher drive current required by BLVDS and M-LVDS to accommodate the loading. The drivers require series terminations for better signal quality and to control voltage swing. Termination is also required at both ends of the bus since the driver can be located anywhere on the bus. These configurations can be implemented using the TRIBUF_LVDS and BIBUF_LVDS macros along with appropriate terminations. Multipoint designs using Actel LVDS macros can achieve up to 200 MHz with a maximum of 20 loads. A sample application is given in Figure 2-24. The input and output buffer delays are available in the LVDS section in Table 2-126 on page 2-73.

Example: For a bus consisting of 20 equidistant loads, the following terminations provide the required differential voltage, in worst-case Industrial operating conditions, at the farthest receiver: $R_S = 60 \Omega$ and $R_T = 70 \Omega$, given $Z_0 = 50 \Omega$ (2") and $Z_{stub} = 50 \Omega$ (~1.5").

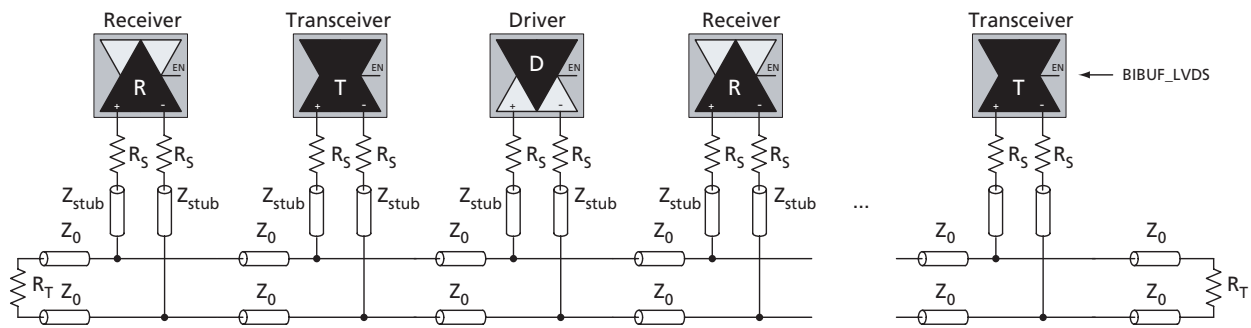

Figure 2-24 • BLVDS/M-LVDS Multipoint Application Using LVDS I/O Buffers

LVPECL

Low-Voltage Positive Emitter-Coupled Logic (LVPECL) is another differential I/O standard. It requires that one data bit be carried through two signal lines. Like LVDS, two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in [Figure 2-25](#). The building blocks of the LVPECL transmitter-receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVDS implementation because the output standard specifications are different.

Figure 2-25 • LVPECL Circuit Diagram and Board-Level Implementation

VersaTile Characteristics

VersaTile Specifications as a Combinatorial Module

The ProASIC3 library offers all combinations of LUT-3 combinatorial functions. In this section, timing characteristics are presented for a sample of the library. For more details, refer to the *IGLOO, Fusion, and ProASIC3 Macro Library Guide*.

