ZL50417

Unmanaged 16-Port 10/100M + 2-Port 1G Ethernet Switch

Data Sheet

February 2003

Features

- Integrated Single-Chip 10/100/1000 Mbps Ethernet Switch
- 16 10/100 Mbps Autosensing, Fast Ethernet Ports with RMII or Serial Interface (7WS). Each port can independently use one of the two interfaces.
- 2 Gigabit Ports with GMII, PCS, 10/100 options per port
- Serial CPU interface for configuration
- Supports two Frame Buffer Memory domains with SRAM at 100 MHz
- Supports memory size 2 MB, or 4 MB
- Applies centralized shared memory architecture
- Up to 64K MAC addresses
- Maximum throughput is 3.6 Gbps non-blocking
- High performance packet forwarding (10.712M packets per second) at full wire speed
- Full Duplex Ethernet IEEE 802.3x Flow Control
- Backpressure flow control for Half Duplex ports
- Supports Ethernet multicasting and broadcasting and flooding control
- Supports per-system option to enable flow control for best effort frames even on QoS-enabled ports
- Traffic Classification

Ordering Information

ZL50417/GKC 553 PIN HSBGA

-40°C to +85°C

  - 4 transmission priorities for Fast Ethernet ports with 2 dropping levels
  - Classification based on:
    - Port based priority
    - VLAN Priority field in VLAN tagged frame
    - DS/TOS field in IP packet
    - UDP/TCP logical ports: 8 hard-wired and 8 programmable ports, including one programmable range
  - The precedence of the above classifications is programmable.
- QoS Support
  - Supports IEEE 802.1p/Q Quality of Service with 4 transmission priority queues with delay bounded, strict priority, and WFQ service disciplines
  - Provides 2 levels of dropping precedence with WRED mechanism

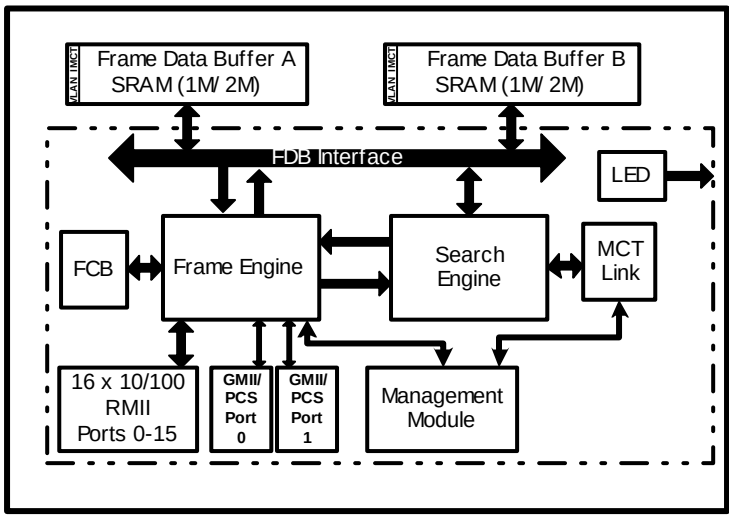

Figure 1 - System Block Diagram

  - User controls the WRED thresholds.
  - Buffer management: per class and per port buffer reservations
  - Port-based priority: VLAN priority in a tagged frame can be overwritten by the priority of Port VLAN ID.
- 3 port trunking groups, one for the 2 Gigabit ports, and two groups for 10/100 ports, with up to 4 10/100 ports per group. Or 8 groups for 10/100 ports with up to 2 10/100 ports per group
- Load sharing among trunked ports can be based on source MAC and/or destination MAC. The Gigabit trunking group has one more option, based on source port.
- Port Mirroring to a dedicated mirroring port
- Full set of LED signals provided by a serial interface, or 6 LED signals dedicated to Gigabit port status only (without serial interface)
- Hardware auto-negotiation through serial management interface (MDIO) for Ethernet ports
- Built-in reset logic triggered by system malfunction
- Built-In Self Test for internal and external SRAM
- I²C EEPROM for configuration
- 553 BGA package

Description

The ZL50417 is a high density, low cost, high performance, non-blocking Ethernet switch chip. A single chip provides 16 ports at 10/100 Mbps, 2 ports at 1000 Mbps. The Gigabit ports can also support 10/100M.

The chip supports up to 64K MAC addresses. The centralized shared memory architecture permits a very high performance packet forwarding rate at up to 5.357M packets per second at full wire speed. The chip is optimized to provide low-cost, high-performance workgroup switching.

Two Frame Buffer Memory domains utilize cost-effective, high-performance synchronous SRAM with aggregate bandwidth of 12.8 Gbps to support full wire speed on all ports simultaneously.

With delay bounded, strict priority, and/or WFQ transmission scheduling, and WRED dropping schemes, the ZL50417 provides powerful QoS functions for various multimedia and mission-critical applications. The chip provides 4 transmission priorities (8 priorities per Gigabit port) and 2 levels of dropping precedence. Each packet is assigned a transmission priority and dropping precedence based on the VLAN priority field in a VLAN tagged frame, or the DS/TOS field, and UDP/TCP logical port fields in IP packets. The ZL50417 recognizes a total of 16 UDP/TCP logical ports, 8 hard-wired and 8 programmable (including one programmable range).

The ZL50417 supports 3 groups of port trunking/load sharing. One group is dedicated to the two Gigabit ports, and the other two groups to 10/100 ports, where each 10/100 group can contain up to 4 ports. Port trunking/load sharing can be used to group ports between interlinked switches to increase the effective network bandwidth.

In half-duplex mode, all ports support backpressure flow control, to minimize the risk of losing data during long activity bursts. In full-duplex mode, IEEE 802.3x flow control is provided. The ZL50417 also supports a per-system option to enable flow control for best effort frames, even on QoS-enabled ports.

The Physical Coding Sublayer (PCS) is integrated on-chip to provide a direct 10-bit interface for connection to SERDES chips. The PCS can be bypassed to provide a GMII interface.

The ZL50417 is fabricated using 0.25 micron technology. Inputs, however, are 3.3 V tolerant, and the outputs are capable of directly interfacing to LVTTL levels. The ZL50417 is packaged in a 553-pin Ball Grid Array package.

1.0 Block Functionality

1.1 Frame Data Buffer (FDB) Interfaces

The FDB interface supports pipelined synchronous burst SRAM (SBRAM) memory at 100 MHz. To ensure a non-blocking switch, two memory domains are required. Each domain has a 64 bit wide memory bus. At 100 MHz, the aggregate memory bandwidth is 12.8 Gbps, which is enough to support 16 10/100 Mbps and 2 Gigabit ports at full wire speed switching.

The Switching Database is also located in the external SRAM; it is used for storing MAC addresses and their physical port number. It is duplicated and stored in both memory domains. Therefore, when the system updates the contents of the switching database, it has to write the entry to both domains at the same time.

1.2 GMII/PCS MAC Module (GMAC)

The GMII/PCS Media Access Control (MAC) module provides the necessary buffers and control interface between the Frame Engine (FE) and the external physical device (PHY).

The ZL50417 GMAC implements both GMII and MII interface, which offers a simple migration from 10/100 to 1G. The GMAC of the ZL50417 meets the IEEE 802.3Z specification. It is able to operate in 10M/100M either Half or Full Duplex mode with a back pressure/flow control mechanism or in 1G Full duplex mode with flow control mechanism. Furthermore, it will automatically retransmit upon collision for up to 16 total transmissions. PHY addresses for GMAC are 01h and 02h.

For fiber optics media, the ZL50417 implements the Physical Code Sublayer (PCS) interface. The PCS includes an 8B10B encoder and decoder, auto-negotiation, and Ten Bit Interface (TBI).

1.3 Physical Coding Sublayer (PCS) Interface

For the ZL50417, the 1000BASE-X PCS Interface is designed internally and may be utilized in the absence of a GMII. The PCS incorporates all the functions required by the GMII to include encoding (decoding) 8B GMII data to (from) 8B/10B TBI format for PHY communication and generating Collision Detect (COL) signals for half-duplex mode. It also manages the Auto negotiation process by informing the management entity that the PHY is ready for communications. The on-chip TBI may be disabled if TBI exists within the Gigabit PHY. The TBI interface provides a uniform interface for all 1000 Mbps PHY implementations.

The PCS comprises the PCS Transmit, Synchronization, PCS Receive, and Auto negotiation processes for 1000BASE-X.

The PCS Transmit process sends the TBI signals TXD [9:0] to the physical medium and generates the GMII Collision Detect (COL) signal based on whether a reception is occurring simultaneously with transmission. Additionally, the Transmit process generates an internal “transmitting” flag and monitors Auto negotiation to determine whether to transmit data or to reconfigure the link.

