### 3.3V $256 \mathrm{~K} \times 18$ pipeline burst synchronous SRAM

## Features

- Organization: 262,144 words $\times 18$ bits
- Fast clock speeds to 200 MHz
- Fast clock to data access: $3.0 / 3.5 / 4.0 \mathrm{~ns}$
- Fast $\overline{\mathrm{OE}}$ access time: $3.0 / 3.5 / 4.0 \mathrm{~ns}$
- Fully synchronous register-to-register operation
- Single-cycle deselect
- Asynchronous output enable control
- Available in 100-pin TQFP package
- Individual byte write and global write
- Multiple chip enables for easy expansion
- Linear or interleaved burst control
- Snooze mode for reduced power-standby
- Common data inputs and data outputs
- 3.3 V core power supply
$\cdot 2.5 \mathrm{~V}$ or $3.3 \mathrm{~V} \mathrm{I} / \mathrm{O}$ operation with separate $\mathrm{V}_{\mathrm{DDQ}}$

[^0]Pin arrangement

## Functional description

The AS7C33256PFS18B is a high performance CMOS 4 Mbit synchronous Static Random Access Memory (SRAM) devices organized as 262,144 words $\times 18$ bits and incorporate a pipeline for highest frequency on any given technology.
Timing for this device is compatible with existing Pentium ${ }^{\circledR}$ synchronous cache specifications. This architecture is suited for ASIC, DSP, and PowerPC ${ }^{\text {TM1 }}$-based systems in computing, datacom, instrumentation, and telecommunications systems.
Fast cycle times of $5.0 / 6.0 / 7.5 \mathrm{~ns}$ with clock access times ( $\mathrm{t}_{\mathrm{CD}}$ ) of $3.0 / 3.5 / 4.0 \mathrm{~ns}$ enable 200 , 166 and 133 MHz bus frequencies. Three chip enable inputs permit easy memory expansion. Burst operation is initiated in one of two ways: the controller address strobe ( $\overline{\mathrm{ADSC}})$, or the processor address strobe $(\overline{\mathrm{ADSP}})$. The burst advance pin ( $\overline{\mathrm{ADV}})$ allows subsequent internally generated burst addresses.
Read cycles are initiated with $\overline{\mathrm{ADSP}}$ (regardless of $\overline{\mathrm{WE}}$ and $\overline{\mathrm{ADSC}}$ ) using the new external address clocked into the on-chip address register. When $\overline{\mathrm{ADSP}}$ is sampled LOW, the chip enables are sampled active, and the output buffer is enabled with $\overline{\mathrm{OE}}$. In a read operation the data accessed by the current address, registered in the address registers by the positive edge of CLK, are carried to the data-out registers and driven on the output pins on the next positive edge of CLK. $\overline{\mathrm{ADV}}$ is ignored on the clock edge that samples $\overline{\mathrm{ADSP}}$ asserted but is sampled on all subsequent clock edges. Address is incremented internally for the next access of the burst when $\overline{\mathrm{ADV}}$ is sampled LOW and both address strobes are HIGH. Burst mode is selectable with the $\overline{\mathrm{LBO}}$ input. With $\overline{\mathrm{LBO}}$ unconnected or driven HIGH, burst operations use a Pentium ${ }^{\circledR}$ count sequence. With $\overline{\mathrm{LBO}}$ driven LOW the device uses a linear count sequence suitable for PowerPC ${ }^{\mathrm{TM}}$ and many other applications.
Write cycles are performed by disabling the output buffers with $\overline{\mathrm{OE}}$ and asserting a write command. A global write enable $\overline{\text { GWE }}$ writes all 18 bits regardless of the state of individual $\overline{\mathrm{BW}[\mathrm{a}: \mathrm{b}]}$ inputs. Alternately, when $\overline{\mathrm{GWE}}$ is HIGH, one or more bytes may be written by asserting $\overline{\mathrm{BWE}}$ and the appropriate individual byte $\overline{\mathrm{BWn}}$ signal(s).
$\overline{\mathrm{BWn}}$ is ignored on the clock edge that samples $\overline{\mathrm{ADSP}}$ LOW, but is sampled on all subsequent clock edges. Output buffers are disabled when $\overline{\mathrm{BWn}}$ is sampled LOW (regardless of $\overline{\mathrm{OE}}$ ). Data is clocked into the data input register when $\overline{\mathrm{BWn}}$ is sampled LOW. Address is incremented internally to the next burst address if $\overline{\mathrm{BWn}}$ and $\overline{\mathrm{ADV}}$ are sampled LOW.
Read or write cycles may also be initiated with $\overline{\mathrm{ADSC}}$ instead of $\overline{\mathrm{ADSP}}$. The differences between cycles initiated with $\overline{\mathrm{ADSC}}$ and $\overline{\mathrm{ADSP}}$ are as follows:

