

# Programmable Synchronous PWM Buck Converter with 1.5V/2.5V Dual Low Dropout Linear Regulator Controller

## General Description

The RT9221 integrates a PWM controller and two low-dropout linear regulators into a single chip. The PWM controller provides the CPU core voltage controlled by a 5-bit DAC and the linear section regulates power for GTL bus, clock driver or other circuits on motherboards. The PWM controller provides an adjustable Intel-compatible 1.3V~3.5V output voltage. The synchronous N-MOSFET driver with 200 KHz switching frequency optimizes the efficiency, device size, and cost built-in over-voltage and current-limiting protection prevent the CPU from damage. Power-good signal is sent when the core voltage is within  $\pm 10\%$  of the setting point.

The linear section is a low dropout regulator which drives low cost NPN transistors to supply the 1.5V and 2.5V regulated output power.