The PCS Synchronization process determines whether or not the receive channel is operational.

The PCS Receive process generates RXD [7:0] on the GMII from the TBI data [9:0], and the internal “receiving” flag for use by the Transmit processes.

The PCS Auto negotiation process allows the ZL50417 to exchange configuration information between two devices that share a link segment, and to automatically configure the link for the appropriate speed of operation for both devices.

1.4 10/100 MAC Module (RMAC)

The 10/100 Media Access Control module provides the necessary buffers and control interface between the Frame Engine (FE) and the external physical device (PHY). The ZL50417 has two interfaces, RMII or Serial (only for 10M). The 10/100 MAC of the ZL50417 device meets the IEEE 802.3 specification. It is able to operate in either Half or Full Duplex mode with a back pressure/flow control mechanism. In addition, it will automatically retransmit upon collision for up to 16 total transmissions. The PHY addresses for 16 10/100 MAC are from 08h to 1Fh.

1.5 Configuration Interface Module

The ZL50417 supports a serial and an I2C interface, which provides an easy way to configure the system. Once configured, the resulting configuration can be stored in an I2C EEPROM.

1.6 Frame Engine

The main function of the frame engine is to forward a frame to its proper destination port or ports. When a frame arrives, the frame engine parses the frame header (64 bytes) and formulates a switching request, which is sent to the search engine to resolve the destination port. The arriving frame is moved to the FDB. After receiving a switch response from the search engine, the frame engine performs transmission scheduling based on the frame's priority. The frame engine forwards the frame to the MAC module when the frame is ready to be sent.

1.7 Search Engine

The Search Engine resolves the frame's destination port or ports according to the destination MAC address (L2) or IP multicast address (IP multicast packet) by searching the database. It also performs MAC learning, priority assignment, and trunking functions.

1.8 LED Interface

The LED interface provides a serial interface for carrying 16+2 port status signals. It can also provide direct status pins (6) for the two Gigabit ports.

1.9 Internal Memory

Several internal tables are required and are described as follows:

- Frame Control Block (FCB) - Each FCB entry contains the control information of the associated frame stored in the FDB, e.g. frame size, read/write pointer, transmission priority, etc.
- MCT Link Table - The MCT Link Table stores the linked list of MCT entries that have collisions in the external MAC Table. The external MAC table is located in the FDB Memory.

Note that the external MAC table is located in the external SSRAM Memory.

2.0 System Configuration

2.1 Configuration Mode

The ZL50417 can be configured by EEPROM (24C02 or compatible) via an I²C interface at boot time, or via a synchronous serial interface during operation.

2.2 I²C Interface

The I²C interface uses two bus lines, a serial data line (SDA) and a serial clock line (SCL). The SCL line carries the control signals that facilitate the transfer of information from EEPROM to the switch. Data transfer is 8-bit serial and bidirectional, at 50 Kbps. Data transfer is performed between master and slave IC using a request / acknowledgment style of protocol. The master IC generates the timing signals and terminates data transfer. Figure 2 depicts the data transfer format.

START	SLAVE ADDRESS	R/W	ACK	DATA 1 (8 bits)	ACK	DATA2	ACK	DATAM	ACK	STOP

Figure 2 - Data Transfer Format for I2C Interface

2.2.1 Start Condition

Generated by the master (in our case, the ZL50417). The bus is considered to be busy after the Start condition is generated. The Start condition occurs if while the SCL line is High, there is a High-to-Low transition of the SDA line.

Other than in the Start condition (and Stop condition), the data on the SDA line must be stable during the High period of SCL. The High or Low state of SDA can only change when SCL is Low. In addition, when the I²C bus is free, both lines are High.

2.2.2 Address

The first byte after the Start condition determines which slave the master will select. The slave in our case is the EEPROM. The first seven bits of the first data byte make up the slave address.

2.2.3 Data Direction

The eighth bit in the first byte after the Start condition determines the direction (R/W) of the message. A master transmitter sets this bit to W; a master receiver sets this bit to R.

2.2.4 Acknowledgment

Like all clock pulses, the acknowledgment-related clock pulse is generated by the master. However, the transmitter releases the SDA line (High) during the acknowledgment clock pulse. Furthermore, the receiver must pull down the SDA line during the acknowledge pulse so that it remains stable Low during the High period of this clock pulse. An acknowledgment pulse follows every byte transfer.

If a slave receiver does not acknowledge after any byte, then the master generates a Stop condition and aborts the transfer.

If a master receiver does not acknowledge after any byte, then the slave transmitter must release the SDA line to let the master generate the Stop condition.

2.2.5 Data

After the first byte containing the address, all bytes that follow are data bytes. Each byte must be followed by an acknowledge bit. Data is transferred MSB first.

2.2.6 Stop Condition

Generated by the master. The bus is considered to be free after the Stop condition is generated. The Stop condition occurs if while the SCL line is High, there is a Low-to-High transition of the SDA line.

The I²C interface serves the function of configuring the ZL50417 at boot time. The master is the ZL50417, and the slave is the EEPROM memory.

2.3 Synchronous Serial Interface

The synchronous serial interface serves the function of configuring the ZL50417 not at boot time but via a PC. The PC serves as master and the ZL50417 serves as slave. The protocol for the synchronous serial interface is nearly identical to the I²C protocol. The main difference is that there is no acknowledgment bit after each byte of data transferred.

The unmanaged ZL50417 uses a synchronous serial interface to program the internal registers. To reduce the number of signals required, the register address, command and data are shifted in serially through the D0 pin. STROBE- pin is used as the shift clock. AUTOFD- pin is used as data return path.

Each command consists of four parts.

- START pulse
- Register Address
- Read or Write command
- Data to be written or read back

Any command can be aborted in the middle by sending a ABORT pulse to the ZL50417.

A START command is detected when D0 is sampled high when STROBE- rise and D0 is sampled low when STROBE- fall.

An ABORT command is detected when D0 is sampled low when STROBE- rise and D0 is sampled high when STROBE- fall.

2.3.1 Write Command

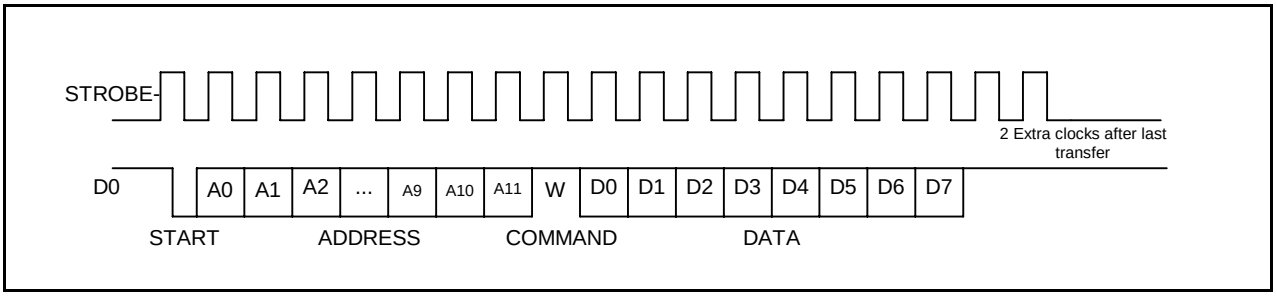

Figure 3 - Write Command

2.3.2 Read Command

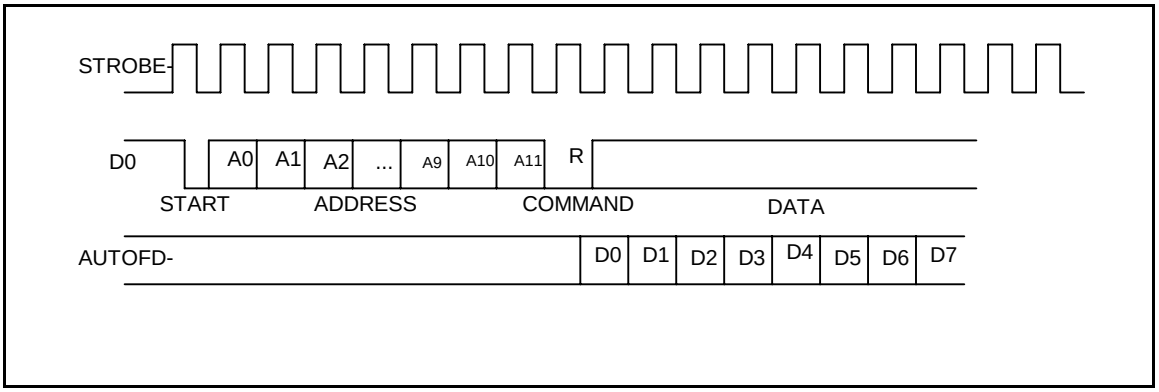

Figure 4 - Read Command

All registers in ZL50417 can be modified through this synchronous serial interface.

