

## ENHANCED TYPE II CALLER ID DECODER WITH STUTTER DIAL TONE DETECTOR

NW6006

### FEATURES

- 1200 baud Bell 202 and ITU-T V.23 Frequency Shift Keying (FSK) Demodulation
- Stutter dial tone detection
- Compliant with following specifications:  
Bellcore GR-30-CORE & SR-TSV-002476  
TIA/EIA-716, TIA/EIA-777 Draft  
TIA/EIA PN-4195 Draft  
British Telecom (BT) SIN227 & SIN242  
ETSI ETS 300 778-1 and -2
- Bellcore "CPE Alerting Signal (CAS)", British Telecom "Idle State and Loop State Tone Alert Signal" and ETSI "Dual Tone Alerting Signal (DT-AS)" detection
- Two separate OP amps with adjustable gain for Tip/Ring and Telephone Hybrid connections
- Monitoring of the stop bit for framing error check
- Serial FSK data interface with selectable output of bit stream or 1 byte buffer
- FSK carrier detection
- 3 V or 5 V operation
- Low power CMOS with intelligent powerdown mode
- Operating temperature range: -40 °C to +85 °C
- Packages available:  
NW6006-XS 20 pin SOIC  
(where 'X' is the revision ID)

### DESCRIPTION

The NW6006 device is a single-chip, 3/5 Volt CMOS caller ID with call waiting detection circuit. It can receive signals following Bellcore GR-30-CORE & SR-TSV-002476, BT SIN227 & SIN242, and ETSI ETS 300 788-1/-2 specifications.

The NW6006 provides 1200 baud Bell 202 and ITU-T V.23 FSK demodulation, detection in stutter dial tone mode and CAS/DT-AS detection. Two separate differential input amplifiers allow the device to be connected with both Tip/Ring and Telephone Hybrid receive pair. FSK demodulation is implemented only on Tip/Ring, while DT-AS(or CAS) detection can be on either Tip/Ring or Hybrid Receive. In addition, NW6006 provides a serial FSK data interface via which the data can be selected to be processed as a bit stream or extracted from a 1 byte built-in buffer. An on-chip Stutter Dial Tone Detector is provided to support the voice mail applications.

The device can be used in feature or cordless phones with voice mail for BT Calling Line Identity Presentation (CLIP), CCA CLIP and Bellcore Calling Identity Delivery (CID) systems. It can also be used in caller ID boxes, modem, fax machines, answering machines, database query systems and Computer Telephony Integration (CTI) systems.

### FUNCTIONAL BLOCK DIAGRAM

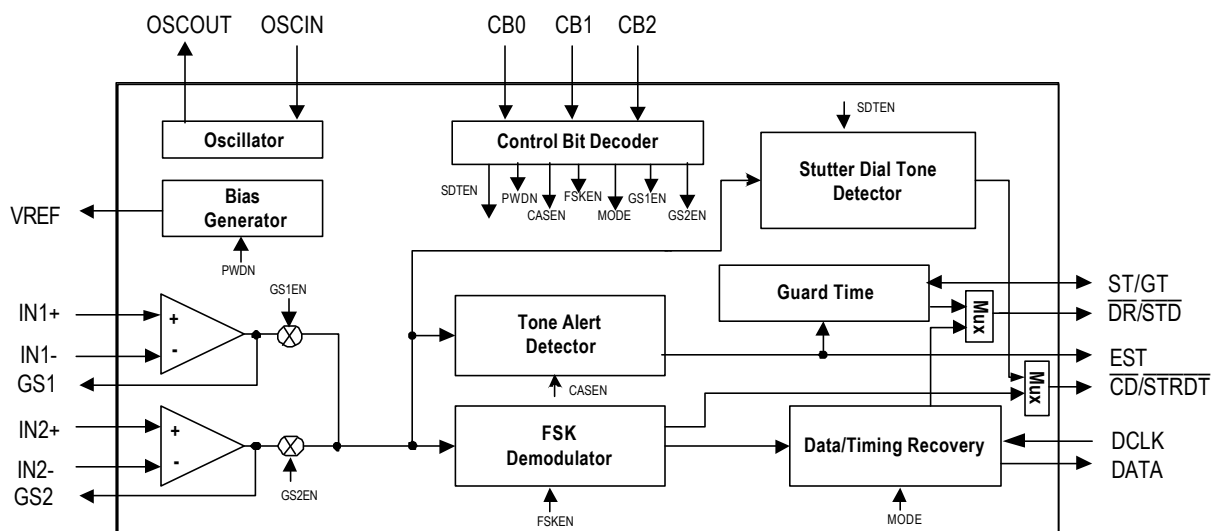

Figure 1. Block Diagram

## PIN INFORMATION

Figure 2. Pin Assignment

Name	Type	Pin No.	Description
VREF	O	1	<b>Reference Voltage.</b> This output is used to bias the input OP amp. It is typically VCC/2.
IN1+	I	2	<b>Non-inverting Input</b> of the gain adjustable <b>Tip/Ring</b> OP amp.
IN1-	I	3	<b>Inverting Input</b> of the gain adjustable <b>Tip/Ring</b> OP amp.
GS1	O	4	<b>Gain Select Output</b> of the gain adjustable <b>Tip/Ring</b> OP amp. The Tip/Ring signal can be attenuated or amplified at GS1 by adjusting the feedback resistor between GS1 and IN1-. The FSK signal is always detected by Tip/Ring OP amp while DT-AS(CAS) signal can be detected by either Tip/Ring or Hybrid OP amp. The OP amp selection is controlled by CB1 and CB2 bits.
GND	-	5	<b>Ground.</b>
OSCIN	I	6	<b>Oscillator Input.</b> A 3.579545 MHz crystal or ceramic resonator should be connected between this pin and the OSCOUT. It can also be driven by an external clock source.
OSCOUT	O	7	<b>Oscillator Output.</b> A 3.579545 MHz crystal or ceramic resonator should be connected between this pin and the OSCIN. When an external clock drives OSCIN, this pin can be left floating.
CB0	I	8	<b>Control Bit 0</b> (FSK Data Interface Mode Select). This pin can select the 3-wire FSK data interface mode. A '0' on this pin indicates interface mode 0; while a '1' on this pin indicates interface mode 1. (The FSK data interface is consisted of DATA, DCLK and $\overline{DR/STD}$ pins.) When CB0 is high and CB1, CB2 are both low, the device is set into the power down state.
DCLK	I/NC	9	<b>Data Clock of the Serial FSK Interface.</b> In mode 0 (CB0 is low), this pin is unused; In mode 1 (CB0 is high), this pin is an input which clock the FSK data byte out to the DATA pin.
DATA	O	10	<b>Data Output of the Serial FSK Interface.</b> In mode 0 (CB0 is low), the FSK serial bit stream is output to the DATA pin directly. In mode 1 (CB0 is high), the start bit is stripped off, the data byte and the stop bit is stored in a 9-bit buffer. At the end of each word signaled by the $\overline{DR/STD}$ pin, the microcontroller should shift the byte out onto the DATA pin by applying 8 read pulses to the DCLK pin. A 9 <sup>th</sup> DCLK pulse will shift out the stop bit for framing error checking.

## PIN INFORMATION (CONTINUED)

Name	Type	Pin No.	Description
$\overline{DR}/\overline{STD}$	O/NC	11	<b>Data Ready or DT-AS Detection Delayed Steering Output.</b> This pin is active low. When FSK demodulation is enabled, this pin is the Data Ready output. In FSK interface mode 0, this pin is unused and reads '1'. While in mode 1, this pin is normally high and goes low for half a bit time at the end of a word. If DCLK starts during $\overline{DR}$ low, the first rising edge of the DCLK input will return $\overline{DR}$ to high. In this way, reading of the first DATA bit can clear the interrupt requested by a low going $\overline{DR}$ . When DT-AS detection is enabled, this pin is the Delayed Steering Output. An active low signal on this output indicates the detection of a 'guard time qualified' DT-AS.
EST	O	12	<b>DT-AS Early Steering Output.</b> This pin is an active high output to indicate the detection of a raw DT-AS signal. It is used with the ST/GT pin and external components to time qualify the detection.
ST/GT	I/O	13	<b>DT-AS Detection Steering Input/Guard Time Output.</b> It's a CMOS output and an input of voltage comparator. It is used in conjunction with the EST pin and external components to time qualify a raw DT-AS signal detection. If the voltage at this pin is greater than the voltage threshold, $\overline{DR}/\overline{STD}$ pin is asserted low to indicate that a DT-AS has been detected. A voltage less than the threshold enable the device to accept a new DT-AS and return the $\overline{DR}/\overline{STD}$ pin to high.
$\overline{CD}/\overline{STRDT}$	O	14	<b>FSK Carrier Detector or Stutter Dial Tone Detector Output.</b> This is an active low CMOS output signal to indicate the presence of in-band FSK signal or valid Stutter Dial Tone signal.
VCC	-	15	<b>3/5 V Power Supply.</b>
CB1	I	16	<b>Control Bit 1 (Function Select 1).</b> This pin is used with CB2 to select FSK demodulation, Tip/Ring DT-AS/Dial Tone detection, Hybrid DT-AS/Dial Tone detection with or without Stutter Dial Tone Detection. See Table 1. When CB0 is high, CB1 and CB2 pins are both low, the device is set into the power down state.
CB2	I	17	<b>Control Bit 2 (Function Select 0).</b> This pin is used with CB2 to select FSK demodulation, Tip/Ring DT-AS/Dial Tone detection, Hybrid DT-AS/Dial Tone detection with or without Stutter Dial Tone Detection. See Table 1. When CB0 is high, CB1 and CB2 pins are both low, the device is set into the power down state.
GS2	O	18	<b>Gain Select Output</b> of the gain adjustable Hybrid OP amp. The hybrid receive signal can be amplified or attenuated at GS2 by adjusting the feedback resistor between GS2 and IN2-. When the CPE is off-hook, DT-AS detection of the GS2 signal should be enabled via the CB1 and CB2 pins.
IN2-	I	19	<b>Inverting Input</b> of the gain adjustable Hybrid OP amp.
IN2+	I	20	<b>Non-inverting Input</b> of the gain adjustable Hybrid OP amp.

