

FEATURES

- Vcc operation voltage : 2.7V ~ 3.6V
- Very low power consumption :
 - Vcc = 3.0V C-grade: 45mA (@55ns) operating current
 - I -grade: 46mA (@55ns) operating current
 - C-grade: 36mA (@70ns) operating current
 - I -grade: 37mA (@70ns) operating current
 - 3.0uA (Typ.) CMOS standby current
- High speed access time :
 - 55 55ns
 - 70 70ns
- Automatic power down when chip is deselected
- Three state outputs and TTL compatible
- Fully static operation
- Data retention supply voltage as low as 1.5V
- Easy expansion with CE1, CE2 and OE options

GENERAL DESCRIPTION

The BS62LV1603 is a high performance , very low power CMOS Static Random Access Memory organized as 2048K words by 8 bits and operates from a range of 2.7V to 3.6V supply voltage. Advanced CMOS technology and circuit techniques provide both high speed and low power features with a typical CMOS standby current of 3.0uA at 3.0V/25°C and maximum access time of 55ns at 3.0V/85°C. Easy memory expansion is provided by an active LOW chip enable ($\overline{CE1}$) , an active HIGH chip enable (CE2) and active LOW output enable (\overline{OE}) and three-state output drivers. The BS62LV1603 has an automatic power down feature, reducing the power consumption significantly when chip is deselected. The BS62LV1603 is available in 48B BGA and 44L TSOP2 packages.

■ PIN DESCRIPTIONS

Name	Function
A0-A20 Address Input	These 21 address inputs select one of the 2048K x 8-bit words in the RAM
$\overline{CE1}$ Chip Enable 1 Input CE2 Chip Enable 2 Input	$\overline{CE1}$ is active LOW and CE2 is active HIGH. Both chip enables must be active when data read from or write to the device. If either chip enable is not active, the device is deselected and is in a standby power mode. The DQ pins will be in the high impedance state when the device is deselected.
\overline{WE} Write Enable Input	The write enable input is active LOW and controls read and write operations. With the chip selected, when \overline{WE} is HIGH and \overline{OE} is LOW, output data will be present on the DQ pins; when \overline{WE} is LOW, the data present on the DQ pins will be written into the selected memory location.
\overline{OE} Output Enable Input	The output enable input is active LOW. If the output enable is active while the chip is selected and the write enable is inactive, data will be present on the DQ pins and they will be enabled. The DQ pins will be in the high impedance state when \overline{OE} is inactive.
DQ0-DQ7 Data Input/Output Ports	These 8 bi-directional ports are used to read data from or write data into the RAM.

■ SWITCHING WAVEFORMS (WRITE CYCLE)
WRITE CYCLE1⁽¹⁾

WRITE CYCLE2 (1,6)

NOTES:

1. \overline{WE} must be high during address transitions.
2. The internal write time of the memory is defined by the overlap of CE2, $\overline{CE1}$ and \overline{WE} low. All signals must be active to initiate a write and any one signal can terminate a write by going inactive. The data input setup and hold timing should be referenced to the second transition edge of the signal that terminates the write.
3. t_{WR} is measured from the earlier of CE2 going low, or $\overline{CE1}$ or \overline{WE} going high at the end of write cycle.
4. During this period, DQ pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the $\overline{CE2}$ high transition or CE1 low transition occurs simultaneously with the \overline{WE} low transitions or after the \overline{WE} transition, output remain in a high impedance state.
6. \overline{OE} is continuously low ($\overline{OE} = V_{IL}$).
7. D_{OUT} is the same phase of write data of this write cycle.
8. D_{OUT} is the read data of next address.
9. If CE2 is high or $\overline{CE1}$ is low during this period, DQ pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
10. The parameter is guaranteed but not 100% tested.
11. t_{CW} is measured from the later of CE2 going high or $\overline{CE1}$ going low to the end of write.