3.0 ZL50417 Data Forwarding Protocol

3.1 Unicast Data Frame Forwarding

When a frame arrives, it is assigned a handle in memory by the Frame Control Buffer Manager (FCB Manager). An FCB handle will always be available, because of advance buffer reservations.

The memory (SRAM) interface is two 64-bit buses, connected to two SRAM banks, A and B. The Receive DMA (RxDMA) is responsible for multiplexing the data and the address. On a port's "turn," the RxDMA will move 8 bytes (or up to the end-of-frame) from the port's associated RxFIFO into memory (Frame Data Buffer, or FDB).

Once an entire frame has been moved to the FDB, and a good end-of-frame (EOF) has been received, the Rx interface makes a switch request. The RxDMA arbitrates among multiple switch requests.

The switch request consists of the first 64 bytes of a frame, containing among other things, the source and destination MAC addresses of the frame. The search engine places a switch response in the switch response queue of the frame engine when done. Among other information, the search engine will have resolved the destination port of the frame and will have determined that the frame is unicast.

After processing the switch response, the Transmission Queue Manager (TxQ manager) of the frame engine is responsible for notifying the destination port that it has a frame to forward to it. But first, the TxQ manager has to decide whether or not to drop the frame, based on global FDB reservations and usage, as well as TxQ occupancy at the destination. If the frame is not dropped, then the TxQ manager links the frame's FCB to the correct per-port-per-class TxQ. Unicast TxQ's are linked lists of transmission jobs, represented by their associated frames' FCB's. There is one linked list for each transmission class for each port. There are 4 transmission classes for each of the 16 10/ 100 ports, and 8 classes for each of the two Gigabit ports – a total of 112 unicast queues.

The TxQ manager is responsible for scheduling transmission among the queues representing different classes for a port. When the port control module determines that there is room in the MAC Transmission FIFO (TxFIFO) for another frame, it requests the handle of a new frame from the TxQ manager. The TxQ manager chooses among the head-of-line (HOL) frames from the per-class queues for that port, using a Zarlink Semiconductor scheduling algorithm.

The Transmission DMA (TxDMA) is responsible for multiplexing the data and the address. On a port's turn, the TxDMA will move 8 bytes (or up to the EOF) from memory into the port's associated TxFIFO. After reading the EOF, the port control requests a FCB release for that frame. The TxDMA arbitrates among multiple buffer release requests.

The frame is transmitted from the TxFIFO to the line.

3.2 Multicast Data Frame Forwarding

After receiving the switch response, the TxQ manager has to make the dropping decision. A global decision to drop can be made, based on global FDB utilization and reservations. If so, then the FCB is released and the frame is dropped. In addition, a selective decision to drop can be made, based on the TxQ occupancy at some subset of the multicast packet's destinations. If so, then the frame is dropped at some destinations but not others, and the FCB is not released.

If the frame is not dropped at a particular destination port, then the TxQ manager formats an entry in the multicast queue for that port and class. Multicast queues are physical queues (unlike the linked lists for unicast frames). There are 2 multicast queues for each of the 16 10/100 ports. The queue with higher priority has room for 32 entries and the queue with lower priority has room for 64 entries. There are 4 multicast queues for each of the two Gigabit ports. The size of the queues are: 32 entries (higher priority queue), 32 entries, 32 entries and 64 entries (lower priority queue). There is one multicast queue for every two priority classes. For the 10/100 ports to map the 8

transmit priorities into 2 multicast queues, the 2 LSB are discarded. For the gigabit ports to map the 8 transmit priorities into 4 multicast queues, the LSB are discarded.

During scheduling, the TxQ manager treats the unicast queue and the multicast queue of the same class as one logical queue. The older head of line of the two queues is forwarded first.

The port control requests a FCB release only after the EOF for the multicast frame has been read by all ports to which the frame is destined.

4.0 Memory Interface

4.1 Overview

The ZL50417 provides two 64-bit-wide SRAM banks, SRAM Bank A and SRAM Bank B, with a 64-bit bus connected to each. Each DMA can read and write from both bank A and bank B. The following figure provides an overview of the ZL50417 SRAM banks.

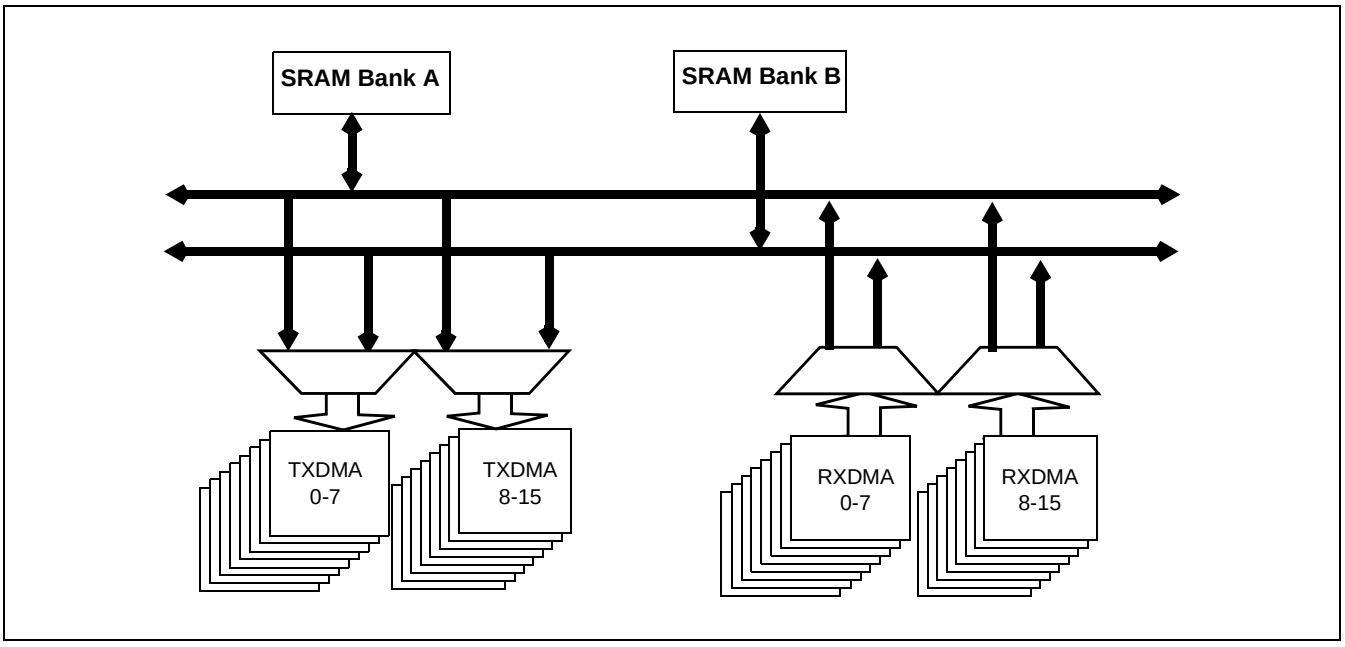

Figure 5 - ZL50417 SRAM Interface Block Diagram (DMAs for 10/1000 Ports Only)

4.2 Detailed Memory Information

Because the bus for each bank is 64 bits wide, frames are broken into 8-byte granules, written to and read from memory. The first 8-byte granule gets written to Bank A, the second 8-byte granule gets written to Bank B, and so on in alternating fashion. When reading frames from memory, the same procedure is followed, first from A, then from B, and so on.

The reading and writing from alternating memory banks can be performed with minimal waste of memory bandwidth. What's the worst case? For any speed port, in the worst case, a 1-byte-long EOF granule gets written to Bank A. This means that a 7-byte segment of Bank A bandwidth is idle, and furthermore, the next 8-byte segment of Bank B bandwidth is idle, because the first 8 bytes of the next frame will be written to Bank A, not B. This scenario results in a maximum 15 bytes of waste per frame, which is always acceptable because the interframe gap is 20 bytes.

4.3 Memory Requirements

To speed up searching and decrease memory latency, the external MAC address database is duplicated in both memory banks. To support 64K MAC address, 4 MB memory is required. When VLAN support is enabled, 512 entries of the MAC address table are used for storing the VLAN ID at VLAN Index Mapping Table.

Up to 2K Ethernet frame buffers are supported and they will use 3 MB of memory. Each frame uses 1536 bytes. The maximum system memory requirement is 4 MB. If less memory is desired, the configuration can scale down.