### Abbreviation Index

CAS	-----	CPE Alerting Signal
CDS	-----	Caller Display Service
CID	-----	Calling Identity Delivery
CIDCW	-----	Calling Identity Delivery on Call Waiting
CLIP	-----	Calling Line Identity Presentation
CNAM	-----	Calling Name Delivery
CND	-----	Calling Number Delivery
CNIC	-----	Calling Number Identification Circuit
CO	-----	Central Office
DT-AS	-----	Dual Tone Alert Signal
MEI	-----	Multiple Extension Interworking
SDT	-----	Stutter Dial Tone
TE	-----	Terminal Equipment

## PIN INFORMATION (CONTINUED)

Table 1. Description of Control Bit Pins CB0-2

Pin	Name	Description		
CB0	FSK Data Interface Mode Select	0 1	FSK Data Interface Mode 0: FSK bit stream is output directly. FSK Data Interface Mode 1: FSK byte is stored in a 1-byte buffer, which can be read serially by the microcontroller.	
CB1 CB2	Function Select 1 Function Select 0	CB1 1	CB2 1	FSK Demodulation is enabled. Tip/Ring input (GS1) is selected. In FSK Demodulation (CB0 = '1'), $\overline{DR}/\overline{STD}$ is $\overline{DR}$ .
		1	0	Hybrid DT-AS Detection is enabled. Hybrid Receive input (GS2) is selected. $\overline{DR}/\overline{STD}$ is $\overline{STD}$ . When CB0 is high ('1'): Stutter Dial Tone Detection is enabled. $\overline{CD}/\overline{STRDT}$ is $\overline{STRDT}$ . When CB0 is low ('0'): Stutter Dial Tone Detection is disabled. $\overline{CD}/\overline{STRDT}$ is $\overline{CD}$ .
		0	1	Tip/Ring DT-AS Detection is enabled. Tip/Ring input (GS1) is selected. $\overline{DR}/\overline{STD}$ is $\overline{STD}$ . When CB0 is high ('1'): Stutter Dial Tone Detection is enabled. $\overline{CD}/\overline{STRDT}$ is $\overline{STRDT}$ . When CB0 is low ('0'): Stutter Dial Tone Detection is disabled. $\overline{CD}/\overline{STRDT}$ is $\overline{CD}$ . Tip/Ring DT-AS detection is required for Bellcore MEI and BT on-hook CLIP.
		0	0	When CB0 is high ('1'): the NW6006 will be powered down. It draws minimal power supply current. When CB0 is low ('0'): for factory testing only.

## FUNCTIONAL DESCRIPTION

### CALLER ID SPECS SUPPORTED

The NW6006 is a type II Caller ID device with Call Waiting capability. It supports Bellcore, BT and ETSI specifications. The major differences between above specs are as follows (see Fig. 11, Fig. 12 and Fig. 13 for reference):

#### BELLCORE AND TIA

Bellcore GR-30-CORE and SR-TSV-002476 define the requirement for the signalling services of Calling Number Delivery (CND), Calling Name Delivery (CNAM), VMWI (Visual Message Waiting Indicator) and Calling Identity Delivery on Call Waiting (CIDCW).

In CND or CNAM service, information of the calling party is embedded in the silent interval between the first and second ringing. The NW6006 can detect and demodulate the incoming Bell-202 FSK data. In CIDCW service, information about an incoming caller is sent to the subscriber who is engaged in another call. A CPE Alerting Signal (CAS) indicates that a CIDCW data is incoming. The NW6006 can detect the alerting signal and demodulate the incoming FSK information which contains CIDCW data. The demodulated data is output onto the serial interface.

In North America, Telecommunications Industry Association (TIA)

also defines standards. TIA specification TIA/EIA-716 defines Type I CPE requirements. A type II CPE specification document is drafted as TIA/EIA-777.

#### BRITISH TELECOM

BT SIN227 and SIN242 define the signal interface between the Central Office (CO) and the Terminal Equipment (TE) for the Caller Display Service (CDS). CDS provides CLIP (Calling Line Identity Presentation) that delivers to an idle state (on hook) TE the identity of an incoming caller before the first ring.

A polarity reversal on the A and B wires indicates the arrival of a CDS call. After that comes an Idle State Tone Alert Signal, and then Caller ID FSK information transmitted in ITU-T V.23 format. When the subscriber is engaged in a call, the arrival of information about another incoming call is indicated by a Loop State Tone Alert Signal. The NW6006 can detect tone alert signal and demodulate the incoming ITU-T V.23 FSK signals.

#### ETSI

The ETSI caller identity specifications ETS 300 788-1 for on-hook and ETS 300 788-2 for off-hook define the requirements for CPE, while ETS 300 659-1 for on-hook and ETS 300 659-2 for off-hook define the end office requirements. The services such as CLIP and CLIP with Call Waiting in ETSI specifications are similar to those of Bellcore. The ETSI specifications are popularly used in Europe.

## DT-AS DETECTION ON EITHER TIP/RING OR HYBRID RECEIVE PAIR

In off-hook services, the detection of Dual Tone Alert Signal (DT-AS) will affect the quality of the call waiting service. Even though the end office has muted the far end party before and after it sends DT-AS, the near end user who is to receive the FSK information may be still talking. Therefore, the CPE must be able to detect DT-AS successfully in the presence of near end speech. Furthermore, imitation of DT-AS by speech will also affect the DT-AS detector, thus false detection may be generated.

To achieve better DT-AS detection quality, a method is to put DT-AS detection on the telephone hybrid receive pair instead of on Tip/Ring. As the near end speech has been attenuated while the DT-AS level is the same as on Tip/Ring, the DT-AS immunity is improved.

A CPE capability called Multiple Extension Interworking, in process of being defined by Bellcore, requests the CPE be capable of detecting DT-AS when the line is off-hook, although the CPE itself may be on-hook. Under some conditions, an on-hook CPE may send an acknowledgment to the end office. Also, the on-hook CPE's capability of detecting DT-AS enables the call logs between on and off-hook CPEs to be maintained synchronous. In this way, when all off-hook CPEs are MEI compatible and DT-AS is received, one of the CPEs will send the acknowledgment signal and all CPEs will receive FSK.

Therefore, if the DT-AS detector is connected only to the hybrid receive pair, the CPE can not detect DT-AS when it is on-hook. When the CPE is on-hook, either the hybrid is non-functional or the signal level is severely attenuated. Thus, an on-hook CPE must be able to detect DT-AS from Tip/Ring.

The NW6006 provides two input OP amps via which the device can be connected both to Tip/Ring and to the Hybrid Receive pairs. Both connection can be differential or single-ended. FSK demodulation is implemented only on Tip/Ring, while DT-AS detection can be on either Tip/Ring or Hybrid Receive. Tip/Ring DT-AS detection is required for MEI and BT's on-hook CLIP.

It should be noted here that as the Hybrid OP amp is for DT-AS detection only, its gain can always be adjusted specifically for the DT-AS signal.

## STUTTER DIAL TONE SPECS SUPPORTED

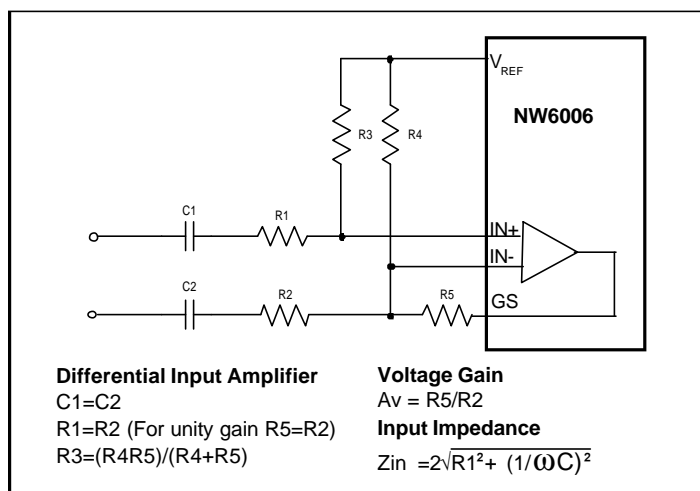

The NW6006 also supports TIA/EIA Stutter Dial Tone specification PN-4159 Draft. This specification defines the requirement for the singalling of Stutter Dial Tone (SDT). When there is a message waiting in a customer's voicemail box, the serving telephone company's Central Office (CO) switch may apply a SDT signal to the customer's line when it is taken off-hook. An SDT CPE is used to automatically detect the SDT in response to an on-hook to off-hook transition and provide an indication.