Figure 2-35 • Sample of Combinatorial Cells

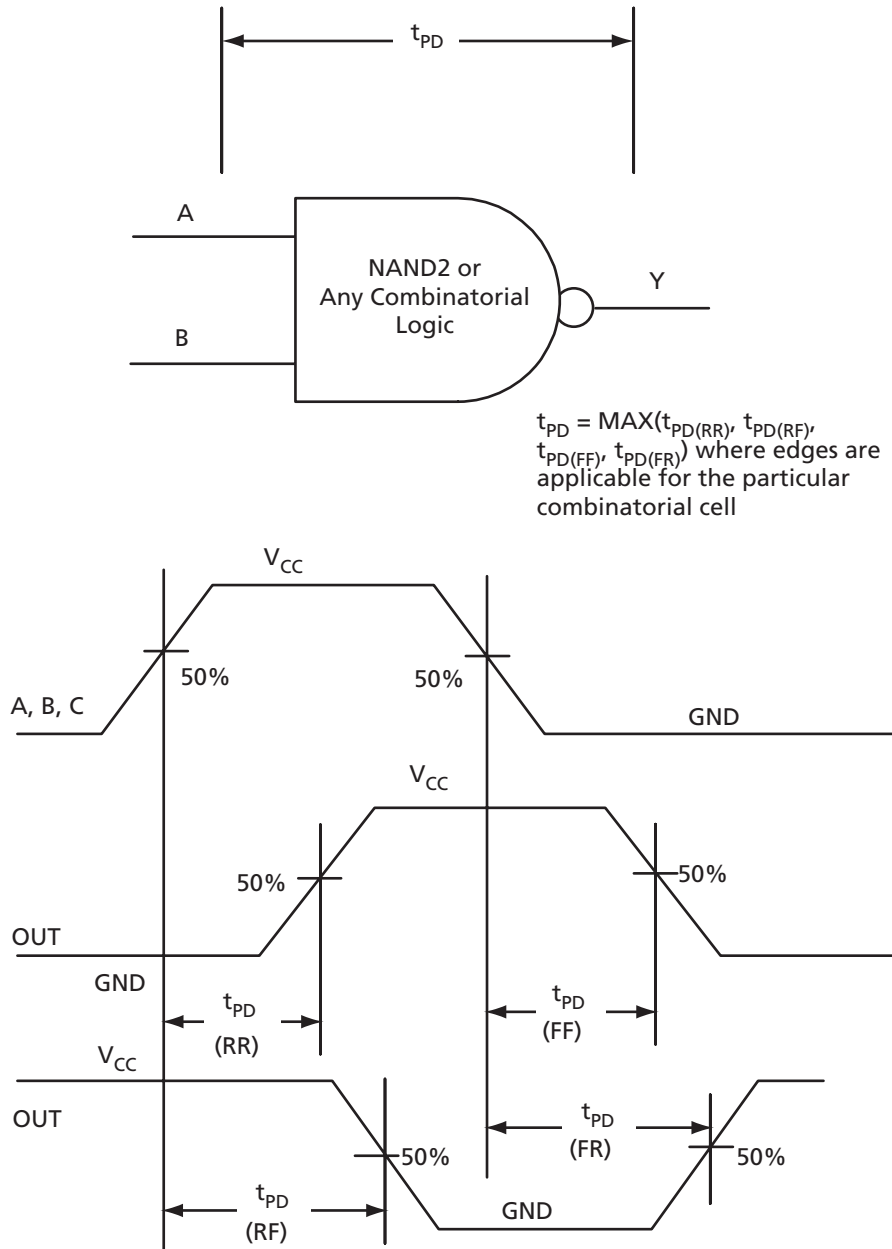

Figure 2-36 • Timing Model and Waveforms

Timing Characteristics

Table 2-143 • Combinatorial Cell Propagation Delays
 Commercial-Case Conditions: $T_j = 70^{\circ}\text{C}$, Worst-Case $V_{CC} = 1.14\text{ V}$

Combinatorial Cell	Equation	Parameter	-1	Std.	Units
INV	$Y = !A$	t_{PD}	0.54	0.63	ns
AND2	$Y = A \cdot B$	t_{PD}	0.63	0.74	ns
NAND2	$Y = !(A \cdot B)$	t_{PD}	0.63	0.74	ns
OR2	$Y = A + B$	t_{PD}	0.65	0.76	ns
NOR2	$Y = !(A + B)$	t_{PD}	0.65	0.76	ns
XOR2	$Y = A \oplus B$	t_{PD}	0.98	1.16	ns
MAJ3	$Y = \text{MAJ}(A, B, C)$	t_{PD}	0.93	1.09	ns
XOR3	$Y = A \oplus B \oplus C$	t_{PD}	1.17	1.37	ns
MUX2	$Y = A \text{ IS } + B \text{ S}$	t_{PD}	0.68	0.79	ns
AND3	$Y = A \cdot B \cdot C$	t_{PD}	0.75	0.88	ns

Note: For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-7](#) for derating values.