Memory Configuration

Bank A	Bank B	Tag based VLAN	Frame Buffer	Max MAC Address
1M	1M	Disable	1K	32K
1M	1M	Enable	1K	31.5K
2M	2M	Disable	2K	64K
2M	2M	Enable	2K	63.5K

Memory Map

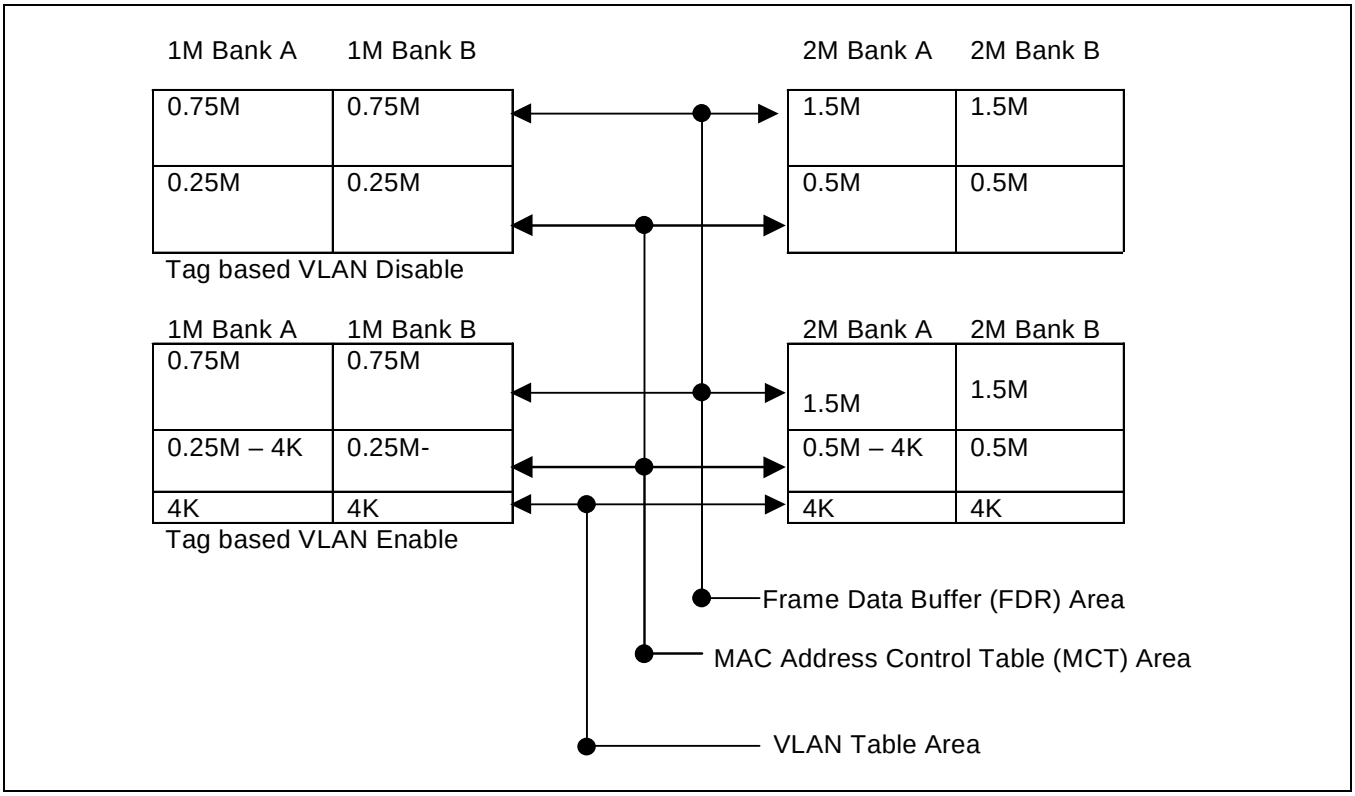

Figure 6 - Memory Map

5.0 Search Engine

5.1 Search Engine Overview

The ZL50417 search engine is optimized for high throughput searching, with enhanced features to support:

- Up to 64K MAC addresses
- Up to 255 VLAN and IP Multicast groups
- 3 groups of port trunking (1 for the two Gigabit ports, and 2 others)
- Traffic classification into 4 (or 8 for Gigabit) transmission priorities, and 2 drop precedence levels
- Packet filtering
- Security
- IP Multicast
- Flooding, Broadcast, Multicast Storm Control
- MAC address learning and aging

5.2 Basic Flow

Shortly after a frame enters the ZL50417 and is written to the Frame Data Buffer (FDB), the frame engine generates a Switch Request, which is sent to the search engine. The switch request consists of the first 64 bytes of the frame, which contain all the necessary information for the search engine to perform its task. When the search engine is done, it writes to the Switch Response Queue, and the frame engine uses the information provided in that queue for scheduling and forwarding.

In performing its task, the search engine extracts and compresses the useful information from the 64-byte switch request. Among the information extracted are the source and destination MAC addresses, the transmission and discard priorities, whether the frame is unicast or multicast, and VLAN ID. Requests are sent to the external SRAM to locate the associated entries in the external hash table.

When all the information has been collected from external SRAM, the search engine has to compare the MAC address on the current entry with the MAC address for which it is searching. If it is not a match, the process is repeated on the internal MCT Table. All MCT entries other than the first of each linked list are maintained internal to the chip. If the desired MAC address is still not found, then the result is either learning (source MAC address unknown) or flooding (destination MAC address unknown).

In addition, port based VLAN information is used to select the correct set of destination ports for the frame (for multicast), or to verify that the frame's destination port is associated with the VLAN (for unicast).

If the destination MAC address belongs to a port trunk, then the trunk number is retrieved instead of the port number. But on which port of the trunk will the frame be transmitted? This is easily computed using a hash of the source and destination MAC addresses.

When all the information is compiled, the switch response is generated, as stated earlier.

5.3 Search, Learning, and Aging

5.3.1 MAC Search

The search block performs source MAC address and destination MAC address searching. As we indicated earlier, if a match is not found, then the next entry in the linked list must be examined, and so on until a match is found or the end of the list is reached.

In port based VLAN mode, a bitmap is used to determine whether the frame should be forwarded to the outgoing port. When the egress port is not included in the ingress port VLAN bitmap, the packet is discarded.

The MAC search block is also responsible for updating the source MAC address timestamp and the VLAN port association timestamp, used for aging.

5.3.2 Learning

The learning module learns new MAC addresses and performs port change operations on the MCT database. The goal of learning is to update this database as the networking environment changes over time.

5.3.3 Aging

Aging time is controlled by register 400h and 401h.

The aging module scans and ages MCT entries based on a programmable “age out” time interval. As we indicated earlier, the search module updates the source MAC address timestamps for each frame it processes. When an entry is ready to be aged, the entry is removed from the table.

5.4 Quality of Service

Quality of Service (QoS) refers to the ability of a network to provide better service to selected network traffic over various technologies. Primary goals of QoS include dedicated bandwidth, controlled jitter and latency (required by some real-time and interactive traffic), and improved loss characteristics.

Traditional Ethernet networks have had no prioritization of traffic. Without a protocol to prioritize or differentiate traffic, a service level known as “best effort” attempts to get all the packets to their intended destinations with minimum delay; however, there are no guarantees. In a congested network or when a low-performance switch/router is overloaded, “best effort” becomes unsuitable for delay-sensitive traffic and mission-critical data transmission.

The advent of QoS for packet-based systems accommodates the integration of delay-sensitive video and multimedia traffic onto any existing Ethernet network. It also alleviates the congestion issues that have previously plagued such “best effort” networking systems. QoS provides Ethernet networks with the breakthrough technology to prioritize traffic and ensure that a certain transmission will have a guaranteed minimum amount of bandwidth.

Extensive core QoS mechanisms are built into the ZL50417 architecture to ensure policy enforcement and buffering of the ingress port, as well as weighted fair-queue(WFQ) scheduling at the egress port.

In the ZL50417, QoS-based policies sort traffic into a small number of classes and mark the packets accordingly. The QoS identifier provides specific treatment to traffic in different classes, so that different quality of service is provided to each class. Frame and packet scheduling and discarding policies are determined by the class to which the frames and packets belong. For example, the overall service given to frames and packets in the premium class will be better than that given to the standard class; the premium class is expected to experience lower loss rate or delay.

The ZL50417 supports the following QoS techniques:

In a port-based setup, any station connected to the same physical port of the switch will have the same transmit priority.

In a tag-based setup, a 3-bit field in the VLAN tag provides the priority of the packet. This priority can be mapped to different queues in the switch to provide QoS.

In a TOS/DS-based set up, TOS stands for “Type of Service” that may include “minimize delay,” “maximize throughput,” or “maximize reliability.” Network nodes may select routing paths or forwarding behaviors that are suitably engineered to satisfy the service request.