## BLOCK DESCRIPTION

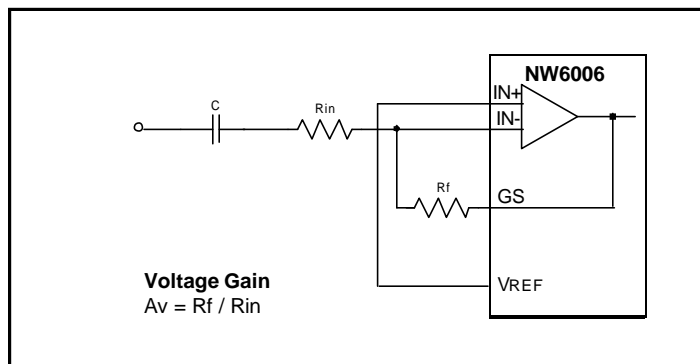

The NW6006 requires a 3.579545 MHz system clock and consists of four major functional blocks: Analog Input Circuit, Dual Tone Alert Signal Detection, Stutter Dial Tone Detection and FSK Demodulation.

### ANALOG INPUT CIRCUIT

The input signal is processed by the Analog Input Circuit block, which is comprised of two OP amps and a bias source (VREF). VREF is the output of a low impedance voltage source used to bias the input OP amp, and is typically equal to VCC/2. The Tip/Ring OP amp (IN1+, IN1-, GS1 pins) is for connecting to Tip and Ring, while the Hybrid OP amp (IN2+, IN2-, GS2 pins) is for connecting to Hybrid Receive Pair. The gain adjustable OP amps are also used to select the input gain by connecting a feedback resistor between GS and the IN- pin. Fig. 3 shows the differential input configuration. In single-ended configuration, the gain adjustable OP amp is connected as shown in Fig. 4.

**Figure 3. Differential Input Gain Control Circuit**

**Figure 4. Single-ended Input Gain Control Circuit**

## DUAL TONE ALERT SIGNAL DETECTION

The Dual Tone Alert Signal is used only in off-hook signalling in Bellcore system and ETSI system, but in BT system it is used in both on and off-hook signalling. The low and high tone frequencies of three different systems are as follows:

	BT	Bellcore & ETSI
Low Tone Frequency	2130 Hz $\pm$ 1.1% (on-hook) 2130 Hz $\pm$ 0.6% (off-hook)	2130 Hz $\pm$ 0.5%
High Tone Frequency	2750 Hz $\pm$ 1.1% (on-hook) 2750 Hz $\pm$ 0.6% (off-hook)	2750 Hz $\pm$ 0.5%

When the device selects DT-AS detection, the bi-purpose output pin  $\overline{\text{DR/STD}}$  is  $\overline{\text{STD}}$ .  $\overline{\text{STD}}$  goes low when DT-AS has been detected and return high after DT-AS has ended.

The incoming Alert Signal goes through anti-alias filter and then is separated into high band and low band by two bandpass filters. The tone detection algorithm examines the filter outputs to validate the arrival of the DT-AS. The EST pin becomes active when both tones are detected. The EST is only the preliminary indication, it must be qualified by the "guard time" as required by Bellcore, BT and ETSI (a minimum duration for valid signals).  $\overline{\text{STD}}$  is the guard time qualified DT-AS detection output, it indicates the correct detection.

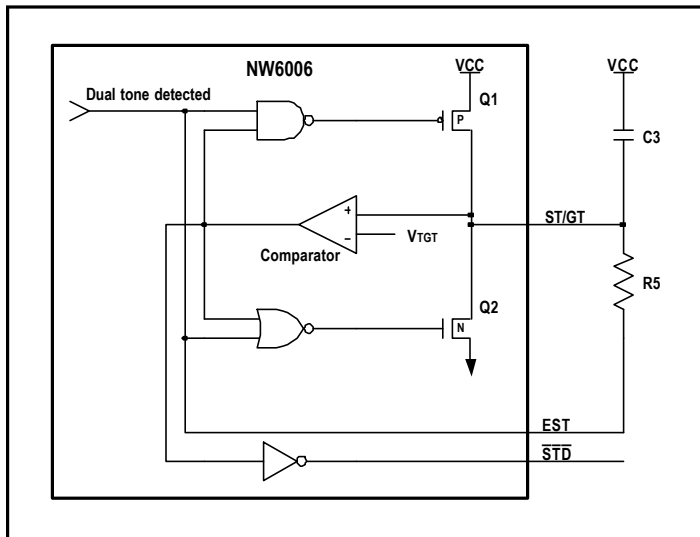

Figure 5. Guard Time Circuit of Dual Tone Alert Signal Detection

Fig. 5 shows the operation of the guard time circuit and Fig. 6 shows the waveform of the EST, ST/GT and  $\overline{\text{STD}}$  pins. The total recognition time is  $t_{\text{REC}} = t_{\text{DP}} + t_{\text{GP}}$ , where  $t_{\text{DP}}$  is the tone present detection time and  $t_{\text{GP}}$  is the tone present guard time. The total absent time is  $t_{\text{ABS}} = t_{\text{DA}} + t_{\text{GA}}$ , where  $t_{\text{DA}}$  is the tone absent detection time and  $t_{\text{GA}}$  is the tone absent guard time. The guard time is the RC time constant for the capacitor charge to VCC or discharge to GND. To get the unequal present and absent guard time, a diode can be connected as shown in Fig. 7 to provide different RC time constant (varying resistance value) during charging and discharging.

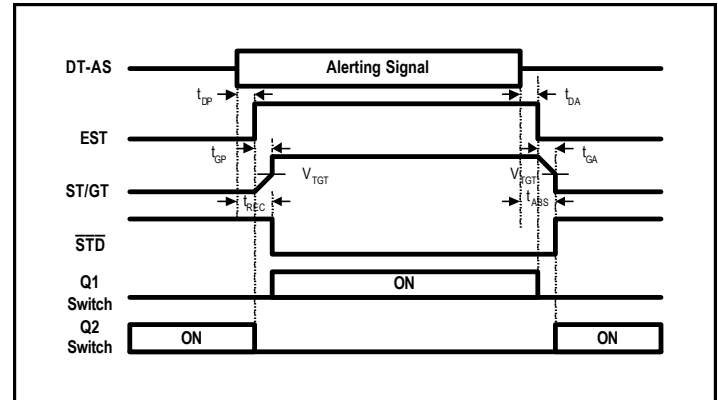

Figure 6. Guard Time Waveform

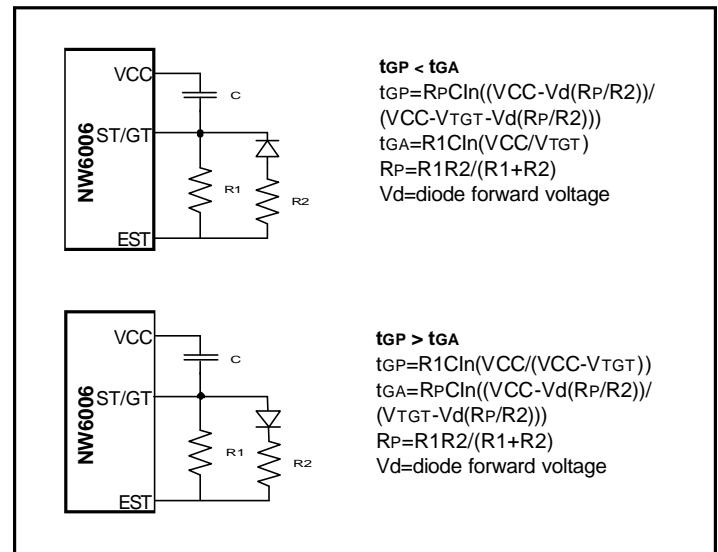

Figure 7. Guard Time Circuits with Unequal Present and Absent Times

## FSK DEMODULATION

The key part among the functions offered by NW6006 is FSK demodulation. This function is implemented by several stages: first, the carrier detector provides an indication of the presence of signal at the bandpass filter output; second, the device's dual mode serial interface allows convenient extraction of the 8-bit data words in the demodulated FSK bit stream.

The FSK characteristics are different in BT, ETSI and Bellcore specifications. The signal frequencies in BT and ETSI correspond to ITU-T V.23; the Bellcore frequencies correspond to Bell 202. The NW6006 is compatible with both formats. It also meets the signal characteristics by setting the Tip/Ring input OP amp at unity gain in 5V operation.

	ITU-T V.23	Bell 202
Mark Freq. ('1')	1300 Hz $\pm$ 1.5%	1200 Hz $\pm$ 1%
Space Freq. ('0')	2100 Hz $\pm$ 1.5%	2200 Hz $\pm$ 1%

For 3 V operation, the FSK receiver becomes easier to accept lower level signals than in 5 V operation. The Tip/Ring input OP amp gain should be reduced to maintain the FSK reject level.