- $\overline{\mathrm{ADSP}}$ must be sampled HIGH when $\overline{\mathrm{ADSC}}$ is sampled LOW to initiate a cycle with $\overline{\mathrm{ADSC}}$.
- $\overline{\mathrm{WE}}$ signals are sampled on the clock edge that samples $\overline{\mathrm{ADSC}}$ LOW (and $\overline{\mathrm{ADSP}} \mathrm{HIGH}$ ).
- Master chip select $\overline{\mathrm{CE} 0}$ blocks $\overline{\mathrm{ADSP}}$, but not $\overline{\mathrm{ADSC}}$.

The AS7C33256PFS18B operates from a 3.3 V supply. I/Os use a separate power supply that can operate at 2.5 V or 3.3 V . These devices are available in a 100 -pin $14 \times 20 \mathrm{~mm}$ TQFP package.
TQFP capacitance

| Parameter | Symbol | Test conditions | Min | Max | Unit |
| :--- | :---: | :---: | :---: | :---: | :---: |

## Signal descriptions

| Signal | I/O | Properties | Description |
| :---: | :---: | :---: | :---: |
| CLK | I | CLOCK | Clock. All inputs except OE, ZZ, LBO are synchronous to this clock. |
| A,A0,A1 | I | SYNC | Address. Sampled when all chip enables are active and $\overline{\mathrm{ADSC}}$ or $\overline{\mathrm{ADSP}}$ are asserted. |
| DQ[a,b] | I/O | SYNC | Data. Driven as output when the chip is enabled and OE is active. |
| $\overline{\text { CE0 }}$ | I | SYNC | Master chip enable. Sampled on clock edges when ADSP or ADSC is active. When $\overline{\mathrm{CE} 0}$ is inactive, $\overline{\mathrm{ADSP}}$ is blocked. Refer to the Synchronous Truth Table for more information. |
| CE1, $\overline{\mathrm{CE} 2}$ | I | SYNC | Synchronous chip enables. Active HIGH and active LOW, respectively. Sampled on clock edges when $\overline{\mathrm{ADSC}}$ is active or when $\overline{\mathrm{CE} 0}$ and $\overline{\mathrm{ADSP}}$ are active. |
| $\overline{\text { ADSP }}$ | I | SYNC | Address strobe (processor). Asserted LOW to load a new address or to enter standby mode. |
| $\overline{\text { ADSC }}$ | I | SYNC | Address strobe (controller). Asserted LOW to load a new address or to enter standby mode. |
| ADV | I | SYNC | Burst advance. Asserted LOW to continue burst read/write. |
| $\overline{\mathrm{GWE}}$ | I | SYNC | Global write enable. Asserted LOW to write all 18 bits. When HIGH, BWE and $\overline{\mathrm{BW}}[\mathrm{a}, \mathrm{b}]$ control write enable. |
| $\overline{\text { BWE }}$ | I | SYNC | Byte write enable. Asserted LOW with GWE $=$ HIGH to enable effect of BW[a,b] inputs. |
| $\overline{\text { BW [a,b] }}$ | I | SYNC | Write enables. Used to control write of individual bytes when GWE $=\mathrm{HIGH}$ and $\overline{\mathrm{BWE}}=$ LOW. If any of $\overline{\mathrm{BW}[\mathrm{a}, \mathrm{b}]}$ is active with $\overline{\mathrm{GWE}}=\mathrm{HIGH}$ and $\overline{\mathrm{BWE}}=$ LOW the cycle is a write cycle. If all $\overline{\mathrm{BW}[\mathrm{a}, \mathrm{b}]}$ are inactive, the cycle is a read cycle. |
| $\overline{\mathrm{OE}}$ | I | ASYNC | Asynchronous output enable. I/O pins are driven when OE is active and the chip is in read mode. |
| $\overline{\text { LBO }}$ | I | STATIC | Selects Burst mode. When tied to $\mathrm{V}_{\mathrm{DD}}$ or left floating, device follows interleaved Burst order. When driven Low, device follows linear Burst order. This signal is internally pulled High. |
| ZZ | I | ASYNC | Snooze. Places device in low power mode; data is retained. Connect to GND if unused. |
| NC | - | - | No connect |