In a logical port-based set up, a logical port provides the application information of the packet. Certain applications are more sensitive to delays than others; using logical ports to classify packets can help speed up delay sensitive applications, such as VoIP.

5.5 Priority Classification Rule

Figure 7 shows the ZL50417 priority classification rule.

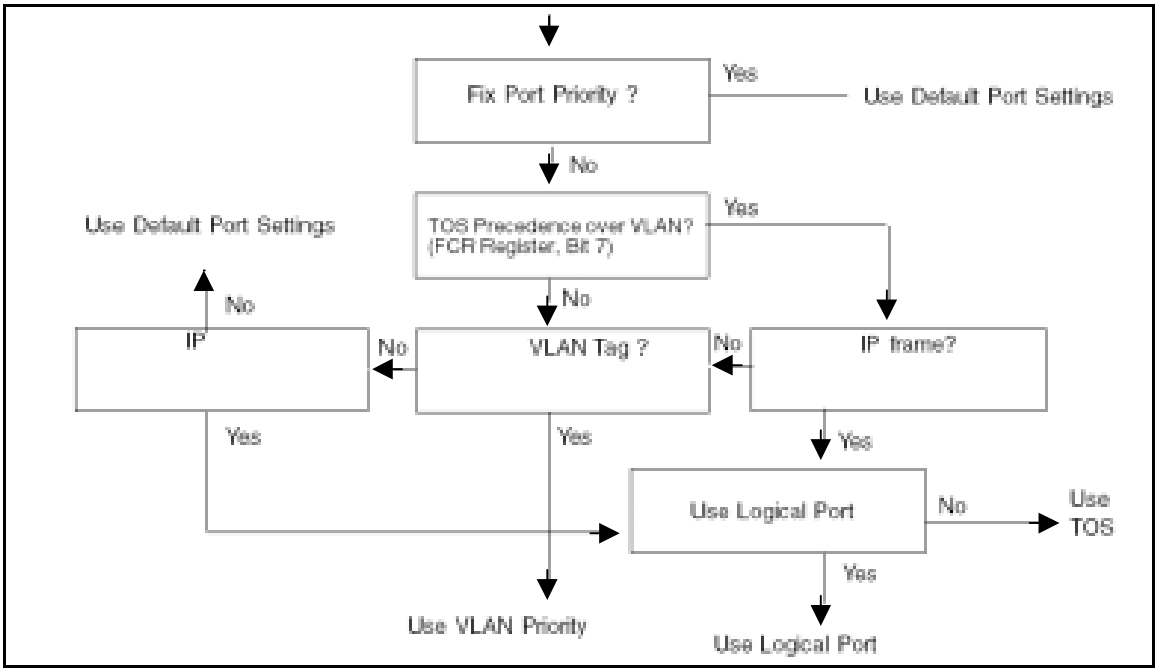

Figure 7 - Priority Classification Rule

5.6 Port-Based VLAN

An administrator can use the PVMAP Registers to configure the ZL50417 for port-based VLAN (see “Registration Definition” on page 42). For example, ports 1-3 might be assigned to the Marketing VLAN, ports 4-6 to the Engineering VLAN, and ports 7-9 to the Administrative VLAN. The ZL50417 determines the VLAN membership of each packet by noting the port on which it arrives. From there, the ZL50417 determines which outgoing port(s) is/are eligible to transmit each packet, or whether the packet should be discarded. Gigabit port 0 and 1 are denoted as Port 25 and 26 respectively.

	Destination Port Numbers Bit Map				
Port Registers	18	…	2	1	0
Register for Port #0 PVMAP00_0[7:0] to PVMAP00_3[2:0]	0		1	1	0
Register for Port #1 PVMAP01_0[7:0] to PVMAP01_3[2:0]	0		1	0	1
Register for Port #2 PVMAP02_0[7:0] to PVMAP02_3[2:0]	0		0	0	0
…					
Register for Port #18 PVMAP26_0[7:0] to PVMAP26_3[2:0]	0		0	0	0

For example, in the above table a 1 denotes that an outgoing port is eligible to receive a packet from an incoming port. A 0 (zero) denotes that an outgoing port is not eligible to receive a packet from an incoming port.

In this example:

Data packets received at port #0 are eligible to be sent to outgoing ports 1 and 2.

Data packets received at port #1 are eligible to be sent to outgoing ports 0 and 2.

Data packets received at port #2 are **NOT** eligible to be sent to ports 0 and 1.

5.7 Memory Configurations

The ZL50417 supports the following memory configurations. Pipeline SBRAM modes support 1 M and 2M per bank configurations. For detail connection information, please reference the memory application note.

Configuration	1 M per bank (Bootstrap pin TSTOUT7 = open)	2 M per bank (Bootstrap pin TSTOUT7 = pull down)	Connections
Single Layer (Bootstrap pin TSTOUT13 = open)	Two 128 K x 32 SRAM/bank or One 128 K x 64 SRAM/bank	Two 256K x 32 SRAM/bank	Connect 0E# and WE#
Double Layer (Bootstrap pin TSTOUT13 = pull down)	NA	Four 128 K x 32 SRAM/bank or Two 128 K x 64 SRAM/bank	Connect 0E0# and WE0# Connect 0E1# and WE1#

Table 1 - Supported Memory Configurations (Pipeline SBRAM Mode)

	Only Bank A		Bank A and Bank B	
	1M (SRAM)	2M (SRAM)	1M/bank (SRAM)	2M/bank (SRAM)
ZL50415	X	X		
ZL50416	X	X		
ZL50417			X	X
ZL50418			X	X

6.0 Frame Engine

6.1 Data Forwarding Summary

When a frame enters the device at the RxMAC, the RxDMA will move the data from the MAC RxFIFO to the FDB. Data is moved in 8-byte granules in conjunction with the scheme for the SRAM interface.

A switch request is sent to the Search Engine. The Search Engine processes the switch request.

A switch response is sent back to the Frame Engine and indicates whether the frame is unicast or multicast, and its destination port or ports. A VLAN table lookup is performed as well.

A Transmission Scheduling Request is sent in the form of a signal notifying the TxQ manager. Upon receiving a Transmission Scheduling Request, the device will format an entry in the appropriate Transmission Scheduling Queue (TxSch Q) or Queues. There are 4 TxSch Q for each 10/100 port (and 8 per Gigabit port), one for each priority. Creation of a queue entry either involves linking a new job to the appropriate linked list if unicast, or adding an entry to a physical queue if multicast.

When the port is ready to accept the next frame, the TxQ manager will get the head-of-line (HOL) entry of one of the TxSch Qs, according to the transmission scheduling algorithm (so as to ensure per-class quality of service). The unicast linked list and the multicast queue for the same port-class pair are treated as one logical queue. The older HOL between the two queues goes first. For 10/100 ports multicast queue 0 is associated with unicast queue 0 and multicast queue 1 is associated with unicast queue 2. For Gigabit ports multicast queue 0 is associated with unicast queue 0, multicast queue 1 with unicast queue 2, multicast queue 2 with unicast queue 4 and multicast queue 3 with unicast queue 6.

The TxDMA will pull frame data from the memory and forward it granule-by-granule to the MAC TxFIFO of the destination port.

6.2 Frame Engine Details

This section briefly describes the functions of each of the modules of the ZL50417 frame engine.

6.2.1 FCB Manager

The FCB manager allocates FCB handles to incoming frames, and releases FCB handles upon frame departure. The FCB manager is also responsible for enforcing buffer reservations and limits. The default values can be determined by referring to Chapter 7. In addition, the FCB manager is responsible for buffer aging, and for linking unicast forwarding jobs to their correct TxSch Q. The buffer aging can be enabled or disabled by the bootstrap pin and the aging time is defined in register FCBAT.

6.2.2 Rx Interface

The Rx interface is mainly responsible for communicating with the RxMAC. It keeps track of the start and end of frame and frame status (good or bad). Upon receiving an end of frame that is good, the Rx interface makes a switch request.

6.2.3 RxDMA

The RxDMA arbitrates among switch requests from each Rx interface. It also buffers the first 64 bytes of each frame for use by the search engine when the switch request has been made.

6.2.4 TxQ Manager

First, the TxQ manager checks the per-class queue status and global reserved resource situation, and using this information, makes the frame dropping decision after receiving a switch response. If the decision is not to drop, the TxQ manager requests that the FCB manager link the unicast frame's FCB to the correct per-port-per-class TxQ. If multicast, the TxQ manager writes to the multicast queue for that port and class. The TxQ manager can also trigger source port flow control for the incoming frame's source if that port is flow control enabled. Second, the TxQ manager handles transmission scheduling; it schedules transmission among the queues representing different classes for a port. Once a frame has been scheduled, the TxQ manager reads the FCB information and writes to the correct port control module.

