

## Mobile SDRAM

512K x 32Bit x 2Banks

## Mobile Synchronous DRAM

### FEATURES

- 1.8V power supply
- LVCMOS compatible with multiplexed address
- Dual banks operation
- MRS cycle with address key programs
  - CAS Latency (1, 2 & 3)
  - Burst Length (1, 2, 4, 8 & full page)
  - Burst Type (Sequential & Interleave)
- EMRS cycle with address key programs.
- All inputs are sampled at the positive going edge of the system clock
- Burst Read Single-bit Write operation
- Special Function Support.
  - PASR (Partial Array Self Refresh)
  - TCSR (Temperature compensated Self Refresh)
  - DS (Driver Strength)
- DQM for masking
- Auto & self refresh
- 64ms refresh period (4K cycle)

### GENERAL DESCRIPTION

The M52D32321A is 33,554,432 bits synchronous high data rate Dynamic RAM organized as 2 x 524,288 words by 32 bits, fabricated with high performance CMOS technology. Synchronous design allows precise cycle control with the use of system clock I/O transactions are possible on every clock cycle. Range of operating frequencies, programmable burst length and programmable latencies allow the same device to be useful for a variety of high bandwidth, high performance memory system applications.

## FUNCTIONAL BLOCK DIAGRAM

## PIN FUNCTION DESCRIPTION

Pin	Name	Input Function
CLK	System Clock	Active on the positive going edge to sample all inputs.
$\overline{\text{CS}}$	Chip Select	Disables or enables device operation by masking or enabling all inputs except CLK, CKE and DQM.
CKE	Clock Enable	Masks system clock to freeze operation from the next clock cycle. CKE should be enabled at least one cycle prior to new command. Disable input buffers for power down in standby.
A0 ~ A10	Address	Row / column addresses are multiplexed on the same pins. Row address : RA0 ~ RA10, column address : CA0 ~ CA7
BA	Bank Select Address	Selects bank to be activated during row address latch time. Selects bank for read/write during column address latch time.
$\overline{\text{RAS}}$	Row Address Strobe	Latches row addresses on the positive going edge of the CLK with $\overline{\text{RAS}}$ low. Enables row access & precharge.
$\overline{\text{CAS}}$	Column Address Strobe	Latches column addresses on the positive going edge of the CLK with $\overline{\text{CAS}}$ low. Enables column access.
$\overline{\text{WE}}$	Write Enable	Enables write operation and row precharge. Latches data in starting from $\overline{\text{CAS}}$ , $\overline{\text{WE}}$ active.
DQM0~3	Data Input / Output Mask	Makes data output Hi-Z, $t_{\text{SHZ}}$ after the clock and masks the output. Blocks data input when DQM active.
DQ0 ~ 31	Data Input / Output	Data inputs/outputs are multiplexed on the same pins.
VDD/VSS	Power Supply/Ground	Power and ground for the input buffers and the core logic.
VDDQ/VSSQ	Data Output Power/Ground	Isolated power supply and ground for the output buffers to provide improved noise immunity.
N.C/RFU	No Connection/ Reserved for Future Use	This pin is recommended to be left No Connection on the device.

**ABSOLUTE MAXIMUM RATINGS**

Parameter	Symbol	Value	Unit
Voltage on any pin relative to V <sub>SS</sub>	V <sub>IN</sub> , V <sub>OUT</sub>	-1.0 ~ 2.6	V
Voltage on V <sub>DD</sub> supply relative to V <sub>SS</sub>	V <sub>DD</sub> , V <sub>DDQ</sub>	-1.0 ~ 2.6	V
Storage temperature	T <sub>STG</sub>	-55 ~ + 150	°C
Power dissipation	P <sub>D</sub>	0.7	W
Short circuit current	I <sub>OS</sub>	50	mA

**Note:** Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded.  
 Functional operation should be restricted to recommended operating condition.  
 Exposure to higher than recommended voltage for extended periods of time could affect device reliability.