VersaTile Specifications as a Sequential Module

The ProASIC3 library offers a wide variety of sequential cells, including flip-flops and latches. Each has a data input and optional enable, clear, or preset. In this section, timing characteristics are presented for a representative sample from the library. For more details, refer to the *IGLOO, Fusion, and ProASIC3 Macro Library Guide*.

t_{RECPRE}	Asynchronous Preset Recovery Time for the Core Register	0.30	0.35	ns
t_{WCLR}	Asynchronous Clear Minimum Pulse Width for the Core Register	0.30	0.34	ns
t_{WPRE}	Asynchronous Preset Minimum Pulse Width for the Core Register	0.30	0.34	ns
t_{CKMPWH}	Clock Minimum Pulse Width HIGH for the Core Register	0.56	0.64	ns
t_{CKMPWL}	Clock Minimum Pulse Width LOW for the Core Register	0.56	0.64	ns

Note: For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.

Global Resource Characteristics

A3P250L Clock Tree Topology

Clock delays are device-specific. Figure 2-39 is an example of a global tree used for clock routing. The global tree presented in Figure 2-39 is driven by a CCC located on the west side of the A3P250L device. It is used to drive all D-flip-flops in the device.

Figure 2-39 • Example of Global Tree Use in an A3P250L Device for Clock Routing

Global Tree Timing Characteristics

Global clock delays include the central rib delay, the spine delay, and the row delay. Delays do not include I/O input buffer clock delays, as these are I/O standard-dependent, and the clock may be driven and conditioned internally by the CCC module. For more details on clock conditioning capabilities, refer to the "Clock Conditioning Circuits" section on page 2-95. Table 2-145 to Table 2-148 on page 2-94 present minimum and maximum global clock delays within each device. Minimum and maximum delays are measured with minimum and maximum loading.

Timing Characteristics

Table 2-145 • A3P250L Global Resource
Commercial-Case Conditions: $T_J = 70^\circ\text{C}$, $V_{CC} = 1.14\text{ V}$

Parameter	Description	-1		Std.		Units
		Min. ¹	Max. ²	Min. ¹	Max. ²	
t_{RCKL}	Input LOW Delay for Global Clock	1.40	1.68	1.64	1.97	ns
t_{RCKH}	Input HIGH Delay for Global Clock	1.38	1.71	1.62	2.01	ns
$t_{RCKMPWH}$	Minimum Pulse Width HIGH for Global Clock					ns
$t_{RCKMPWL}$	Minimum Pulse Width LOW for Global Clock					ns
t_{RCKSW}	Maximum Skew for Global Clock		0.33		0.39	ns
F_{RMAX}	Maximum Frequency for Global Clock					MHz

Notes:

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.

Table 2-146 • A3P600L Global Resource
Commercial-Case Conditions: $T_J = 70^\circ\text{C}$, $V_{CC} = 1.14\text{ V}$

Parameter	Description	-1		Std.		Units
		Min. ¹	Max. ²	Min. ¹	Max. ²	
t_{RCKL}	Input LOW Delay for Global Clock	1.48	1.76	1.74	2.07	ns

$t_{RCKMPWH}$	Minimum Pulse Width HIGH for Global Clock					ns
$t_{RCKMPWL}$	Minimum Pulse Width LOW for Global Clock					ns
t_{RCKSW}	Maximum Skew for Global Clock		0.33		0.39	ns
F_{RMAX}	Maximum Frequency for Global Clock					MHz

Notes:

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.