6.3 Port Control

The port control module calculates the SRAM read address for the frame currently being transmitted. It also writes start of frame information and an end of frame flag to the MAC TxFIFO. When transmission is done, the port control module requests that the buffer be released.

6.4 TxDMA

The TxDMA multiplexes data and address from port control, and arbitrates among buffer release requests from the port control modules.

7.0 Quality of Service and Flow Control

7.1 Model

Quality of service is an all-encompassing term for which different people have different interpretations. In general, the approach to quality of service described here assumes that we do not know the offered traffic pattern. We also assume that the incoming traffic is not policed or shaped. Furthermore, we assume that the network manager knows his applications, such as voice, file transfer, or web browsing, and their relative importance. The manager can then subdivide the applications into classes and set up a service contract with each. The contract may consist of bandwidth or latency assurances per class. Sometimes it may even reflect an estimate of the traffic mix offered to the switch. As an added bonus, although we do not assume anything about the arrival pattern, if the incoming traffic is policed or shaped, we may be able to provide additional assurances about our switch's performance.

Table 6 shows examples of QoS applications with three transmission priorities, but best effort (P0) traffic may form a fourth class with no bandwidth or latency assurances. Gigabit ports actually have eight total transmission priorities.

Goals	Total Assured Bandwidth (user defined)	Low Drop Probability (low-drop)	High Drop Probability (high-drop)
Highest transmission priority, P3	50 Mbps	Apps: phone calls, circuit emulation. Latency: < 1 ms. Drop: No drop if P3 not oversubscribed.	Apps: training video. Latency: < 1 ms. Drop: No drop if P3 not oversubscribed; first P3 to drop otherwise.
Middle transmission priority, P2	37.5 Mbps	Apps: interactive apps, Web business. Latency: < 4-5 ms. Drop: No drop if P2 not oversubscribed.	Apps: non-critical interactive apps. Latency: < 4-5 ms. Drop: No drop if P2 not oversubscribed; firstP2 to drop otherwise.
Low transmission priority, P1	12.5 Mbps	Apps: emails, file backups. Latency: < 16 ms desired, but not critical. Drop: No drop if P1 not oversubscribed.	Apps: casual web browsing. Latency: < 16 ms desired, but not critical. Drop: No drop if P1 not oversubscribed; first to drop otherwise.
Total	100 Mbps		

Table 3 - Two-dimensional World Traffic

A class is capable of offering traffic that exceeds the contracted bandwidth. A well-behaved class offers traffic at a rate no greater than the agreed-upon rate. By contrast, a misbehaving class offers traffic that exceeds the agreed-upon rate. A misbehaving class is formed from an aggregation of misbehaving microflows. To achieve high link utilization, a misbehaving class is allowed to use any idle bandwidth. However, such leniency must not degrade the quality of service (QoS) received by well-behaved classes.

As Table 6 illustrates, the six traffic types may each have their own distinct properties and applications. As shown, classes may receive bandwidth assurances or latency bounds. In the table, P3, the highest transmission class, requires that all frames be transmitted within 1 ms, and receives 50% of the 100 Mbps of bandwidth at that port.

Best-effort (P0) traffic forms a fourth class that only receives bandwidth when none of the other classes have any traffic to offer. It is also possible to add a fourth class that has strict priority over the other three; if this class has even one frame to transmit, then it goes first. In the ZL50417, each 10/100 Mbps port will support four total classes, and each 1000 Mbps port will support eight classes. We will discuss the various modes of scheduling these classes in the next section.

In addition, each transmission class has two subclasses, high-drop and low-drop. Well-behaved users should rarely lose packets. But poorly behaved users – users who send frames at too high a rate – will encounter frame loss, and the first to be discarded will be high-drop. Of course, if this is insufficient to resolve the congestion, eventually some low-drop frames are dropped, and then all frames in the worst case.

Table 6 shows that different types of applications may be placed in different boxes in the traffic table. For example, casual web browsing fits into the category of high-loss, high-latency-tolerant traffic, whereas VoIP fits into the category of low-loss, low-latency traffic.

7.2 Four QoS Configurations

There are four basic pieces to QoS scheduling in the ZL50417: strict priority (SP), delay bound, weighted fair queuing (WFQ), and best effort (BE). Using these four pieces, there are four different modes of operation, as shown in the tables below. For 10/100 Mbps ports, the following registers select these modes:

QOSC24 [7:6]_CREDIT_C00

QOSC28 [7:6]_CREDIT_C10

QOSC32 [7:6]_CREDIT_C20

QOSC36 [7:6]_CREDIT_C30

	P3	P2	P1	P0
Op1 (default)	Delay Bound			BE
Op2	SP	Delay Bound		BE
Op3	SP	WFQ		
Op4	WFQ			

Table 4 - Four QoS Configurations for a 10/100 Mbps Port

QOSC40 [7:6] and QOSC48 [7:6] select these modes for the first and second gigabit ports, respectively.

	P7	P6	P5	P4	P3	P2	P1	P0
Op1 (default)	Delay Bound						BE	
Op2	SP		Delay Bound				BE	
Op3	SP		WFQ					
Op4	WFQ							

Table 5 - Four QoS Configurations for a Gigabit Port

The default configuration for a 10/100 Mbps port is three delay-bounded queues and one best-effort queue. The delay bounds per class are 0.8 ms for P3, 3.2 ms for P2, and 12.8 ms for P1. For a 1 Gbps port, we have a default of six delay-bounded queues and two best-effort queues. The delay bounds for a 1 Gbps port are 0.16 ms for P7 and P6, 0.32 ms for P5, 0.64 ms for P4, 1.28 ms for P3, and 2.56 ms for P2. Best effort traffic is only served when there is no delay-bounded traffic to be served. For a 1 Gbps port, where there are two best-effort queues, P1 has strict priority over P0.

We have a second configuration for a 10/100 Mbps port in which there is one strict priority queue, two delay bounded queues, and one best effort queue. The delay bounds per class are 3.2 ms for P2 and 12.8 ms for P1. If the user is to choose this configuration, it is important that P3 (SP) traffic be either policed or implicitly bounded (e.g. if the incoming P3 traffic is very light and predictably patterned). Strict priority traffic, if not admission-controlled at a prior stage to the ZL50417, can have an adverse effect on all other classes' performance. For a 1 Gbps port, P7 and P6 are both SP classes, and P7 has strict priority over P6. In this case, the delay bounds per class are 0.32 ms for P5, 0.64 ms for P4, 1.28 ms for P3, and 2.56 ms for P2.

The third configuration for a 10/100 Mbps port contains one strict priority queue and three queues receiving a bandwidth partition via WFQ. As in the second configuration, strict priority traffic needs to be carefully controlled. In the fourth configuration, all queues are served using a WFQ service discipline.

7.3 Delay Bound

In the absence of a sophisticated QoS server and signaling protocol, the ZL50417 may not know the mix of incoming traffic ahead of time. To cope with this uncertainty, our delay assurance algorithm dynamically adjusts its scheduling and dropping criteria, guided by the queue occupancies and the due dates of their head-of-line (HOL) frames. As a result, we assure latency bounds for all admitted frames with high confidence, even in the presence of system-wide congestion. Our algorithm identifies misbehaving classes and intelligently discards frames at no detriment to well-behaved classes. Our algorithm also differentiates between high-drop and low-drop traffic with a weighted random early drop (WRED) approach. Random early dropping prevents congestion by randomly dropping a percentage of high-drop frames even before the chip's buffers are completely full, while still largely sparing low-drop frames. This allows high-drop frames to be discarded early, as a sacrifice for future low-drop frames. Finally, the delay bound algorithm also achieves bandwidth partitioning among classes.

7.4 Strict Priority and Best Effort

When strict priority is part of the scheduling algorithm, if a queue has even one frame to transmit, it goes first. Two of our four QoS configurations include strict priority queues. The goal is for strict priority classes to be used for IETF expedited forwarding (EF), where performance guarantees are required. As we have indicated, it is important that strict priority traffic be either policed or implicitly bounded, so as to keep from harming other traffic classes.

When best effort is part of the scheduling algorithm, a queue only receives bandwidth when none of the other classes have any traffic to offer. Two of our four QoS configurations include best effort queues. The goal is for best effort classes to be used for non-essential traffic, because we provide no assurances about best effort performance. However, in a typical network setting, much best effort traffic will indeed be transmitted, and with an adequate degree of expediency.

Because we do not provide any delay assurances for best effort traffic, we do not enforce latency by dropping best effort traffic. Furthermore, because we assume that strict priority traffic is carefully controlled before entering the ZL50417, we do not enforce a fair bandwidth partition by dropping strict priority traffic. To summarize, dropping to enforce bandwidth or delay does not apply to strict priority or best effort queues. We only drop frames from best effort and strict priority queues when global buffer resources become scarce.