## Snooze Mode

SNOOZE MODE is a low current, power-down mode in which the device is deselected and current is reduced to $\mathrm{I}_{\mathrm{SB} 2}$. The duration of SNOOZE MODE is dictated by the length of time the ZZ is in a High state.

The ZZ pin is an asynchronous, active high input that causes the device to enter SNOOZE MODE.
When the ZZ pin becomes a logic High, $\mathrm{I}_{\mathrm{SB} 2}$ is guaranteed after the time $\mathrm{t}_{\mathrm{ZZI}}$ is met. After entering SNOOZE MODE, all inputs except ZZ is disabled and all outputs go to High-Z. Any operation pending when entering SNOOZE MODE is not guaranteed to successfully complete. Therefore, SNOOZE MODE (READ or WRITE) must not be initiated until valid pending operations are completed. Similarly, when exiting SNOOZE MODE during $t_{\text {PUS }}$, only a DESELECT or READ cycle should be given while the SRAM is transitioning out of SNOOZE MODE.

## Write enable truth table (per byte)

| Function | $\overline{\text { GWE }}$ | $\overline{\mathbf{B W E}}$ | $\overline{\text { BWa }}$ | $\overline{\mathbf{B W b}}$ |
| :--- | :---: | :---: | :---: | :---: |
| Write All Bytes | L | X | X | X |
|  | H | L | L | L |
| Write Byte a | H | L | L | H |
| Write Byte b | H | L | H | L |
| Read | H | H | X | X |
|  | H | L | H | H |

Key: $\mathrm{X}=$ don't care, $\mathrm{L}=$ low, $\mathrm{H}=$ high, $\mathrm{n}=\mathrm{a}, \mathrm{b} ; \overline{\mathrm{BWE}}, \overline{\mathrm{BWn}}=$ internal write signal.

## Asynchronous Truth Table

| Operation | $\mathbf{Z Z}$ | $\overline{\mathbf{O E}}$ | I/O Status |
| :--- | :---: | :---: | :---: |
| Snooze mode | H | X | High-Z |
| Read | L | L | Dout |
|  | L | H | High-Z |
| Write | L | X | Din, High-Z |
| Deselected | L | X | High-Z |

Notes:

1. X means "Don't Care"
2. ZZ pin is pulled down internally
3. For write cycles that follows read cycles, the output buffers must be disabled with $\overline{\mathrm{OE}}$, otherwise data bus contention will occur.
4. Snooze mode means power down state of which stand-by current does not depend on cycle times
5. Deselected means power down state of which stand-by current depends on cycle times