Table 2-147 • A3P1000L Global Resource
 Commercial-Case Conditions: $T_J = 70^\circ\text{C}$, $V_{CC} = 1.14\text{ V}$

Parameter	Description	-1		Std.		Units
		Min. ¹	Max. ²	Min. ¹	Max. ²	
t_{RCKL}	Input LOW Delay for Global Clock	1.61	1.89	1.89	2.22	ns
t_{RCKH}	Input HIGH Delay for Global Clock	1.60	1.92	1.88	2.26	ns
$t_{RCKMPWH}$	Minimum Pulse Width HIGH for Global Clock					ns
$t_{RCKMPWL}$	Minimum Pulse Width LOW for Global Clock					ns
t_{RCKSW}	Maximum Skew for Global Clock		0.33		0.39	ns
F_{RMAX}	Maximum Frequency for Global Clock					MHz

Notes:

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-7](#) for derating values.

Table 2-148 • A3PE3000L Global Resource
 Commercial-Case Conditions: $T_J = 70^\circ\text{C}$, $V_{CC} = 1.14\text{ V}$

Parameter	Description	-1		Std.		Units
		Min. ¹	Max. ²	Min. ¹	Max. ²	
t_{RCKL}	Input LOW Delay for Global Clock	1.52	1.94	1.78	2.28	ns
t_{RCKH}	Input HIGH Delay for Global Clock	1.49	1.96	1.76	2.30	ns
$t_{RCKMPWH}$	Minimum Pulse Width HIGH for Global Clock					ns
$t_{RCKMPWL}$	Minimum Pulse Width LOW for Global Clock					ns
t_{RCKSW}	Maximum Skew for Global Clock		0.47		0.55	ns
F_{RMAX}	Maximum Frequency for Global Clock					MHz

Notes:

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-7](#) for derating values.

Clock Conditioning Circuits

CCC Electrical Specifications

Timing Characteristics

Table 2-149 • ProASIC3LP CCC/PLL Specification

Parameter	Min.	Typ.	Max.	Units
Clock Conditioning Circuitry Input Frequency f_{IN_CCC}	1.5		250	MHz
Clock Conditioning Circuitry Output Frequency f_{OUT_CCC}	0.75		250	MHz
Delay Increments in Programmable Delay Blocks ^{1, 2}		270		ps
Number of Programmable Values in Each Programmable Delay Block			32	
Serial Clock (SCLK) for Dynamic PLL ³			100	MHz
Input Cycle-to-Cycle Jitter (peak magnitude)			1	ns
CCC Output Peak-to-Peak Period Jitter F_{CCC_OUT}	Max Peak-to-Peak Period Jitter			
	1 Global Network Used	External FB Used	3 Global Networks Used	
0.75 MHz to 24 MHz	0.50%	0.75%	0.70%	
24 MHz to 100 MHz	1.00%	1.50%	1.20%	
100 MHz to 250 MHz	2.50%	3.75%	2.75%	
Acquisition Time	LockControl = 0		300	μs
	LockControl = 1		6.0	ms
Tracking Jitter	LockControl = 0		2	ns
	LockControl = 1		1	ns
Output Duty Cycle	48.5		51.5	%
Delay Range in Block: Programmable Delay 1 ^{1, 2}	1.2		15.65	ns
Delay Range in Block: Programmable Delay 2 ^{1, 2}	0.025		15.65	ns
Delay Range in Block: Fixed Delay ^{1, 2}		3.1		ns

Notes:

1. This delay is a function of voltage and temperature. See Table 2-6 on page 2-7 for deratings.
2. $T_J = 25^\circ\text{C}$, $V_{CC} = 1.2\text{ V}$
3. Maximum value obtained for a Std. speed grade device in worst-case commercial conditions. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.
4. Tracking jitter is defined as the variation in clock edge position of PLL outputs with reference to PLL input clock edge. Tracking jitter does not measure the variation in PLL output period, which is covered by period jitter parameter.

Note: Peak-to-peak jitter measurements are defined by $T_{\text{peak-to-peak}} = T_{\text{period_max}} - T_{\text{period_min}}$.

Part Number and Revision Date

Part Number 51700100-002-3
Revised July 2008

List of Changes

The following table lists critical changes that were made in the current version of the chapter.