**DC OPERATING CONDITIONS**

Recommended operating conditions (Voltage referenced to V<sub>SS</sub> = 0V, T<sub>A</sub> = 0 °C ~ 70 °C )

Last data in to burst stop	$t_{BDL}(\min)$	1		CLK	2	
Col. Address to col. Address delay	$t_{CCD}(\min)$	1		CLK	3	
Refresh period (4,096 rows)	$t_{REF}(\max)$	64		ms	5	
Number of valid output data	CAS latency=3	2		ea	4	
	CAS latency=2	1				

### Note:

- The minimum number of clock cycles is determined by dividing the minimum time required with clock cycle time and then rounding off to the next higher integer.
- Minimum delay is required to complete write.
- All parts allow every cycle column address change.
- In case of row precharge interrupt, auto precharge and read burst stop.  
The earliest a precharge command can be issued after a Read command without the loss of data is  $CL+BL-2$  clocks.
- A maximum of eight consecutive AUTO REFRESH commands (with  $t_{RFCmin}$ ) can be posted to any given SDRAM, and the maximum absolute interval between any AUTO REFRESH command and the next AUTO REFRESH command is  $8 \times 15.6 \mu s$ .
- A new command may be given  $t_{RFC}$  after self refresh exit.

\*All AC parameters are measured from half to half.

**Note:** 1.Parameters depend on programmed CAS latency.

2.If clock rising time is longer than 1ns,(tr/2-0.5)ns should be added to the parameter.

3.Assumed input rise and fall time (tr & tf)=1ns.

If tr & tf is longer than 1ns, transient time compensation should be considered, i.e., [(tr+ tf)/2-1]ns should be added to the parameter.

**POWER UP SEQUENCE**

1. Apply power and start clock, attempt to maintain CKE= "H", DQM = "H" and the other pin are NOP condition at the inputs.
2. Maintain stable power, stable clock and NOP input condition for a minimum of 200us.
3. Issue precharge commands for all banks of the devices.
4. Issue 2 or more auto-refresh commands.
5. Issue a mode register set command to initialize the mode register.
6. Issue an extended mode register set command to define special function of the device after normal MRS.

Cf.) Sequence of 4~6 is regardless of the order.

### Note:

- OP Code: Operation Code  
A0~A10/AP, BA: Program keys.(@MRS). BA=0 for MRS and BA=1 for EMRS.
- MRS/EMRS can be issued only at both banks precharge state.  
A new command can be issued after 2 clock cycle of MRS/EMRS.
- Auto refresh functions are as same as CBR refresh of DRAM.  
The automatical precharge without row precharge command is meant by "Auto".  
Auto / self refresh can be issued only at both banks precharge state.
- BA: Bank select address.  
If "Low": at read, write, row active and precharge, bank A is selected.  
If "High": at read, write, row active and precharge, bank B is selected.  
If A10/AP is "High" at row precharge, BA ignored and both banks are selected.
- During burst read or write with auto precharge, new read/write command can not be issued.  
Another bank read /write command can be issued after the end of burst.  
New row active of the associated bank can be issued at  $t_{RP}$  after the end of burst.
- Burst stop command is valid at every burst length.
- DQM sampled at positive going edge of a CLK masks the data-in at the very CLK (Write DQM latency is 0), but makes Hi-Z state the data-out of 2 CLK cycles after. (Read DQM latency is 2)

## Single Bit Read-Write-Read Cycle (Same Page) @CAS Latency=3, Burst Length=1

**\*Note:** 1. All inputs except CKE & DQM can be don't care when  $\overline{CS}$  is high at the CLK high going edge.

2. Bank active & read/write are controlled by BA.

BA	Active & Read/Write
0	Bank A
1	Bank B

3. Enable and disable auto precharge function are controlled by A10/AP in read/write command.

A10/AP	BA	Operation
0	0	Disable auto precharge, leave bank A active at end of burst.
	1	Disable auto precharge, leave bank B active at end of burst.
1	0	Enable auto precharge, precharge bank A at end of burst.
	1	Enable auto precharge, precharge bank B at end of burst.

4. A10/AP and BA control bank precharge when precharge command is asserted.

A10/AP	BA	precharge
0	0	Bank A
0	1	Bank B
1	X	Both Banks

## Power Up Sequence

## Read & Write Cycle at Same Bank @Burst Length = 4

**\*Note:** 1. Minimum row cycle times is required to complete internal DRAM operation.

2. Row precharge can interrupt burst on any cycle. [CAS Latency-1] number of valid output data is available after Row precharge. Last valid output will be Hi-Z( $t_{SHZ}$ ) after the clock.

3. Access time from Row active command.  $t_{cc} = (t_{RCD} + \text{CAS latency} - 1) + t_{SAC}$

4. Output will be Hi-Z after the end of burst. (1,2,4,8 bit burst)

Burst can't end in Full Page Mode.