## Burst sequence table

| Interleaved burst address ( $\overline{\mathrm{LBO}}=1$ ) |  |  |  |  | Linear burst address ( $\overline{\mathrm{LBO}}=0$ ) |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | A1 A0 | A1 A0 | A1 A0 | A1 A0 |  | A1 A0 | A1 A0 | A1 A0 | A1 A0 |
| $1^{\text {st }}$ Address | 00 | 01 | 10 | 11 | $1^{\text {st }}$ Address | 00 | 01 | 10 | 11 |
| $2^{\text {nd }}$ Address | 01 | 00 | 11 | 10 | $2^{\text {nd }}$ Address | 01 | 10 | 11 | 00 |
| $3{ }^{\text {rd }}$ Address | 10 | 11 | 00 | 01 | $3{ }^{\text {rd }}$ Address | 10 | 11 | 00 | 01 |
| $4^{\text {th }}$ Address | 11 | 10 | 01 | 00 | $4^{\text {th }}$ Address | 11 | 10 | 01 | 10 |

## Synchronous truth table ${ }^{[4]}$

| $\overline{C E 0}^{1}$ | CE1 | CE2 | ADSP | $\overline{\text { ADSC }}$ | ADV | $\overline{\text { WRITE }}^{[2]}$ | OE | Address accessed | CLK | Operation | DQ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| H | X | X | X | L | X | X | X | NA | L to H | Deselect | Hi-Z |
| L | L | X | L | X | X | X | X | NA | L to H | Deselect | $\mathrm{Hi}-\mathrm{Z}$ |
| L | L | X | H | L | X | X | X | NA | L to H | Deselect | Hi-Z |
| L | X | H | L | X | X | X | X | NA | L to H | Deselect | Hi-Z |
| L | X | H | H | L | X | X | X | NA | L to H | Deselect | Hi-Z |
| L | H | L | L | X | X | X | L | External | L to H | Begin read | Q |
| L | H | L | L | X | X | X | H | External | L to H | Begin read | Hi-Z |
| L | H | L | H | L | X | H | L | External | L to H | Begin read | Q |
| L | H | L | H | L | X | H | H | External | L to H | Begin read | Hi-Z |
| X | X | X | H | H | L | H | L | Next | L to H | Continue read | Q |
| X | X | X | H | H | L | H | H | Next | L to H | Continue read | Hi-Z |
| X | X | X | H | H | H | H | L | Current | L to H | Suspend read | Q |
| X | X | X | H | H | H | H | H | Current | L to H | Suspend read | Hi-Z |
| H | X | X | X | H | L | H | L | Next | L to H | Continue read | Q |
| H | X | X | X | H | L | H | H | Next | L to H | Continue read | Hi-Z |
| H | X | X | X | H | H | H | L | Current | L to H | Suspend read | Q |
| H | X | X | X | H | H | H | H | Current | L to H | Suspend read | Hi-Z |
| L | H | L | H | L | X | L | X | External | L to H | Begin write | $\mathrm{D}^{3}$ |
| X | X | X | H | H | L | L | X | Next | L to H | Continue write | D |
| H | X | X | X | H | L | L | X | Next | L to H | Continue write | D |
| X | X | X | H | H | H | L | X | Current | L to H | Suspend write | D |
| H | X | X | X | H | H | L | X | Current | L to H | Suspend write | D |

$1 \mathrm{X}=$ don't care, $\mathrm{L}=$ low, $\mathrm{H}=$ high
2 For $\overline{\text { WRITE }}$, L means any one or more byte write enable signals ( $\overline{\mathrm{BWa}}$ or $\overline{\mathrm{BWb}}$ ) and $\overline{\mathrm{BWE}}$ are LOW or $\overline{\mathrm{GWE}}$ is LOW. $\overline{\text { WRITE }}=\mathrm{HIGH}$ for all $\overline{\mathrm{BWx}}, \overline{\mathrm{BWE}}$,

3 For write operation following a READ, $\overline{\mathrm{OE}}$ must be high before the input data set up time and held high throughout the input hold time.
4. ZZ pin is always Low.