Previous Version	Changes in Current Version (Advance v0.4)	Page
Advance v0.3 (June 2008)	As a result of the Libero IDE v8.4 release, Actel now offers a wide range of core voltage support. The document was updated to change 1.2 V / 1.5 V to 1.2 V to 1.5 V.	N/A
Advance v0.2 (February 2008)	Tables have been updated to include the LVCMOS 1.2 V I/O set. DDR Tables have two additional data points added to reflect both edges for Input DDR setup and hold time. Power data table has been updated to match SmartPower data rather than simulation values.	N/A
	Table 2-1 · Absolute Maximum Ratings was updated to add VMV to the V_{CCI} parameter row and to remove the word "output" from the parameter description for V_{CCI} . Table note 3 was added.	2-1
	Table 2-2 · Recommended Operating Conditions ¹ was updated to add table note references and rearrange the order of notes. VMV was added to the V_{CCI} parameter row. A new row was added for V_{CC} , 1.5 V DC core supply voltage. The table note stating that 1.5 V data will be released at a later date is new. The table note on VMV pins is new.	2-2
	Table 2-4 · Overshoot and Undershoot Limits ¹ . The title was revised to remove "as measured on quiet I/Os." Table note 2 was revised to remove "estimated SSO density over cycles." Table note 3 was revised to remove "refers only to overshoot/undershoot limits for simultaneous switching I/Os."	2-3
	EQ 2-2 was updated. The temperature was changed to 100°C, and therefore the end result changed.	2-6
	The table notes for Table 2-7 · Quiescent Supply Current (I_{DD}) Characteristics, ProASIC3L Flash*Freeze Mode* and Table 2-8 · Quiescent Supply Current (I_{DD}) Characteristics, ProASIC3L Sleep Mode ($V_{CC} = 0$ V)* were updated to remove VMV and include P_{DC6} and P_{DC7} . The table note for Table 2-7 · Quiescent Supply Current (I_{DD}) Characteristics, ProASIC3L Flash*Freeze Mode* was updated to include V_{JTAG} .	2-7
	Table 2-9 · Quiescent Supply Current (I_{DD}) Characteristics, Shutdown Mode (V_{CC} , $V_{CCI} = 0$ V) is new.	2-7
	Note 2 of Table 2-10 · Quiescent Supply Current (I_{DD}), No ProASIC3L Flash*Freeze Mode ¹ was updated to include V_{CCPLL} . Note 4 was updated to include P_{DC6} and P_{DC7} .	2-8
	Table 2-11 · Summary of I/O Input Buffer Power (per pin) – Default I/O Software Settings through Table 2-16 · Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings ¹ were updated to change P_{DC2} to P_{DC6} and P_{DC3} to P_{DC7} . The table notes were updated to reflect that power was measured on V_{CCI} . The subtitle of the table was changed from "Applicable to Advanced I/O Banks" to "Applicable to Pro I/O Banks."	2-9 through 2-12
The word "input" in the titles of Table 2-14 · Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings ¹ and Table 2-15 · Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings ¹ , was changed to "output."	2-11, 2-12	