## Page Read & Write Cycle at Same Bank @ Burst Length=4

**\*Note 1:** To write data before burst read ends, DQM should be asserted three cycle prior to write command to avoid bus contention.

2. Row precharge will interrupt writing. Last data input,  $t_{RDL}$  before Row precharge, will be written.

3. DQM should mask invalid input data on precharge command cycle when asserting precharge before end of burst. Input data after Row precharge cycle will be masked internally.

## Page Read Cycle at Different Bank @ Burst Length=4

\*Note: 1.  $\overline{CS}$  can be don't cared when  $\overline{RAS}$ ,  $\overline{CAS}$  and  $\overline{WE}$  are high at the clock high going edge.

2. To interrupt a burst read by row precharge, both the read and the precharge banks must be the same.

## Page Write Cycle at Different Bank @Burst Length = 4

\*Note: 1. To interrupt burst write by Row precharge, DQM should be asserted to mask invalid input data.

2. To interrupt burst write by row precharge, both the write and the precharge banks must be the same.

## Read & Write Cycle at Different Bank @ Burst Length = 4

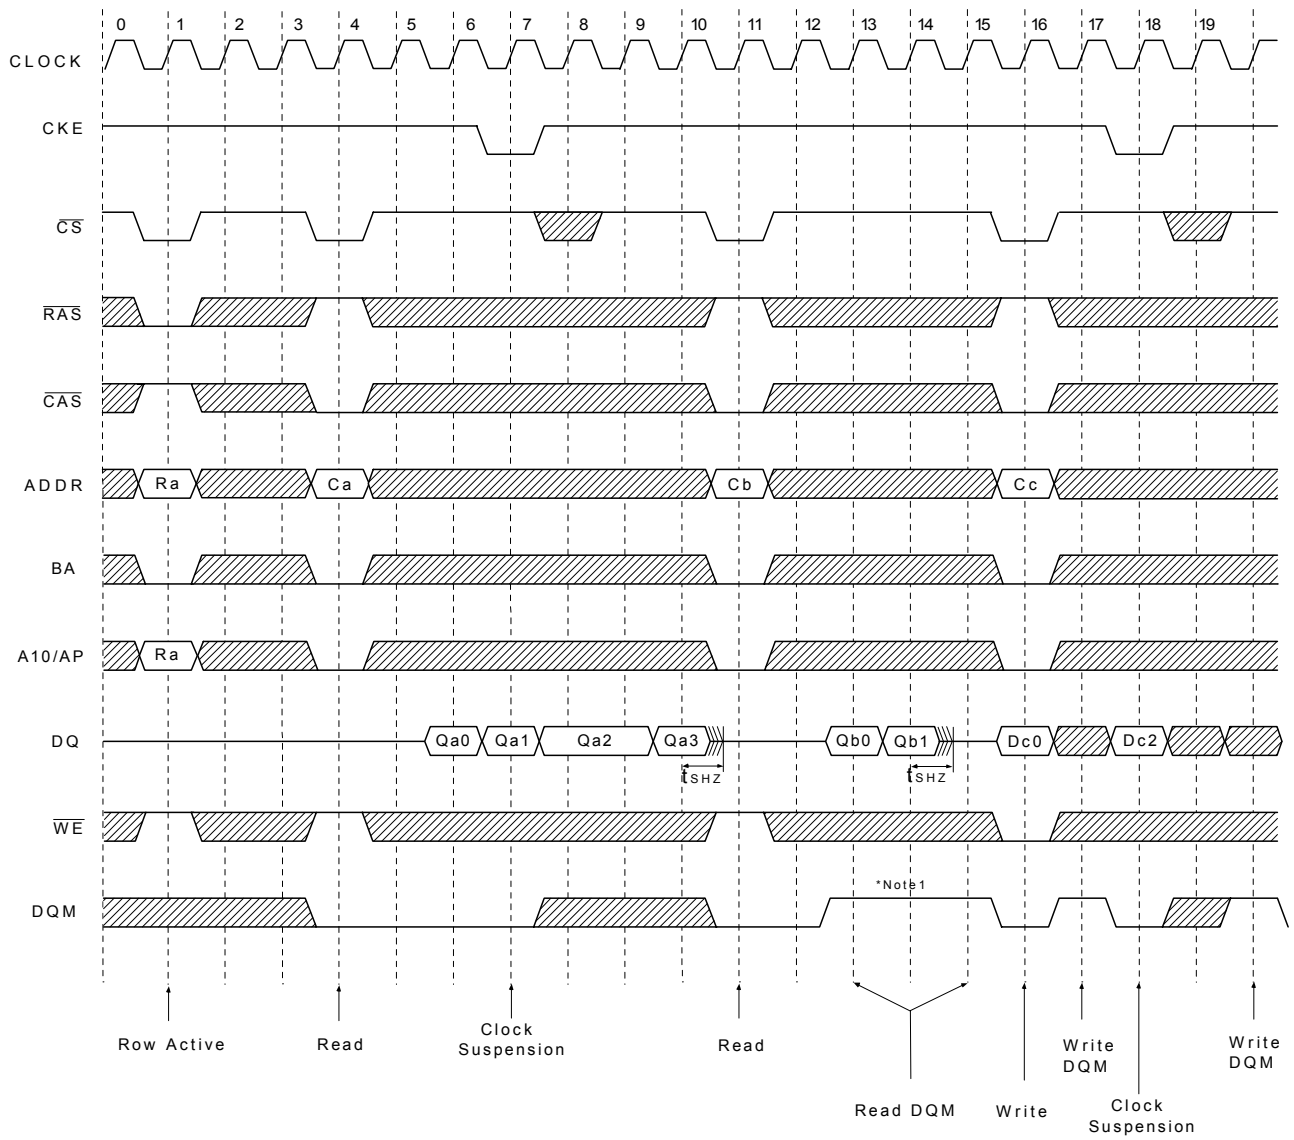

\*Note: 1. $t_{CDL}$  should be met to complete write.

## Read & Write Cycle with auto Precharge @ Burst Length =4

\*Note: 1.tCDL Should be controlled to meet minimum  $t_{RAS}$  before internal precharge start  
(In the case of Burst Length=1 & 2 and BRSW mode)

## Clock Suspension & DQM Operation Cycle @CAS Latency=2, Burst Length=4

\*Note:1.DQM is needed to prevent bus contention.

## Read Interrupted by Precharge Command & Read Burst Stop Cycle @Burst Length =Full page

**\*Note:** 1. Burst can't end in full page mode, so auto precharge can't issue.

2. About the valid DQs after burst stop, it is same as the case of  $\overline{\text{RAS}}$  interrupt.

Both cases are illustrated above timing diagram. See the label 1,2 on them.

But at burst write, burst stop and  $\overline{\text{RAS}}$  interrupt should be compared carefully.

Refer the timing diagram of "Full page write burst stop cycle".

3. Burst stop is valid at every burst length.

## Write Interrupted by Precharge Command & Write Burst stop Cycle @ Burst Length =Full page

**\*Note:** 1. Burst can't end in full page mode, so auto precharge can't issue.

2.Data-in at the cycle of interrupted by precharge can not be written into the corresponding memory cell. It is defined by AC parameter of  $t_{rDL}$ .

DQM at write interrupted by precharge command is needed to prevent invalid write.

Input data after Row precharge cycle will be masked internally.

3.Burst stop is valid at every burst length.