## Absolute maximum ratings

| Parameter | Symbol | Min | Max | Unit |
| :--- | :---: | :---: | :---: | :---: |
| Power supply voltage relative to GND | $\mathrm{V}_{\mathrm{DD}}, \mathrm{V}_{\mathrm{DDQ}}$ | -0.5 | +4.6 | V |
| Input voltage relative to GND (input pins) | $\mathrm{V}_{\text {IN }}$ | -0.5 | $\mathrm{~V}_{\mathrm{DD}}+0.5$ | V |
| Input voltage relative to GND (I/O pins) | $\mathrm{V}_{\text {IN }}$ | -0.5 | $\mathrm{~V}_{\mathrm{DDQ}}+0.5$ | V |
| Power dissipation | $\mathrm{P}_{\mathrm{d}}$ | - | 1.8 | W |
| Short circuit output current | $\mathrm{I}_{\mathrm{OUT}}$ | - | 20 | mA |
| Storage temperature | $\mathrm{T}_{\text {stg }}$ | -65 | +150 | ${ }^{\circ} \mathrm{C}$ |
| Temperature under bias | $\mathrm{T}_{\text {bias }}$ | -65 | +135 | ${ }^{\circ} \mathrm{C}$ |

Stresses greater than those listed under "Absolute maximum ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions may affect reliability.

Recommended operating conditions at 3.3 V I/O

| Parameter | Symbol | Min | Nominal | Max | Unit |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Supply voltage for inputs | $\mathrm{V}_{\mathrm{DD}}$ | 3.135 | 3.3 | 3.465 | V |
| Supply voltage for I/O | $\mathrm{V}_{\mathrm{DDQ}}$ | 3.135 | 3.3 | 3.465 | V |
| Ground supply | Vss | 0 | 0 | 0 | V |

## Recommended operating conditions at 2.5 V I/O

| Parameter | Symbol | Min | Nominal | Max | Unit |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Supply voltage for inputs | $\mathrm{V}_{\mathrm{DD}}$ | 3.135 | 3.3 | 3.465 | V |
| Supply voltage for I/O | $\mathrm{V}_{\mathrm{DDQ}}$ | 2.375 | 2.5 | 2.625 | V |
| Ground supply | Vss | 0 | 0 | 0 | V |

## DC electrical characteristics for 3.3 V I/O operation

| Parameter | Sym | Conditions | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Input leakage current ${ }^{\dagger}$ | $\left\|\mathrm{I}_{\mathrm{LI}}\right\|$ | $\mathrm{V}_{\mathrm{DD}}=\mathrm{Max}, 0 \mathrm{~V} \leq \mathrm{V}_{\text {IN }} \leq \mathrm{V}_{\mathrm{DD}}$ | -2 | 2 | $\mu \mathrm{A}$ |
| Output leakage current | \| $\mathrm{L}_{\mathrm{LO}} \mid$ | OE $\geq \mathrm{V}_{\text {IH }}, \mathrm{V}_{\text {DD }}=\mathrm{Max}, 0 \mathrm{~V} \leq \mathrm{V}_{\text {OUT }} \leq \mathrm{V}_{\text {DDQ }}$ | -2 | 2 | $\mu \mathrm{A}$ |
| Input high (logic 1) voltage | $\mathrm{V}_{\mathrm{IH}}$ | Address and control pins | 2* | $\mathrm{V}_{\mathrm{DD}}+0.3$ | V |
|  |  | I/O pins | 2* | $\mathrm{V}_{\text {DDQ }}{ }^{+0.3}$ |  |
| Input low (logic 0) voltage | $\mathrm{V}_{\text {IL }}$ | Address and control pins | -0.3** | 0.8 | V |
|  |  | I/O pins | -0.5** | 0.8 |  |
| Output high voltage | $\mathrm{V}_{\mathrm{OH}}$ | $\mathrm{I}_{\mathrm{OH}}=-4 \mathrm{~mA}, \mathrm{~V}_{\mathrm{DDQ}}=3.135 \mathrm{~V}$ | 2.4 | - | V |
| Output low voltage | $\mathrm{V}_{\mathrm{OL}}$ | $\mathrm{I}_{\mathrm{OL}}=8 \mathrm{~mA}, \mathrm{~V}_{\mathrm{DDQ}}=3.465 \mathrm{~V}$ | - | 0.4 | V |