## Serial FSK Interface

The three wire DATA, DCLK and  $\overline{DR}$  form the data interface of the FSK demodulation. The DATA pin is the serial data pin that outputs data to external devices. The DCLK pin is the data clock which is used in Mode '1' and is generated by an external device. The  $\overline{DR}$  pin is the data ready signal used in Mode '1', also an output from the NW6006 to external devices.  $\overline{DR}/\overline{STD}$  pin is a dual purpose output pin, when FSK function is selected it is  $\overline{DR}$ .

Two modes are selectable via control of the device's CB0 pin: Mode '0' (CB0 is low), where the FSK bit stream is output directly; Mode '1' (CB0 is high), where the data byte and the stop bit are stored in a 9 bit buffer.

### Mode '0' (CB0 is low)

In this mode, the device demodulates the incoming FSK signal, and output the data directly to the DATA pin. DCLK and  $\overline{DR}$  pins are unused. Fig. 19 and Fig. 20 show the timing diagram of Mode '0' operation.

### Mode '1' (CB0 is high)

In this mode, the received byte is stored on chip. The microcontroller supplies read pulses (DCLK) to shift the register contents serially out of the NW6006, onto the DATA pin. The NW6006 asserts  $\overline{DR}$  to denote the word boundary and indicate to the microprocessor that a new word has become available. Internal to the device, the demodulated data bits are sampled and stored. Midway through the stop bit, the 8 data bits and the stop bit are parallel loaded into a 9-bit shift register and  $\overline{DR}$  goes low. The contents of register are shifted out to DATA pin on DCLK's rising edge with LSB (Least Significant Bit) out first. If DCLK begins while  $\overline{DR}$  is low,  $\overline{DR}$  will return to high upon the first DCLK rising edge. This feature allows the

associated interrupt to be cleared by the first read pulse. Otherwise,  $\overline{DR}$  stays low for half a nominal bit time (1/2400 sec) and then returns to high. After the last bit (Most Significant Bit) has been read, additional DCLKs are ignored. Fig. 18 shows the timing diagram of Mode '1' operation.

Reading the stop bit is a method of checking framing errors. If it's certain that there is no framing error would occur, the microcontroller only needs to send 8 DCLK pulses to shift the data byte out. After the checksum byte has been received, all 9 bits should be read and framing error checked.

## STUTTER DIAL TONE DETECTION

In some specifications, Stutter Dial Tone is used to indicate voice mails. The low and high tone frequencies of Stuttered Dial Tone signal are 350 Hz (tolerant range: 343 Hz to 357 Hz) and 440 Hz (tolerant range: 431 Hz to 449 Hz).

When the device selects Stutter Dial Tone detection, the bi-purpose output pin  $\overline{CD}/\overline{STRDT}$  is  $\overline{STRDT}$ .  $\overline{STRDT}$  goes low when dial tone signal has been detected and return high after dial tone signal has been ended (see Fig. 21).

The incoming Stuttered Dial Tone signal goes through anti-alias filter and then is separated into high band and low band by two bandpass filters. The tone detection algorithm examines the filter outputs to validate the arrival of the Stutter Dial Tone signal. An embedded digital algorithm implements guard-time function. If the dial tone signal is qualified by the algorithm, the  $\overline{STRDT}$  pin goes active to indicate a correct detection.

## FSK CARRIER DETECTION

The carrier detector detects the presence of a signal of sufficient amplitude at the output of the FSK bandpass filter. If the signal is qualified by a digital algorithm, it sets the  $\overline{CD}$  output to low indicating a successful carrier detection. NW6006 supplies a 10 ms hysteresis to allow for momentary signal drop out once  $\overline{CD}$  has been activated. When there is no activity at the FSK bandpass filter output for 10 ms,  $\overline{CD}$  is released.

When  $\overline{CD}$  is inactive (high), the raw output of the FSK demodulator is ignored by the FSK data output interface. In mode '0', the DATA pin is forced high. In mode '1', the internal shift register is not updated. If DCLK is clocked, DATA is undefined.

Since signals such as DT-AS, DTMF tones and speech are within the FSK frequency band and thus may activate the carrier detector. The NW6006 should be put into DT-AS or power down mode when FSK is not expected to avoid false carrier detection and false demodulation.

## OTHER FUNCTIONS

### Power-down Mode

The device provides the power-down feature to reduce the power consumption. Power-down can be activated by setting Control Bits 0-2 to '100'. Note that momentary transition of CB0-2 into the power-down code won't activate power-down but will reset the device.

In this mode, both input OP amps, reference voltage and the oscillator are non functional. When the device is in power-down, DATA,  $\overline{DR}/\overline{STD}$ ,  $\overline{CD}/\overline{STRDT}$  are high; EST and ST/GT are low.

An intelligent Power-down feature is implemented to further reduce the operating current. When FSK is selected, DT-AS detector and Stuttered Dial Tone Detection are powered down. When DT-AS and STRDT are selected, FSK demodulator is powered down. The Tip/Ring and Hybrid input OP amps are not affected in the intelligent Power-down.

### Crystal Oscillator

A 3.579545 MHz crystal oscillator or other external clock source is required for NW6005. The crystal can be directly connected between OSCIN and OSCOUT pins without any external component. If an external clock source is used, OSCIN pin should be driven by the clock source and OSCOUT pin is left floating or is used to drive other devices. Fig. 8 shows some applications.

Figure 8. Application of Clock Driven Circuit

## APPLICATION NOTE

### CONTROL BITS PROGRAMMING

Functionality of the NW6006 can be selected by coding CB0-CB2, as shown in Table 2.

Table 2. Control Bits Programming

Functionality Group	CB0	CB1	CB2
FSK Demodulation Mode 0	0	1	1
FSK Demodulation Mode 1	1	1	1
Hybrid DT-AS Detection with Stuttered Dial Tone Detection	1	1	0
Hybrid DT-AS Detection Only	0	1	0
Tip/Ring DT-AS Detection with Stuttered Dial Tone Detection	1	0	1
Tip/Ring DT-AS Detection Only	0	0	1
Power Down	1	0	0
Factory Test Only	0	0	0

### HYBRID CONNECTION

To optimize the device's talkdown and talkoff performance, Hybrid connection is recommended. There are two Op Amps in NW6006 which bring convenience for Hybrid connection. When connected to the Hybrid Op Amp, the Hybrid circuit will attenuate the speech signal at least 9 dB from the microphone to the speaker, which leads a much better performance of near-end talkdown and talkoff.

It is highly recommended to demodulate the FSK signal using the Tip/Ring OP Amp and to detect the CAS signal using the Hybrid OP Amp. This implementation brings not only optimized talkdown and talkoff performance, but also the convenience to adjust FSK and CAS sensitivity separately.

## GAIN SETTING

Ideally, the gain of the two Op Amps would be set to 0 dB. But in real applications, the gain setting should be determined by industry standards as well as by customer requirements. The circuit and calculation method of gain setting is illustrated in Figs. 3 and 4. For Hybrid connection, the single-ended solution (Fig. 4) is often selected.

Typically, the CAS sensitivity should be lower than the FSK sensitivity in order to prevent missing the FSK signal while the CAS signal is detected. Therefore, it is suggested to set the gain of the Op Amp for FSK demodulation 3 dB higher than that of the Op Amp for CAS detection.