## Burst Read Single bit Write Cycle @Burst Length=2

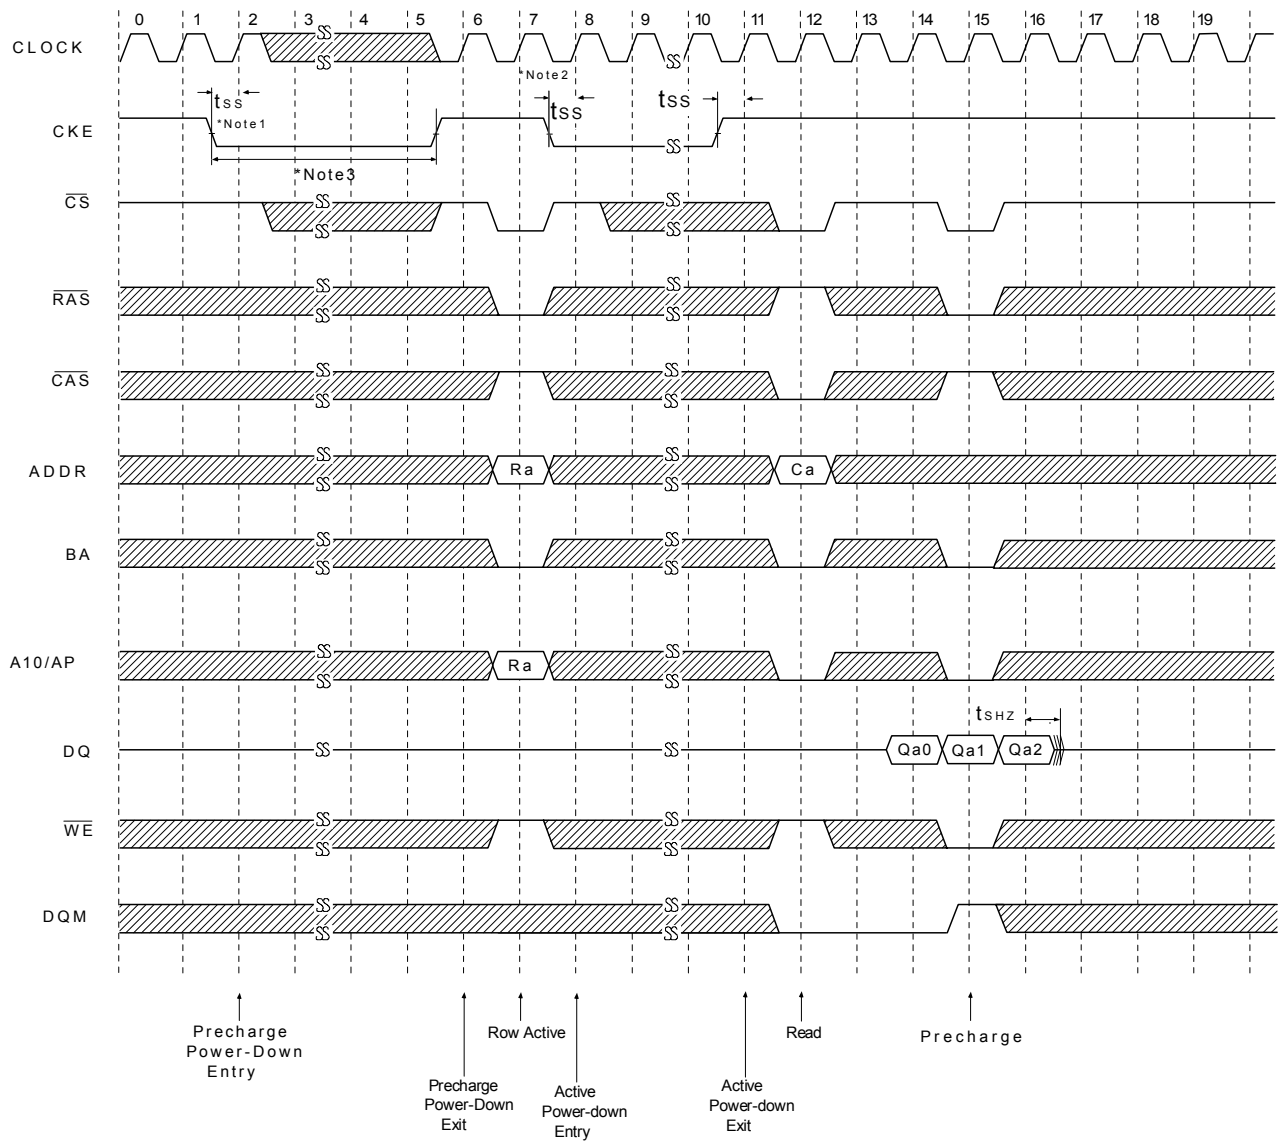

\*Note:1.BRSW modes is enabled by setting A9 "High" at MRS(Mode Register Set).

At the BRSW Mode, the burst length at write is fixed to "1" regardless of programmed burst length.

2.When BRSW write command with auto precharge is executed, keep it in mind that  $t_{RAS}$  should not be violated.

Auto precharge is executed at the next cycle of burst-end, so in the case of BRSW write command, the precharge command will be issued after two clock cycles.

## Active/Precharge Power Down Mode @CAS Latency=2, Burst Length=4

**\*Note** :1.Both banks should be in idle state prior to entering precharge power down mode.

2.CKE should be set high at least  $1CLK+t_{ss}$  prior to Row active command.