## DC electrical characteristics for $\mathbf{2 . 5 V}$ I/O operation

| Parameter | Sym | Conditions | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Input leakage current ${ }^{\dagger}$ | \| $\mathrm{L}_{\text {LI }}$ \| | $\mathrm{V}_{\mathrm{DD}}=$ Max, $0 \mathrm{~V} \leq \mathrm{V}_{\text {IN }} \leq \mathrm{V}_{\mathrm{DD}}$ | -2 | 2 | $\mu \mathrm{A}$ |
| Output leakage current | \| $\mathrm{I}_{\mathrm{LO}}$ \| | $\mathrm{OE} \geq \mathrm{V}_{\mathrm{IH}}, \mathrm{V}_{\mathrm{DD}}=\mathrm{Max}, 0 \mathrm{~V} \leq \mathrm{V}_{\text {OUT }} \leq \mathrm{V}_{\mathrm{DDQ}}$ | -2 | 2 | $\mu \mathrm{A}$ |
| Input high (logic 1) voltage | $\mathrm{V}_{\mathrm{IH}}$ | Address and control pins | 1.7* | $\mathrm{V}_{\mathrm{DD}}+0.3$ | V |
|  |  | I/O pins | 1.7* | $\mathrm{V}_{\mathrm{DDQ}^{+0.3}}$ | V |
| Input low (logic 0) voltage | $\mathrm{V}_{\text {IL }}$ | Address and control pins | -0.3** | 0.7 | V |
|  |  | I/O pins | -0.3** | 0.7 | V |
| Output high voltage | $\mathrm{V}_{\mathrm{OH}}$ | $\mathrm{I}_{\mathrm{OH}}=-4 \mathrm{~mA}, \mathrm{~V}_{\mathrm{DDQ}}=2.375 \mathrm{~V}$ | 1.7 | - | V |
| Output low voltage | $\mathrm{V}_{\text {OL }}$ | $\mathrm{I}_{\mathrm{OL}}=8 \mathrm{~mA}, \mathrm{~V}_{\mathrm{DDQ}}=2.625 \mathrm{~V}$ | - | 0.7 | V |

$\dagger \overline{\mathrm{LBO}}$ and ZZ pins have an internal pull-up or pull-down, and input leakage $= \pm 10 \mu \mathrm{~A}$.
${ }^{*} \mathrm{~V}_{\mathrm{IH}}$ max $<\mathrm{VDD}+1.5 \mathrm{~V}$ for pulse width less than $0.2 \mathrm{X}_{\mathrm{CYC}}$
${ }^{* *} \mathrm{~V}_{\mathrm{IL}} \min =-1.5$ for pulse width less than $0.2 \mathrm{Xt}_{\mathrm{CYC}}$

## $I_{\text {DD }}$ operating conditions and maximum limits

| Parameter | Sym | Conditions | -200 | -166 | -133 | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

1 See "Notes" on page 16.

## Snooze Mode Electrical Characteristics

| Description | Conditions | Symbol | Min | Max | Units |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Current during Snooze Mode | $\mathrm{ZZ} \geq \mathrm{V}_{\mathrm{IH}}$ | $\mathrm{I}_{\mathrm{SB} 2}$ |  | 30 | mA |
| ZZ active to input ignored |  | $\mathrm{t}_{\mathrm{PDS}}$ | 2 |  | cycle |
| ZZ inactive to input sampled |  | $\mathrm{t}_{\mathrm{PUS}}$ | 2 |  | cycle |
| ZZ active to SNOOZE current |  | $\mathrm{t}_{\mathrm{ZZI}}$ |  | 2 | cycle |
| ZZ inactive to exit SNOOZE current |  | $\mathrm{t}_{\text {RZZI }}$ | 0 |  |  |

## Key to switching waveforms

$\square$ Rising input $\square$ Falling input $\square$ don't care $\square \times \infty$ Undefined

Timing waveform of read cycle

Note: $\mathrm{Y}=\mathrm{XOR}$ when $\overline{\mathrm{LBO}}=$ high/no connect; $\mathrm{Y}=\mathrm{ADD}$ when $\overline{\mathrm{LBO}}=$ low. $\overline{\mathrm{BW}[\mathrm{a}: \mathrm{d}]}$ is don't care.