7.5 Weighted Fair Queuing

In some environments – for example, in an environment in which delay assurances are not required, but precise bandwidth partitioning on small time scales is essential, WFQ may be preferable to a delay-bounded scheduling discipline. The ZL50417 provides the user with a WFQ option with the understanding that delay assurances can not be provided if the incoming traffic pattern is uncontrolled. The user sets four WFQ “weights” (eight for Gigabit ports) such that all weights are whole numbers and sum to 64. This provides per-class bandwidth partitioning with error within 2%.

In WFQ mode, though we do not assure frame latency, the ZL50417 still retains a set of dropping rules that helps to prevent congestion and trigger higher level protocol end-to-end flow control.

As before, when strict priority is combined with WFQ, we do not have special dropping rules for the strict priority queues, because the input traffic pattern is assumed to be carefully controlled at a prior stage. However, we do indeed drop frames from SP queues for global buffer management purposes. In addition, queue P0 for a 10/100 port (and queues P0 and P1 for a Gigabit port) are treated as best effort from a dropping perspective, though they still are assured a percentage of bandwidth from a WFQ scheduling perspective. What this means is that these particular queues are only affected by dropping when the global buffer count becomes low.

7.6 Shaper

Although traffic shaping is not a primary function of the ZL50417, the chip does implement a shaper for expedited forwarding (EF). Our goal in shaping is to control the peak and average rate of traffic exiting the ZL50417. Shaping is limited to the two Gigabit ports only, and only to class P6 (the second highest priority). This means that class P6 will be the class used for EF traffic. If shaping is enabled for P6, then P6 traffic must be scheduled using strict priority. With reference to Table 8, only the middle two QoS configurations may be used.

Peak rate is set using a programmable whole number, no greater than 64. For example, if the setting is 32, then the peak rate for shaped traffic is 32/64 * 1000 Mbps = 500 Mbps. Average rate is also a programmable whole number, no greater than 64, and no greater than the peak rate. For example, if the setting is 16, then the average rate for shaped traffic is 16/64 * 1000 Mbps = 250 Mbps. As a consequence of the above settings in our example, shaped traffic will exit the ZL50417 at a rate always less than 500 Mbps, and averaging no greater than 250 Mbps. See Programming QoS Register application note for more information.

Also, when shaping is enabled, it is possible for a P6 queue to explode in length if fed by a greedy source. The reason is that a shaper is by definition not work-conserving; that is, it may hold back from sending a packet even if the line is idle. Though we do have global resource management, we do nothing to prevent this situation locally. We assume SP traffic is policed at a prior stage to the ZL50417.

7.7 WRED Drop Threshold Management Support

To avoid congestion, the Weighted Random Early Detection (WRED) logic drops packets according to specified parameters. The following table summarizes the behavior of the WRED logic.

In KB (kilobytes)	P3	P2	P1	High Drop	Low Drop
Level 1 N >= 120	P3 ≥ A KB	P2 ≥ B KB	P1 ≥ C KB	X%	0%
Level 2 N >= 140				Y%	Z%
Level 3 N >= 160				100%	100%

Figure 11 - Summary of the Behaviour of the WRED Logic

Px is the total byte count, in the priority queue x. The WRED logic has three drop levels, depending on the value of N, which is based on the number of bytes in the priority queues. If delay bound scheduling is used, N equals P3*16+P2*4+P1. If using WFQ scheduling, N equals P3+P2+P1. Each drop level from one to three has defined high-drop and low-drop percentages, which indicate the minimum and maximum percentages of the data that can be discarded. The X, Y Z percent can be programmed by the register RDRC0, RDRC1. In Level 3, all packets are dropped if the bytes in each priority queue exceed the threshold. Parameters A, B, C are the byte count thresholds for each priority queue. They can be programmed by the QOS control register (refer to the register group 5). See Programming QoS Registers application note for more information.

7.8 Buffer Management

Because the number of FDB slots is a scarce resource, and because we want to ensure that one misbehaving source port or class cannot harm the performance of a well-behaved source port or class, we introduce the concept of buffer management into the ZL50417. Our buffer management scheme is designed to divide the total buffer space into numerous reserved regions and one shared pool, as shown in Figure 12 on page 33.

As shown in the figure, the FDB pool is divided into several parts. A reserved region for temporary frames stores frames prior to receiving a switch response. Such a temporary region is necessary, because when the frame first enters the ZL50417, its destination port and class are as yet unknown, and so the decision to drop or not needs to be temporarily postponed. This ensures that every frame can be received first before subjecting them to the frame drop discipline after classifying.

Six reserved sections, one for each of the first six priority classes, ensure a programmable number of FDB slots per class. The lowest two classes do not receive any buffer reservation. Furthermore, even for 10/100 Mbps ports, a frame is stored in the region of the FDB corresponding to its class. As we have indicated, the eight classes use only four transmission scheduling queues for 10/100 Mbps ports, but as far as buffer usage is concerned, there are still eight distinguishable classes.

Another segment of the FDB reserves space for each of the 18 ports. Two parameters can be set, one for the source port reservation for 10/100 Mbps ports, and one for the source port reservation for 1 Gbps ports. These 18 reserved regions make sure that no well-behaved source port can be blocked by another misbehaving source port.

In addition, there is a shared pool, which can store any type of frame. The frame engine allocates the frames first in the six priority sections. When the priority section is full or the packet has priority 1 or 0, the frame is allocated in the shared poll. Once the shared poll is full the frames are allocated in the section reserved for the source port.

The following registers define the size of each section of the Frame data Buffer:

PR100- Port Reservation for 10/100 Ports

PRG- Port Reservation for Giga Ports

SFCB- Share FCB Size

C2RS- Class 2 Reserve Size

C3RS- Class 3 Reserve Size

C4RS- Class 4 Reserve Size

C5RS- Class 5 Reserve Size

C6RS- Class 6 Reserve Size

C7RS- Class 7 Reserve Size

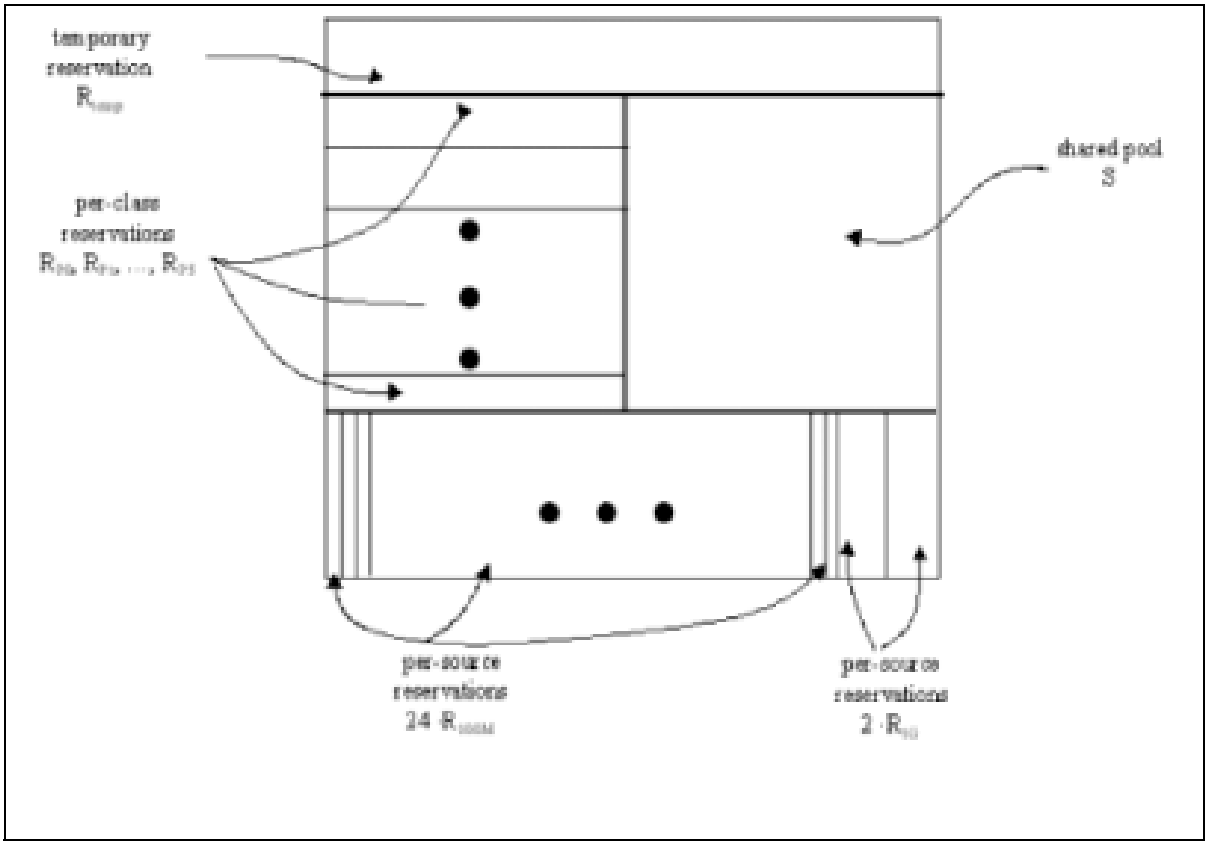

Figure 12 - Buffer Partition Scheme Used to Implement Buffer Management

7.8.1 Dropping When Buffers Are Scarce

Summarizing the two examples of local dropping discussed earlier in this chapter:

If a queue is a delay-bounded queue, we have a multilevel WRED drop scheme, designed to control delay and partition bandwidth in case of congestion.