3.Can not violate minimum refresh specification. (64ms)

## Self Refresh Entry & Exit Cycle

### \*Note: TO ENTER SELF REFRESH MODE

1.  $\overline{CS}$ ,  $\overline{RAS}$  &  $\overline{CAS}$  with CKE should be low at the same clock cycle.
  2. After 1 clock cycle, all the inputs including the system clock can be don't care except for CKE.
  3. The device remains in self refresh mode as long as CKE stays "Low".
- cf.) Once the device enters self refresh mode, minimum t<sub>RAS</sub> is required before exit from self refresh.

### TO EXIT SELF REFRESH MODE

4. System clock restart and be stable before returning CKE high.
5.  $\overline{CS}$  Starts from high.
6. Minimum t<sub>RFC</sub> is required after CKE going high to complete self refresh exit.
7. 4K cycles of burst auto refresh is required immediately before self refresh entry and immediately after self refresh exit.

## Mode Register Set Cycle

## Auto Refresh Cycle

:Don't Care

\*Both banks precharge should be completed before Mode Register Set cycle and auto refresh cycle.

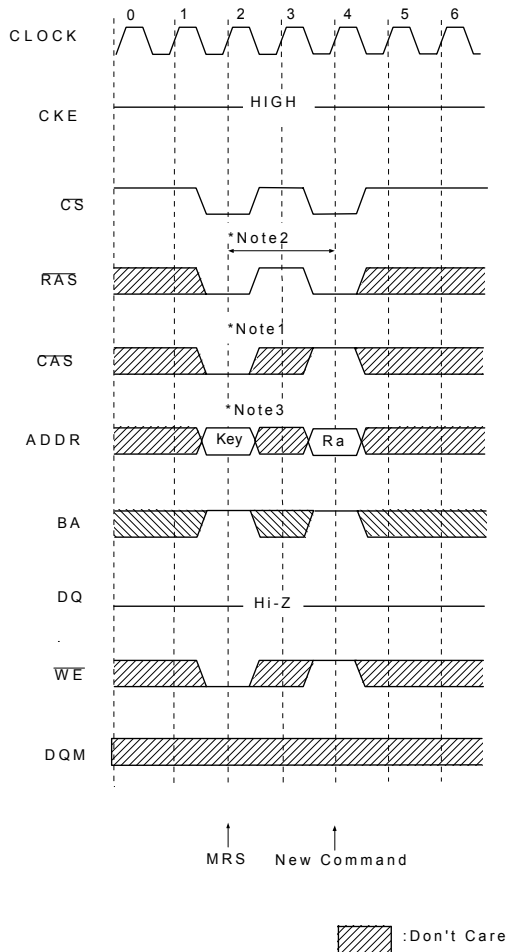

### MODE REGISTER SET CYCLE

\*Note: 1.  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$  &  $\overline{WE}$  activation at the same clock cycle with address key will set internal mode register.

2. Minimum 2 clock cycles should be met before new  $\overline{RAS}$  activation.

3. Please refer to Mode Register Set table.

## Extended Mode Register Set Cycle

\*Both banks precharge should be completed before Extended Mode Register Set cycle.

### EXTENDED MODE REGISTER SET CYCLE

\*Note: 1.  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$  &  $\overline{WE}$  activation at the same clock cycle with address key will set internal mode register.

2. Minimum 2 clock cycles should be met before new  $\overline{RAS}$  activation.

3. Please refer to Mode Register Set table.

**Revision History**

Revision	Date	Description
1.0	2006.11.02	Original
1.1	2007.03.02	Delete BGA ball name of packing dimensions
1.2	2007.05.03	Modify DC Characteristics
1.3	2007.05.14	Modify tSS (1.5ns => 2.5ns) and tSH(1ns => 1.5ns)
1.4	2007.07.10	Modify type error
1.5	2009.01.15	<ol style="list-style-type: none"><li>1. Move Revision History to the last</li><li>2. Modify the test condition of ICC3N</li><li>3. Add the specification of <math>t_{REF}</math></li><li>4. Modify the description about self refresh operation</li><li>5. Upgrade the specification of speed grade - 7 instead of -7.5</li><li>6. Add the description about A9 bit of MRS</li></ol>
1.6	2009.05.04	<ol style="list-style-type: none"><li>1. Add the specification of <math>t_{RFC}</math></li><li>2. Correct the voltage of absolute maximum ratings</li><li>3. Correct L(U)DQM to DQM0~3</li><li>4. Correct Power Up Sequence for EMRS and add the chart of EMRS</li></ol>