## Timing waveform of write cycle

Note: $\mathrm{Y}=\mathrm{XOR}$ when $\overline{\mathrm{LBO}}=$ high/no connect; $\mathrm{Y}=\mathrm{ADD}$ when $\overline{\mathrm{LBO}}=$ low.

Timing waveform of read/write cycle ( $\overline{\text { ADSP }}$ Controlled; $\overline{\text { ADSC High) }}$

Note: $\mathrm{Y}=\mathrm{XOR}$ when $\overline{\mathrm{LBO}}=$ high/no connect; $;$ Y $=\mathrm{ADD}$ when $\overline{\mathrm{LBO}}=$ low.

Timing waveform of read/write cycle ( $\overline{\text { ADSC }}$ controlled, $\overline{\mathrm{ADSP}}=\mathbf{H I G H}$ )

Timing waveform of power down cycle

## AC test conditions

- Output load: see Figure B, except for $\mathrm{t}_{\mathrm{LZC}}, \mathrm{t}_{\mathrm{LZOE}}, \mathrm{t}_{\mathrm{HZOE}}, \mathrm{t}_{\mathrm{HZC}}$, see Figure C.
- Input pulse level: GND to 3V. See Figure A.
- Input rise and fall time (measured at 0.3 V and 2.7 V ): 2 ns . See Figure A.
- Input and output timing reference levels: 1.5 V .

Figure A: Input waveform

Figure B: Output load (A)

## Thevenin equivalent:

Figure C: Output load (B)

## Notes

For test conditions, see $A C$ Test Conditions, Figures A, B, C.
2 This parameter measured with output load condition in Figure C.
3 This parameter is sampled, but not $100 \%$ tested.
$4 \mathrm{t}_{\mathrm{HZOE}}$ is less than $\mathrm{t}_{\text {LZOE }}$; and $\mathrm{t}_{\mathrm{HZC}}$ is less than $\mathrm{t}_{\mathrm{LZC}}$ at any given temperature and voltage.
5 tCH measured as HIGH above VIH and tCL measured as LOW below VIL.
6 This is a synchronous device. All addresses must meet the specified setup and hold times for all rising edges of CLK. All other synchronous inputs must meet the setup and hold times for all rising edges of CLK when chip is enabled.
7 Write refers to $\overline{\mathrm{GWE}}, \overline{\mathrm{BWE}}, \overline{\mathrm{BW}}[\mathrm{a}, \mathrm{b}]$.
8 Chip select refers to $\overline{\mathrm{CE} 0}, \mathrm{CE} 1, \overline{\mathrm{CE} 2}$

## Package Dimensions

100-pin quad flat pack (TQFP)

|  | TQFP |  |
| :---: | :---: | :---: |
|  | Min | Max |
| A1 | 0.05 | 0.15 |
| A2 | 1.35 | 1.45 |
| b | 0.22 | 0.38 |
| c | 0.09 | 0.20 |
| D | 13.90 | 14.10 |
| E | 19.90 | 20.10 |
| e | 0.65 nominal |  |
| Hd | 15.85 | 16.15 |
| He | 21.80 | 22.20 |
| L | 0.45 |  |
| L1 | 1.00 nominal |  |
| $\alpha$ | $0^{\circ}$ |  |
| Dimensions in millimeters |  |  |

Ordering information

| Package | Width | $\mathbf{- 2 0 0}$ | $\mathbf{- 1 6 6}$ | $\mathbf{- 1 3 3}$ |