## THE DIFFERENCE BETWEEN FSK MODE 0 AND MODE1

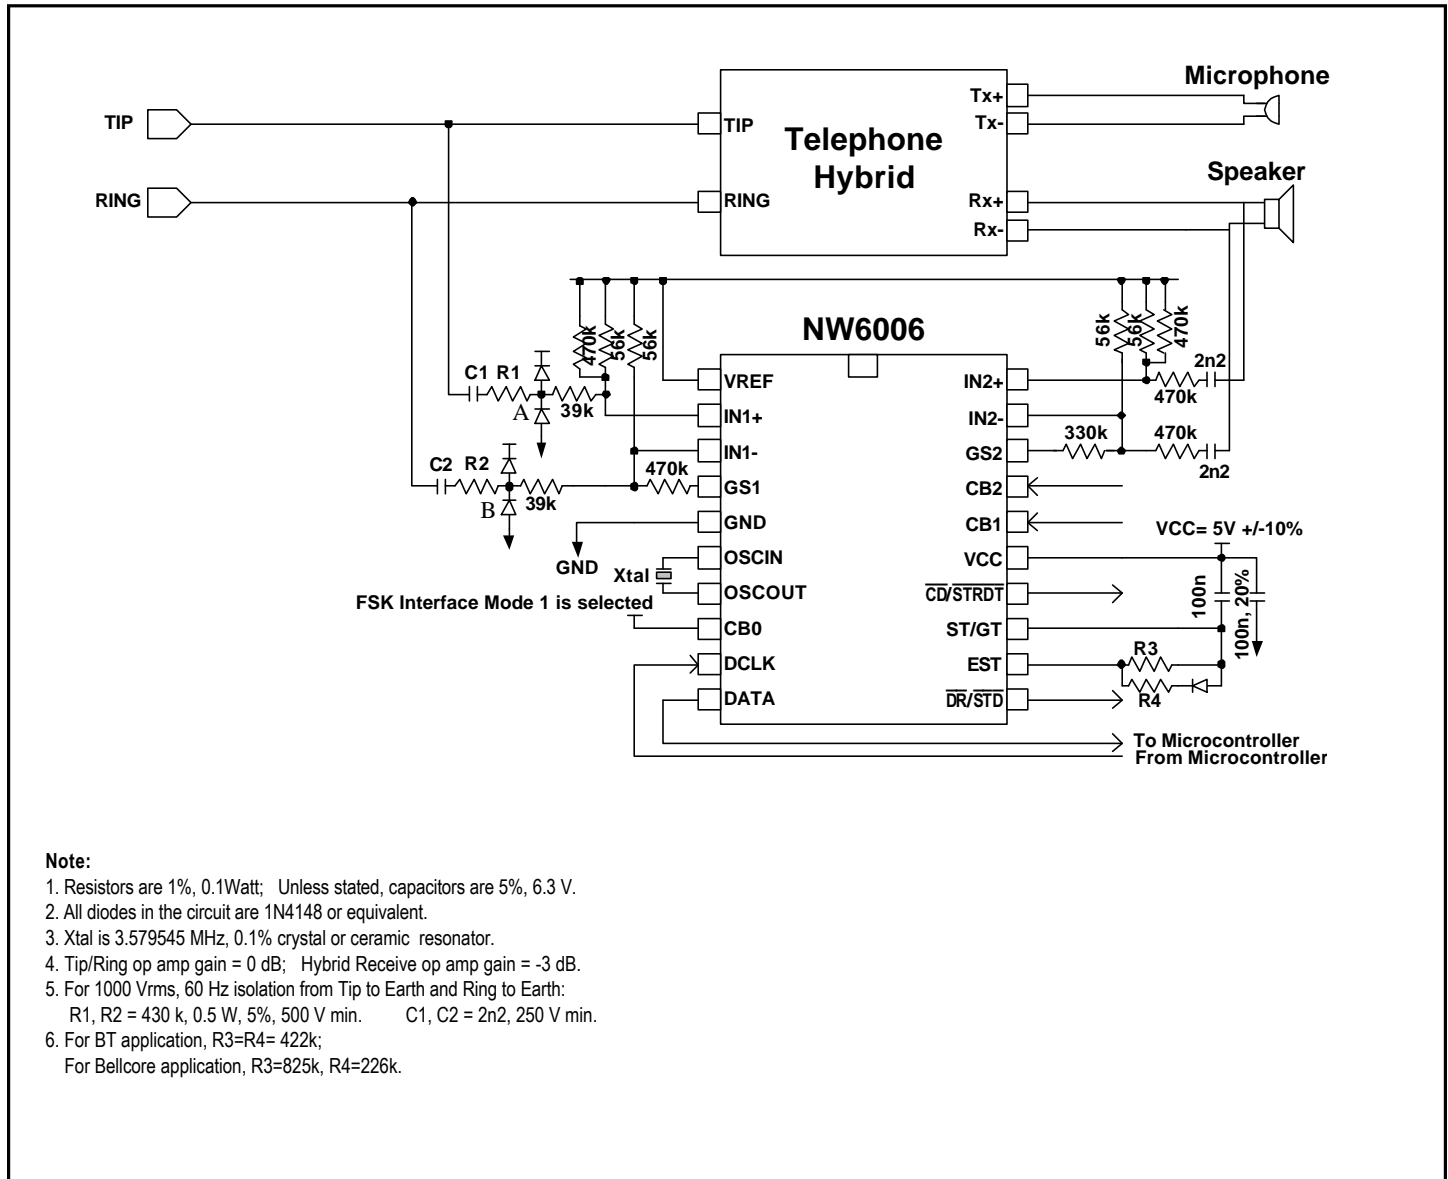

In FSK mode 0, the FSK serial bit stream is output to the DATA pin directly. DCLK and  $\overline{DR}$  pins are unused. The microcontroller reads out the data by the serial data interface which is implemented by software programming. The flexibility of using software improves the immunity to interference.

In FSK mode 1, the received byte is stored in an on-chip register. The microcontroller supplies read pulses (DCLK) to shift the register contents serially out of the NW6006, onto the DATA pin. The  $\overline{DR}$  pin is also used to indicate the word boundary.

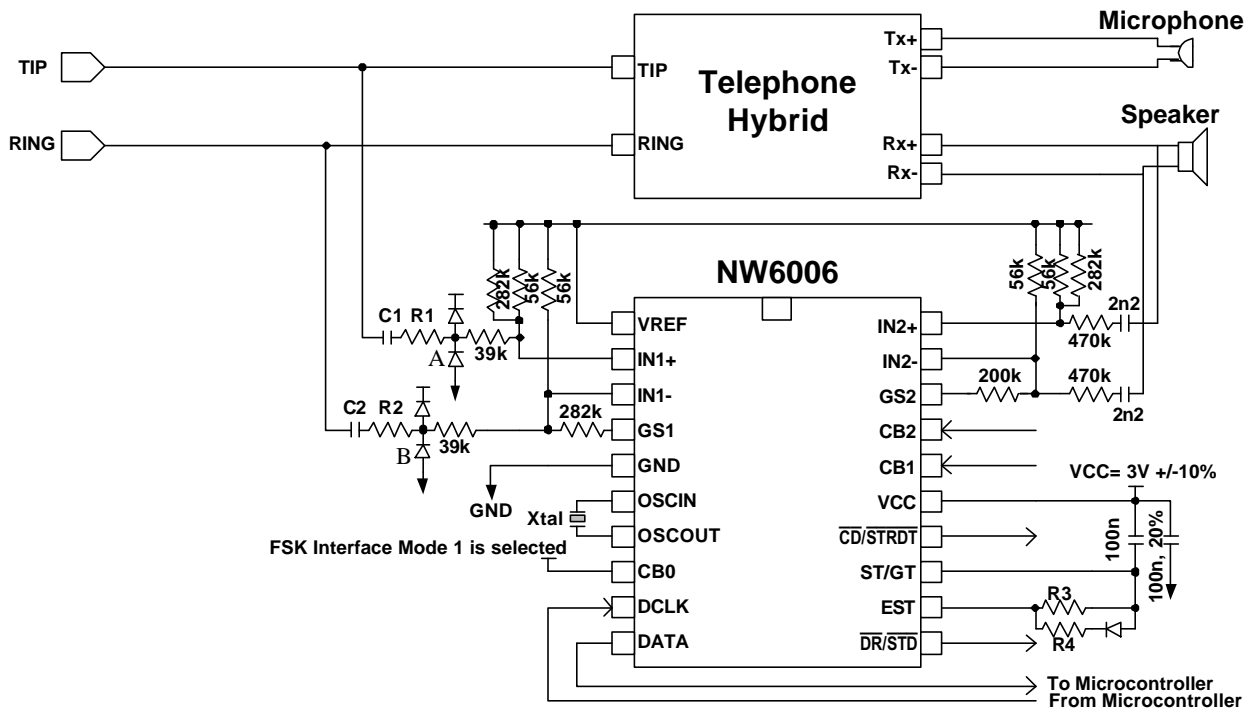

## VALID DT-AS EVALUATION

DT-AS output will generate false detection if being interfered by speech. In this way, valid DT-AS pulse evaluation becomes necessary. The evaluation defines a minimum and maximum pulse duration, and maximum drop out time within that pulse duration. See Figure 22 for reference.

## APPLICATION INFORMATION

**Figure 9. Typical Application Circuit For Bellcore MEI Compatible Type II Telephone  
with Stutter Dial Tone Detection, 5 V Operation**

**Note:**

1. Resistors are 1%, 0.1Watt; Unless stated, capacitors are 5%, 6.3 V.
2. All diodes in the circuit are 1N4148 or equivalent.
3. Xtal is 3.579545 MHz, 0.1% crystal or ceramic resonator.
4. Tip/Ring op amp gain = 0 dB; Hybrid Receive op amp gain = -3 dB.
5. For 1000 Vrms, 60 Hz isolation from Tip to Earth and Ring to Earth:  
R1, R2 = 430 k, 0.5 W, 5%, 500 V min. C1, C2 = 2n2, 250 V min.
6. For BT application, R3=R4= 422k;  
For Bellcore application, R3=825k, R4=226k.

