

Features

- Wide range of operating supply voltage: 1.50V to 5.5V
- Regulated voltage drive oscillator circuit for reduced power consumption and crystal drive current
- Optimized low crystal drive current oscillation for miniature crystal units
- PT7C5027Ax series: for Flip Chip Bonding
- PT7C5027Bx series: for Wire Bonding (type)
- PT7C5027Cx series: for Wire Bonding (type)
- Recommended oscillation frequency range
- Low frequency version: 10MHz to 60MHz
- Multi-stage frequency divider for low-frequency output support: 0.9MHz(min)
- Frequency divider built-in:
- Selectable by version: f_0 , $f_0/2$, $f_0/4$, $f_0/8$, $f_0/16$, $f_0/32$, $f_0/64$
- -40 to 85 °C operating temperature range
- Standby function
 - High impedance in standby mode, oscillator stops
 - CMOS output duty level(1/2VDD)
- 50 ± 5% output duty
- 15pF output drive capability
- Die form, Wafer form or 8 pin SOIC package

Application

- Used for crystal oscillator

Description

The PT7C5027 series are miniature crystal oscillator module ICs. The oscillator circuit stage has voltage regulator drive, significantly reducing current consumption and crystal current, compared with existing devices, and significantly reducing the oscillator characteristics supply voltage dependency.

Note1: The recommended operating frequency is a yardstick value derived from the crystal used for PTI characteristics authentication. However, the oscillator frequency band is not guaranteed. Specifically, the characteristics can vary greatly due to crystal characteristics and mounting conditions, so the oscillation characteristics of components must be carefully evaluated.

Note2; "x" means A, B or C of different Pad layout type or different function.

Pad or Pin Description

Sym.	Type	Description	
XTN	O	Amplifier output.	Crystal oscillator connected between XT and XTN
XT	I	Amplifier input.	
INHN	I	Output state control input. High impedance when LOW. Power-saving pull-up resistor built in.	
VDD	P	Supply voltage	
GND	P	Ground	
Q	O	Output. Output frequency determined by internal circuit to one of f ₀ , f ₀ /2, f ₀ /4, f ₀ /8, f ₀ /16, f ₀ /32, f ₀ /64	

Function Description

Standby Function

When INHN goes LOW, the oscillator stops and the output on Q becomes high impedance.

INHN	Q	Oscillator
HIGH (or open)	f ₀ output frequency	Normal operation
Low	High impedance	Stopped

Power-saving Pull-up Resistor

The INHN pin pull-up resistance RUP1 or RUP2 changes in response to the input level (HIGH or LOW). When INHN is tied LOW level, the pull-up resistance is large (RUP1), reducing the current consumed by the resistance. When INHN is left open circuit, the pull-up resistance is small (RUP2), which increases the input susceptibility to external noise. However, the pull-up resistance ties the INHN pin HIGH level to prevent external noise from unexpectedly stopping the output.

Oscillation Detector Function

The PT7C5027 series also feature an oscillation detector circuit. This circuit functions make the outputs disable until the oscillator circuit starts and oscillation becomes stable. This alleviates the danger of abnormal oscillator output at oscillator start-up when power is applied or when INHN is switched.

Maximum Ratings

Storage Temperature	-65°C to +150°C
Supply Voltage to Ground Potential (V _{DD} to GND)	-0.5V to +7.0V
DC Input (All Other Inputs except V _{DD} & GND) ...	-0.5V to V _{DD} +0.5V
DC Output.....	-0.5V to V _{DD} +0.5V
DC Output Current (all outputs)	20mA

Note:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

When INHN goes HIGH to LOW, the Q output goes HIGH once and then becomes high impedance.
 When INHN goes LOW to HIGH, the Q output from high impedance to normal output operation when the oscillation starts (oscillation is detected)
 *: the high impedance interval in the figure is shown as a LOW level due to the 1KΩ pull-down resistor connected to the Q pin(see “ Measurement circuit 2 ” in the “Measurement circuits” section)