Previous Version	Changes in Current Version (Advance v0.4)	Page
	The value of C_{LOAD} for single-ended 3.3 V PCI was changed to 10 from 5 in Table 2-14 · Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings ¹ through Table 2-16 · Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings ¹ .	2-11 through 2-12
Advance v0.2 (continued)	The last section of Table 2-17 · Different Components Contributing to Dynamic Power Consumption in ProASIC3L Devices was made into a new table: Table 2-18 · Different Components Contributing to the Static Power Consumption in ProASIC3L Devices. The table numbers referenced for device-specific dynamic power for P_{AC9} and P_{AC10} were changed in Table 2-17 · Different Components Contributing to Dynamic Power Consumption in ProASIC3L Devices. The definition of P_{DC5} was updated and parameters P_{DC6} and P_{DC7} were added to Table 2-18 · Different Components Contributing to the Static Power Consumption in ProASIC3L Devices.	2-13
	The "Total Static Power Consumption— P_{STAT} " section was updated to revise the calculation of P_{STAT} , including P_{DC6} and P_{DC7} .	2-14
	Footnote 1 was updated to include information about P_{AC13} .	2-15
	Table 2-38 · Schmitt Trigger Input Hysteresis, Hysteresis Voltage Value (Typ) for Schmitt Mode Input Buffers was updated to include the hysteresis value for 1.2 V LVCMOS.	2-34
	The "1.2 V LVCMOS (JESD8-12A)" section is new.	2-56
Advance v0.1 (January 2008)	The "PLL Behavior at Brownout Condition" section is new.	2-4
	Table 2-145 · A3P250L Global Resource, Table 2-146 · A3P600L Global Resource, Table 2-147 · A3P1000L Global Resource, and Table 2-148 · A3PE3000L Global Resource were updated with values for t_{RCKL} , t_{RCKH} , and t_{RCKSW} .	2-93 – 2-94
	The worst-case commercial conditions were added to Table 2-153 · Embedded FlashROM Access Time.	2-109
	Table 2-17 · Different Components Contributing to Dynamic Power Consumption in ProASIC3L Devices was updated to revise the value for P_{AC14} and add parameters P_{DC1} through P_{DC5} to the table.	2-13

Actel Safety Critical, Life Support, and High-Reliability Applications Policy

The Actel products described in this advance status datasheet may not have completed Actel's qualification process. Actel may amend or enhance products during the product introduction and qualification process, resulting in changes in device functionality or performance. It is the responsibility of each customer to ensure the fitness of any Actel product (but especially a new product) for a particular purpose, including appropriateness for safety-critical, life-support, and other high-reliability applications. Consult Actel's Terms and Conditions for specific liability exclusions relating to life-support applications. A reliability report covering all of Actel's products is available on the Actel website at http://www.actel.com/documents/ORT_Report.pdf. Actel also offers a variety of enhanced qualification and lot acceptance screening procedures. Contact your local Actel sales office for additional reliability information.

Revised April 2008

List of Changes

The following table lists critical changes that were made in the current version of the chapter.

Previous Version	Changes in Current Version (v1.1)	Page
v1.0 (January 2008)	The "324-Pin FBGA" package diagram was replaced.	3-29

Datasheet Categories

Categories

In order to provide the latest information to designers, some datasheets are published before data has been fully characterized. Datasheets are designated as "Product Brief," "Advance," and "Production". The definition of these categories are as follows:

Product Brief

The product brief is a summarized version of a datasheet (advance or production) and contains general product information. This document gives an overview of specific device and family information.

Advance

This version contains initial estimated information based on simulation, other products, devices, or speed grades. This information can be used as estimates, but not for production. This label only applies to the DC and Switching Characteristics chapter of the datasheet and will only be used when the data has not been fully characterized.

Unmarked (production)

This version contains information that is considered to be final.

Export Administration Regulations (EAR)

The products described in this document are subject to the Export Administration Regulations (EAR). They could require an approved export license prior to export from the United States. An export includes release of product or disclosure of technology to a foreign national inside or outside the United States.

Actel Safety Critical, Life Support, and High-Reliability Applications Policy

The Actel products described in this advance status document may not have completed Actel's qualification process. Actel may amend or enhance products during the product introduction and qualification process, resulting in changes in device functionality or performance. It is the responsibility of each customer to ensure the fitness of any Actel product (but especially a new product) for a particular purpose, including appropriateness for safety-critical, life-support, and other high-reliability applications. Consult Actel's Terms and Conditions for specific liability exclusions relating to life-support applications. A reliability report covering all of Actel's products is available on the Actel website at http://www.actel.com/documents/ORT_Report.pdf. Actel also offers a variety of enhanced qualification and lot acceptance screening procedures. Contact your local Actel sales office for additional reliability information.