**Figure 10. Typical Application Circuit For Bellcore MEI Compatible Type II Telephone  
with Stutter Dial Tone Detection, 3 V Operation**

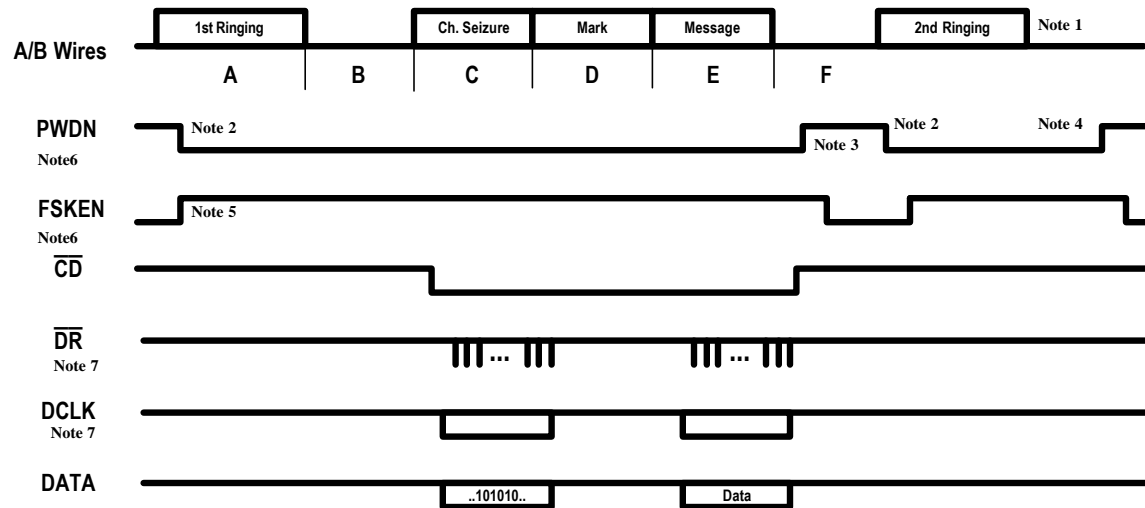

Figure 11. Bellcore On-hook Data Transmission Timing Diagram

**Notes:**

- 1) A= 2 sec typ., B= 250 - 500 ms, C= 250 ms, D= 150ms, E depends on data length, Max C+D+E = 2.9 - 3.7 sec, F ≥ 200 ms.
- 2) In a battery operated CPE, NW6006 may be enabled only after the end of ringing to conserve power.
- 3) The microcontroller in the CPE powers down the NW6006 after  $\overline{CD}$  goes inactive.
- 4) The microcontroller times out if  $\overline{CD}$  is not activated on the 2nd ring and puts the device into Power-down mode.
- 5) FSK may be always enabled while the CPE is on-hook. To prevent the FSK demodulator from reacting to other inband signals such as speech, DT-AS or DTMT tones. The designer may choose to disable FSK during the period that FSK signal is not expected.
- 6) PWDN and FSKEN are internal signals decoded from Control Bits CB2-0.
- 7) When CB0 is low, both  $\overline{DR}$  and DCLK pins are unused.

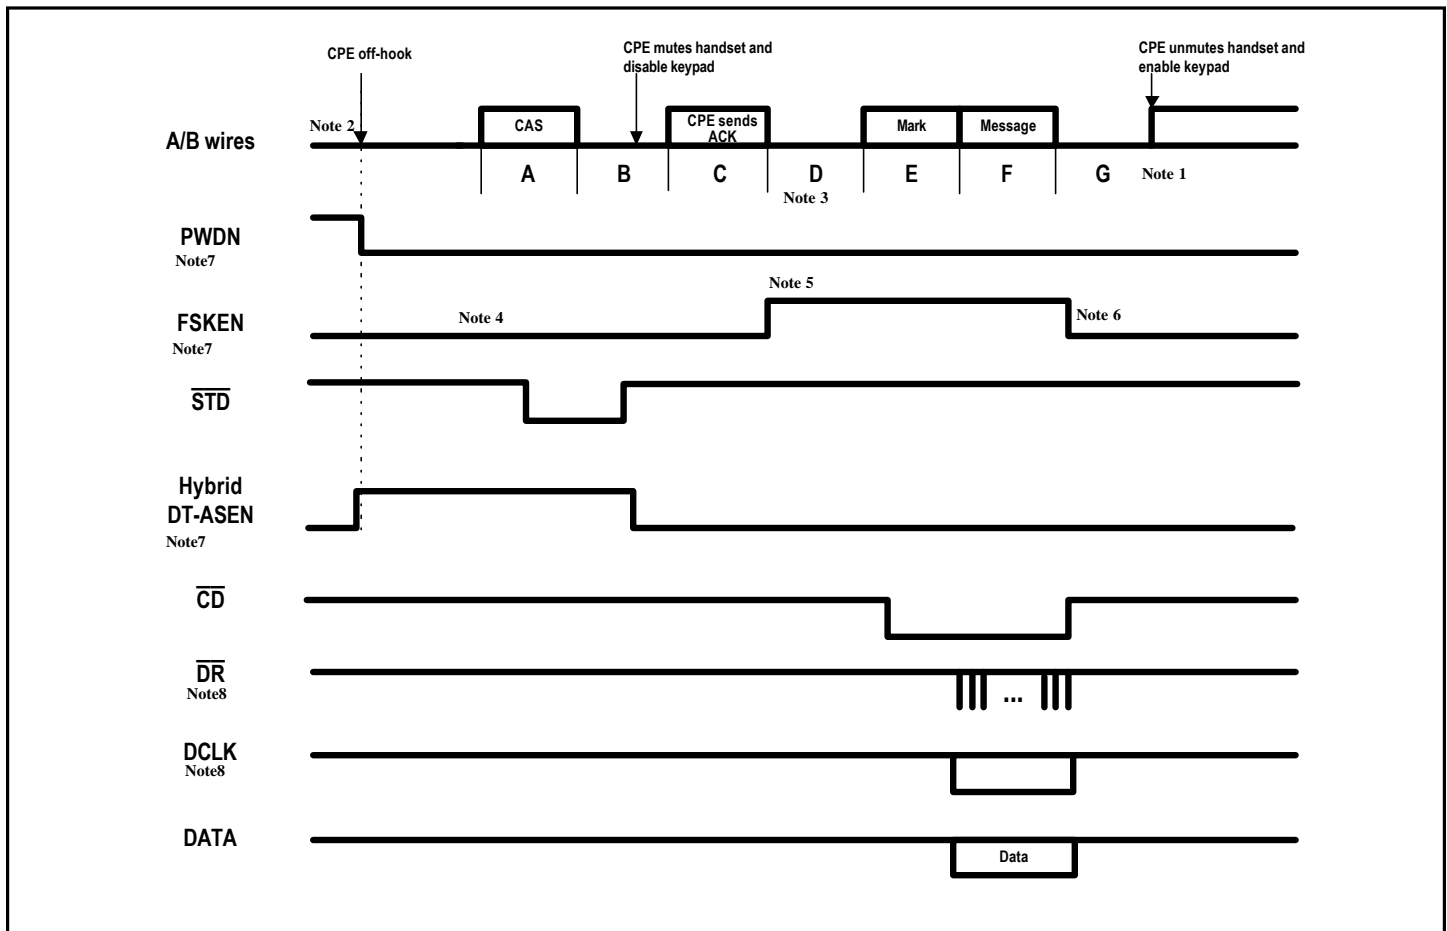

Figure 12. Bellcore Off-hook Data Transmission Timing Diagram

**Notes:**

- 1) A= 75 - 85 ms, B= 0 -100 ms, C= 55 - 65 ms, D= 0 - 500 ms, E= 58 - 75ms, F depends on data length, G≤ 50 ms.
- 2) If AC power is not available, the designer may use the line power when the CPE goes off-hook and use battery power while on-hook. The CPE should also be CID (on-hook) capable.
- 3) If the end office fails to send the FSK signal, the CPE should disable FSKEN and unmute the handset and enable the keypad after this interval.
- 4) When FSK signal is not expected, the FSKEN should be set low to disable the FSK demodulator.
- 5) FSKEN should be high as soon as the CPE has finished sending the acknowledgement signal ACK.
- 6) FSKEN should be low when  $\overline{CD}$  become inactive.
- 7) PWDN, FSKEN and Hybrid DT-ASEN are internal signals decoded from Control Bits CB2-0.
- 8) When CB0 is low, both  $\overline{DR}$  and DCLK pins are unused.

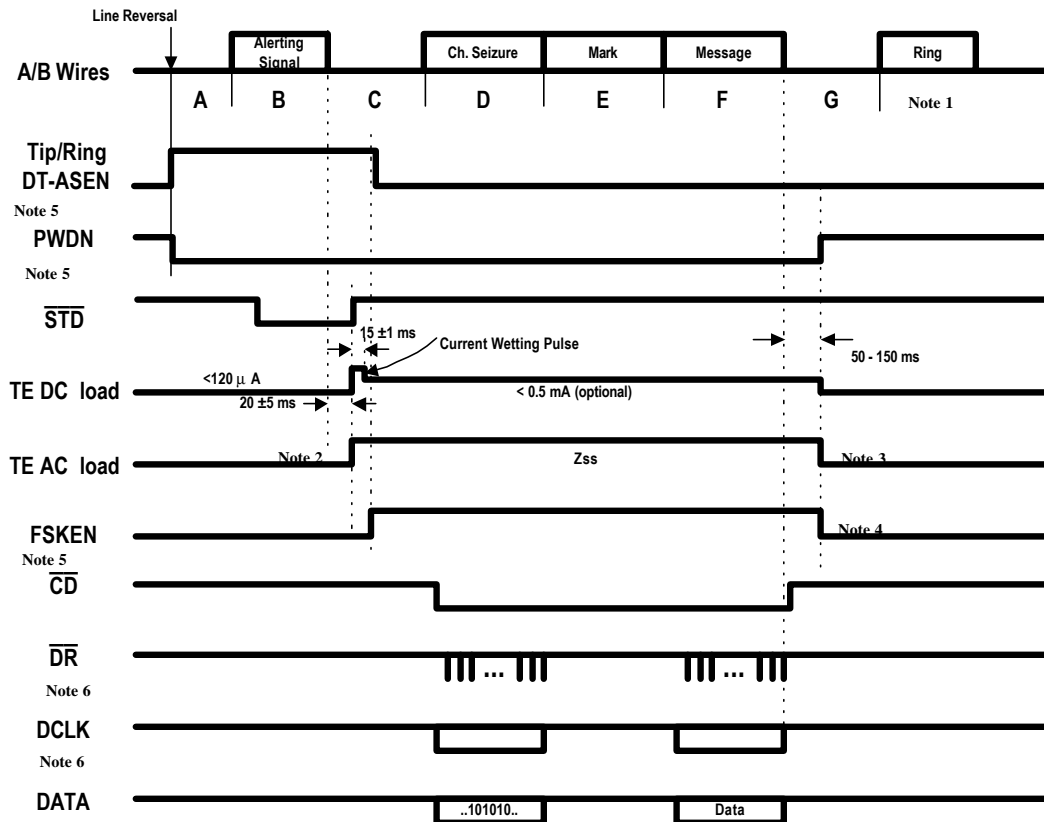

Figure 13. BT Idle State (on-hook) Data Transmission Timing Diagram

Notes:

- 1)  $A \geq 100\text{ms}$ ,  $B=88 - 110\text{ ms}$ ,  $C \geq 45\text{ ms}$  (up to 5 sec),  $D=80 - 262\text{ ms}$ ,  $E=45 - 75\text{ ms}$ ,  $F \leq 2.5\text{ sec}$  (typ. 500 ms),  $G \geq 200\text{ ms}$ .
- 2) By choosing  $t_{GA}=15\text{ ms}$ ,  $t_{ABS}$  will be 15-25 ms (refer to Fig. 8). Current wetting pulse and AC/DC load should be applied right after the  $\overline{\text{STD}}$  rising edge.
- 3) AC and DC loads should be removed between 50-150 ms after the end of the FSK signal. The NW6006 may go to power down mode to save power.
- 4) FSKEN should be set low to disable the FSK demodulator, when the FSK signal is not expected.
- 5) Tip/Ring DT-ASEN, PWDN and FSKEN are internal signals decoded from Control Bits CB2-0.
- 6) When CB0 is low, both  $\overline{\text{DR}}$  and DCLK pins are unused.

**MAXIMUM RATING** - Exceeding the following listed values may cause permanent damage.

Power Supply Voltage: -0.3 V to 6 V

Voltage on any pin other than supplies: GND - 0.3 V to VCC + 0.3 V

Current at any pin other than supplies:  $\leq 10$  mA

Storage Temperature: -65 °C to +150 °C

**RECOMMENDED OPERATING CONDITIONS**

Operating Temperature: -40 °C to +85 °C

Power Supply Voltage: 3 V  $\pm$  10% or 5 V  $\pm$  10%Clock Frequency: 3.579545 MHz  $\pm$  0.1%

Input Voltage: 0 V to VCC

**CRYSTAL SPECIFICATIONS**

Frequency: 3.579545 MHz

Resonance tolerance:  $\pm 0.1\%$  (-40°C to +85°C)

Resonance mode: Parallel

Load capacitance: 18 pF

Maximum series resistance: 150  $\Omega$ 

Maximum drive level: 2 mW

**DC ELECTRICAL CHARACTERISTICS**

Parameter	Pin	Description	Min	Typ	Max	Units	Test Conditions
I <sub>ccs</sub>	VCC	Power Supply Standby Current		0.5	15	$\mu$ A	Test 1
I <sub>cc</sub>		Operating Supply Current VCC = 5 V $\pm$ 10% VCC = 3 V $\pm$ 10%		2.5 1.8	3.8 2.7	mA mA	Test 2
V <sub>T+</sub>		Schmitt Trigger Input High Threshold	0.5VCC		0.7VCC	V	
V <sub>T-</sub>	DCLK	Schmitt Trigger Input Low Threshold	0.3VCC		0.5VCC	V	
V <sub>HYS</sub>		Schmitt Hysteresis	0.2			V	
V <sub>IH</sub>		CMOS Input High Voltage	0.7VCC		VCC	V	
V <sub>IL</sub>	CB0 CB1 CB2	CMOS Input Low Voltage	GND		0.3VCC	V	
I <sub>OH</sub>	DCLK, DATA, EST DR/STD, CD, ST/GT	Output High Sourcing Current	-0.8			mA	V <sub>OH</sub> =0.9VCC

Test 1: All inputs are VCC/GND except for oscillator pins. No analog input. Output unloaded. NW6006 in power down mode.

Test 2: All inputs are VCC/GND except for oscillator pins. No analog input. Output unloaded. FSK is enabled.

## DC ELECTRICAL CHARACTERISTICS (CONTINUED)

Parameter	Pin	Description	Min	Typ	Max	Units	Test Conditions
I <sub>OL</sub>	DCLK, DATA DR/STD, CD EST, ST/GT	Output Low Sinking Current	2			mA	V <sub>OL</sub> = 0.1VCC
I <sub>IN1</sub>	IN1+, IN1- IN2+, IN2-	Input Current			1	μA	V <sub>IN</sub> = VCC to GND
I <sub>IN2</sub>	DCLK CB0, CB1, CB2	Input Current			10	μA	
I <sub>OZ1</sub>	ST/GT	Output High Impedance			5	μA	V <sub>OUT</sub> = VCC to GND
VREF	VREF	Output Voltage	0.5VCC-0.1		0.5VCC+0.1	V	No Load
RREF		Output Resistance			2	kΩ	
V <sub>TGT</sub>	ST/GT	Comparator Threshold Voltage	0.5VCC-0.05		0.5VCC+0.05	V	

## AC ELECTRICAL CHARACTERISTICS

### DUAL TONE ALERT SIGNAL DETECTION

Parameter	Description	Min	Typ	Max	Units	Notes
F <sub>L</sub>	Low Tone Frequency		2130		Hz	Nominal frequency
F <sub>H</sub>	High Tone Frequency		2750		Hz	Nominal frequency
FDA	Frequency Deviation Accept	1.1%				Within this range, tones are accepted.
FDR	Frequency Deviation Reject	3.5%				Outside this range, tones are rejected.
SIGAC	Accept Signal Level per tone	-40		-2	dBV	Input op amp configured to 0 dB gain for 5 V operation, gain for 3 V operation is TBD. Signal level is per tone.
SIGRJ	Reject Signal Level per tone (VCC = 5 V ± 10%, 3 V ± 10%)			-47	dBV	
TA	Positive and Negative Twist Accept #			7	dB	
SNR	Signal to Noise Ratio ##	20			dB	

### STUTTER DIAL TONE SIGNAL DETECTION

Parameter	Description	Min	Typ	Max	Units	Notes
F <sub>L</sub>	Low Tone Frequency		350		Hz	Nominal frequency
F <sub>H</sub>	High Tone Frequency		440		Hz	Nominal frequency
FDA	Frequency Deviation Accept High Tone Low Tone	-7 -9		7 9	Hz	Within this range, tones are accepted.
FDR	Frequency Deviation Reject High Tone Low Tone	-13 -11		13 11		Outside this range, tones are rejected.
SIGAC	Accept Signal Level per tone	-31		-12	dBV	Input op amp configured to 0 dB gain for 5 V operation, gain for 3 V operation is TBD. Signal level is per tone.
SIGRJ	Reject Signal Level per tone (VCC = 5 V ± 10%, 3 V ± 10%)			-36	dBV	
TA	Positive and Negative Twist Accept #	-6		6	dB	
SNR	Signal to Noise Ratio ##	20			dB	

# Twist = 20 |log ( f<sub>H</sub> amplitude / f<sub>L</sub> amplitude )|.

## Both tones have the same amplitude and at nominal frequencies. Band limited random noise 300-3400 Hz. Measurement valid only when tone is present.

## AC ELECTRICAL CHARACTERISTICS (CONTINUED)

### GAIN ADJUSTABLE OP AMP

Parameter	Description	Min	Typ	Max	Units	Test Conditions
$I_{IN}$	Input Leakage Current			1	$\mu A$	$GND \leq V_{IN} \leq V_{CC}$
$R_{IN}$	Input Resistance	10			$M\Omega$	
$V_{OS}$	Input Offset Voltage			10	mV	
PSRR	Power Supply Rejection Ratio	40			dB	1kHz ripple on VCC
CMRR	Common Mode Rejection	30			dB	$V_{CMmin} \leq V_{IN} \leq V_{CMmax}$
$A_{VOL}$	DC Open Loop Voltage Gain	50			dB	
$f_c$	Unity Gain Bandwidth	0.3			MHz	
$V_O$	Output Voltage Swing	0.5		$V_{CC} - 0.5$	V	Load $\geq 100 k\Omega$
$C_L$	Maximum Capacitive Load (GS)			50	pF	
$R_L$	Maximum Resistive Load (GS)	100			$k\Omega$	
$V_{CM}$	Common Mode Range Voltage	1.0		$V_{CC} - 1.0$		

### FSK DETECTION

Parameter	Description	Min	Typ	Max	Units	Notes
ID	Input Detection Level	-40		-6.5	dBV	Production tested at $V_{CC} = 3V \pm 10\%$ , or $5V \pm 10\%$ . Both mark and space have the same amplitude.
RS	Reject Signal Level			-48	dBV	
TR	Transmission Rate	1188	1200	1212	baud	
FMARK	Input Frequency Detection Bell 202 '1' (mark)	1188	1200	1212	Hz	
FSPACE	Input Frequency Detection Bell 202 '0' (space)	2178	2200	2222	Hz	
FMARK	Input Frequency Detection ITU-T V.23 '1' (mark)	1280.5	1300	1319.5	Hz	
FSPACE	Input Frequency Detection ITU-T V.23 0 (space)	2068.5	2100	2131.5	Hz	
TA	Positive and Negative Twist Accept	-10		10	dB	
SNR	Signal to Noise Ratio	20			dB	Both mark and space have the same amplitude and at nominal frequencies. Band limited random noise: 200-3400 Hz. Present only when FSK signal is present. #

# BT band is 200-3400 Hz, while Bellcore band is 0-4 kHz.

#### Notes:

dBV = decibels above or below a reference voltage of 1 Vrms.

AC TIMING CHARACTERISTICS

POWER UP/DOWN AND FSK DETECTION

Parameter	Description	Min	Typ	Max	Units	Test Conditions
t1	Power Up Time			50	ms	
t2	Power Down Time			1	ms	
t3	Input FSK to $\overline{CD}$ low delay			25	ms	
t4	Input FSK to $\overline{CD}$ high delay	10			ms	
t5	Hysteresis	10			ms	

DUAL TONE ALERT SIGNAL

Parameter	Description	Min	Typ	Max	Units	Test Conditions
t6	Alert Signal Present Detect Time	4		14	ms	
t7	Alert Signal Absent Detect Time	0.1		8	ms	

Figure 14. Power Up/Down Timing

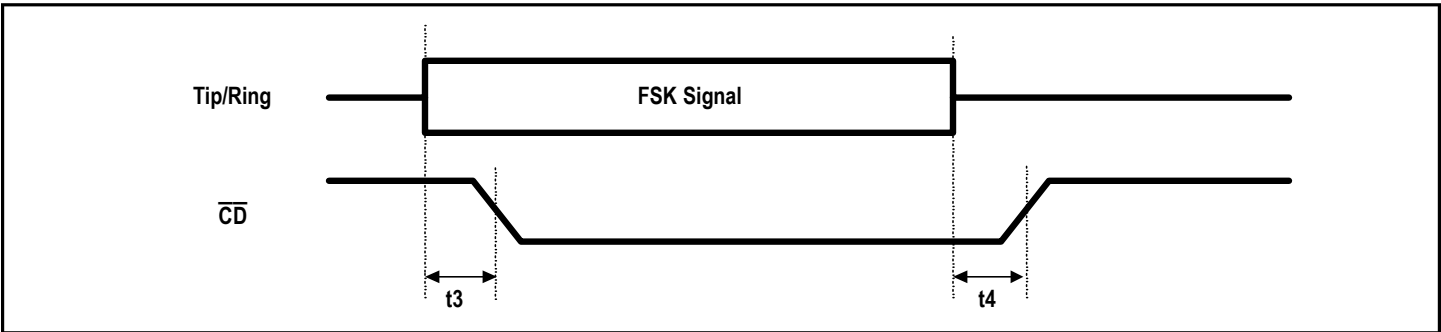

Figure 15. FSK Detection Time

## AC TIMING CHARACTERISTICS (CONTINUED)

### SERIAL INTERFACE (MODE '1')

Parameter	Description	Min	Typ	Max	Units	Test Conditions
t11	DCLK Cycle Time	1			$\mu$ s	
t12	DCLK High Time	0.3			$\mu$ s	
t13	DCLK Low Time	0.3			$\mu$ s	
t14	DCLK Rise Time			100	ns	
t15	DCLK Fall Time			100	ns	
t16	DCLK Low Setup to $\overline{DR}$	500			ns	
t17	DCLK Low Hold Time after $\overline{DR}$	500			ns	

Figure 17. DCLK Timing in Mode '1'

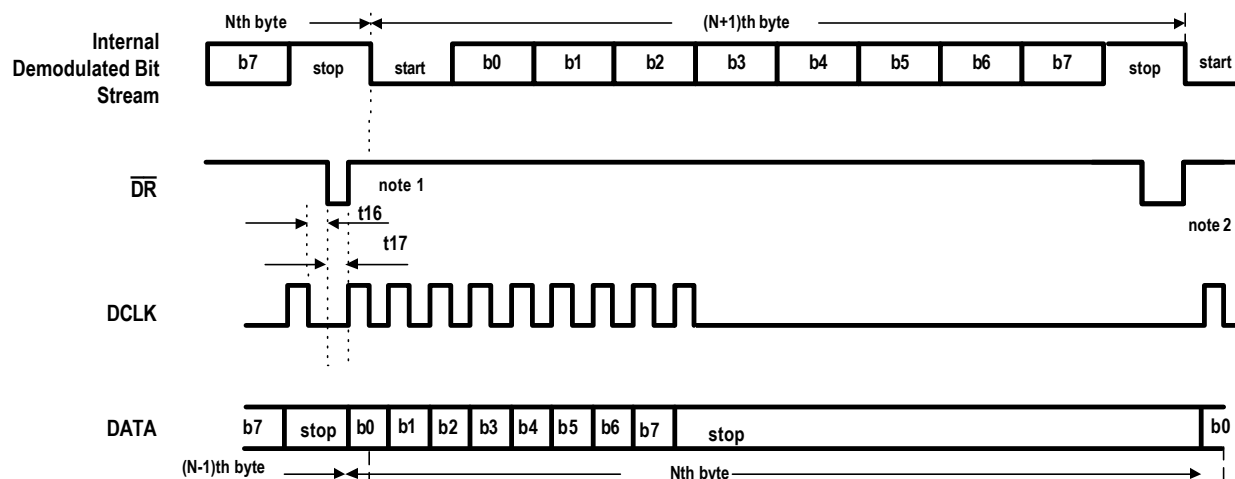

Figure 18. Serial Data Interface Timing in MODE '1'

**Notes:**

1. DCLK clears  $\overline{DR}$ .
2.  $\overline{DR}$  not cleared by DCLK, low for a maximum time of 1/2 bit width.

AC TIMING CHARACTERISTICS (CONTINUED)

SERIAL INTERFACE (MODE '0')

Parameter	Description	Min	Typ	Max	Units	Test Conditions
DR	Data Rate	1188	1200	1212	baud	1
t21	Input FSK to DATA Delay		1	5	ms	
t22	DATA Rise Time			200	ns	2
t23	DATA Fall Time			200	ns	2

Test conditions:  
1. FSK input data at 1200 ± 12 buad.  
2. Load of 50 pF.

Figure 19. DATA Output Timing in Mode '0'

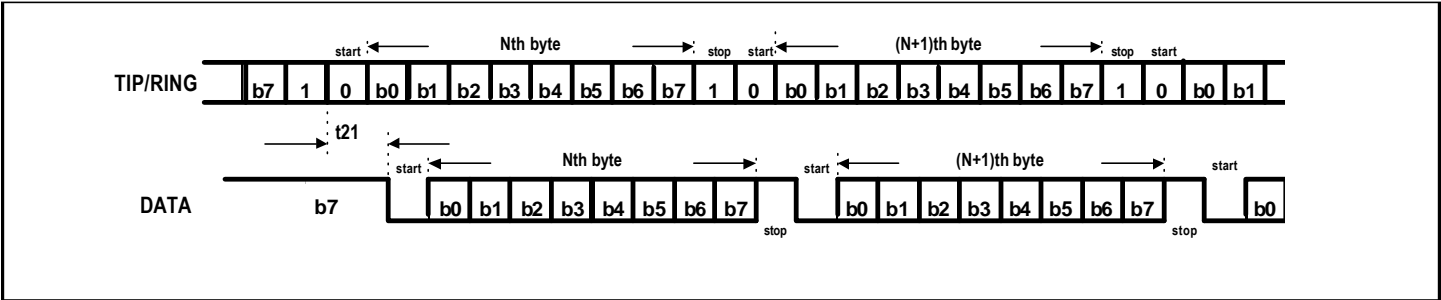

Figure 20. Serial Data Interface Timing in MODE '0'

## STUTTER DIAL TONE SIGNAL

Parameter	Description	Min	Typ	Max	Units	Test Conditions
t18	Stutter Dial Tone Signal Present Detect Time	40	50	68	ms	
t19	Stutter Dial Tone Signal Absent Detect Time	32	48	52	ms	
t20	Stutter Dial Tone Signal Duration Time	64	100	108	ms	SDT signal 100 ms on, 100 ms off.