If a queue is a WFQ-scheduled queue, we have a multilevel WRED drop scheme, designed to prevent congestion.

In addition to these reasons for dropping, we also drop frames when global buffer space becomes scarce. The function of buffer management is to make sure that such dropping causes as little blocking as possible.

7.9 ZL50417 Flow Control Basics

Because frame loss is unacceptable for some applications, the ZL50417 provides a flow control option. When flow control is enabled, scarcity of buffer space in the switch may trigger a flow control signal; this signal tells a source port that is sending a packet to this switch, to temporarily hold off.

While flow control offers the clear benefit of no packet loss, it also introduces a problem for quality of service. When a source port receives an Ethernet flow control signal, all microflows originating at that port, well-behaved or not, are halted. A single packet destined for a congested output can block other packets destined for uncongested outputs. The resulting head-of-line blocking phenomenon means that quality of service cannot be assured with high confidence when flow control is enabled.

In the ZL50417, each source port can independently have flow control enabled or disabled. For flow control enabled ports, by default all frames are treated as lowest priority during transmission scheduling. This is done so that those frames are not exposed to the WRED Dropping scheme. Frames from flow control enabled ports feed to only one queue at the destination, the queue of lowest priority. What this means is that if flow control is enabled for a given source port, then we can guarantee that no packets originating from that port will be lost, but at the possible expense of minimum bandwidth or maximum delay assurances. In addition, these “downgraded” frames may only use the shared pool or the per-source reserved pool in the FDB; frames from flow control enabled sources may not use reserved FDB slots for the highest six classes (P2-P7).

The ZL50417 does provide a system-wide option of permitting normal QoS scheduling (and buffer use) for frames originating from flow control enabled ports. When this programmable option is active, it is possible that some packets may be dropped, even though flow control is on. The reason is that intelligent packet dropping is a major component of the ZL50417’s approach to ensuring bounded delay and minimum bandwidth for high priority flows.

7.9.1 Unicast Flow Control

For unicast frames, flow control is triggered by source port resource availability. Recall that the ZL50417’s buffer management scheme allocates a reserved number of FDB slots for each source port. If a programmed number of a source port’s reserved FDB slots have been used, then flow control Xoff is triggered.

Xon is triggered when a port is currently being flow controlled, and all of that port’s reserved FDB slots have been released.

Note that the ZL50417’s per-source-port FDB reservations assure that a source port that sends a single frame to a congested destination will not be flow controlled.

7.9.2 Multicast Flow Control

In unmanaged mode, flow control for multicast frames is triggered by a global buffer counter. When the system exceeds a programmable threshold of multicast packets, Xoff is triggered. Xon is triggered when the system returns below this threshold.

In addition, each source port has a 18-bit port map recording which port or ports of the multicast frame’s fanout were congested at the time Xoff was triggered. All ports are continuously monitored for congestion, and a port is identified as uncongested when its queue occupancy falls below a fixed threshold. When all those ports that were originally marked as congested in the port map have become uncongested, then Xon is triggered, and the 18-bit vector is reset to zero.

7.10 Mapping to IETF Diffserv Classes

The mapping between priority classes discussed in this chapter and elsewhere is shown below.

ZL504xx	P7	P6	P5	P4	P3	P2	P1	P0
IETF	NM	EF	AF0	AF1	AF2	AF3	BE0	BE1

Table 6 - Mapping between ZL50417 and IETF Diffserv Classes for Gigabit Ports

As the table illustrates, P7 is used solely for network management (NM) frames. P6 is used for expedited forwarding service (EF). Classes P2 through P5 correspond to an assured forwarding (AF) group of size 4. Finally, P0 and P1 are two best effort (BE) classes.

For 10/100 Mbps ports, the classes of Table 7 are merged in pairs—one class corresponding to NM+EF, two AF classes, and a single BE class.

ZL504xx	P3	P2	P1	P0
IETF	NM+EF	AF0	AF1	BE0

Table 7 - Mapping between ZL50417 and IETF Diffserv Classes for 10/100 Ports

Features of the ZL50417 that correspond to the requirements of their associated IETF classes are summarized in the table below.

Network management (NM) and Expedited forwarding (EF)	Global buffer reservation for NM and EF Shaper for EF traffic on 1 Gbps ports Option of strict priority scheduling No dropping if admission controlled
Assured forwarding (AF)	Four AF classes for 1 Gbps ports Programmable bandwidth partition, with option of WFQ service Option of delay-bounded service keeps delay under fixed levels even if not admission-controlled Random early discard, with programmable levels Global buffer reservation for each AF class
Best effort (BE)	Two BE classes for 1 Gbps ports Service only when other queues are idle means that QoS not adversely affected Random early discard, with programmable levels Traffic from flow control enabled ports automatically classified as BE

Table 8 - ZL50417 Features Enabling IETF Diffserv Standards

8.0 Port Trunking

8.1 Features and Restrictions

A port group (i.e. trunk) can include up to 4 physical ports, but when using stack all of the ports in a group must be in the same ZL50417.

The two Gigabit ports may also be trunked together. There are three trunk groups total, including the option to trunk Gigabit ports.

Load distribution among the ports in a trunk for unicast is performed using hashing based on source MAC address and destination MAC address. Three other options include source MAC address only, destination MAC address only, and source port (in bidirectional ring mode only). Load distribution for multicast is performed similarly.

The ZL50417 also provides a safe fail-over mode for port trunking automatically. If one of the ports in the trunking group goes down, the ZL50417 will automatically redistribute the traffic over to the remaining ports in the trunk.

8.2 Unicast Packet Forwarding

The search engine finds the destination MCT entry, and if the status field says that the destination port found belongs to a trunk, then the group number is retrieved instead of the port number. In addition, if the source address belongs to a trunk, then the source port's trunk membership register is checked.

A hash key, based on some combination of the source and destination MAC addresses for the current packet, selects the appropriate forwarding port, as specified in the Trunk_Hash registers.

8.3 Multicast Packet Forwarding

For multicast packet forwarding, the device must determine the proper set of ports from which to transmit the packet based on the VLAN index and hash key.

Two functions are required in order to distribute multicast packets to the appropriate destination ports in a port trunking environment.

Determining one forwarding port per group.

Preventing the multicast packet from looping back to the source trunk.

The search engine needs to prevent a multicast packet from sending to a port that is in the same trunk group with the source port. This is because, when we select the primary forwarding port for each group, we do not take the source port into account. To prevent this, we simply apply one additional filter, so as to block that forwarding port for this multicast packet.

8.4 Trunking

In this mode, 3 trunk groups are supported. Groups 0 and 1 can trunk up to 4 10/100 ports. Group 2 can trunk 2 Gigabit ports. The supported combinations are shown in the following table.

Group 0	Port 0	Port 1	Port 2	Port 3
	✔	✔		
	✔	✔	✔	
	✔	✔	✔	✔

Table 9 - Select via trunk0_mode register

Group 1	Port 4	Port 5	Port 6	Port 7
	✔	✔		
	✔	✔	✔	✔

Table 10 - Select via trunk1_mode register

Group 2	Port 25(Giga 0)	Port 26 (Giga 1)
	✔	✔

Table 11 - Individually Enabled/disabled

The trunks are individually enabled/disabled by controlling pin trunk 0,1,2.

9.0 Port Mirroring

9.1 Port Mirroring Features

The received or transmitted data of any 10/100 port in the ZL50417 chip can be “mirrored” to any other port. We support two such mirrored source-destination pairs. A mirror port can not also serve as a data port.

9.2 Setting Registers for Port Mirroring

MIRROR1_SRC: Sets the source port for the first port mirroring pair. Bits [4:0] select the source port to be mirrored. An illegal port number is used to disable mirroring (which is the default setting). Bit [5] is used to select between ingress (Rx) or egress (Tx) data.

MIRROR1_DEST: Sets the destination port for the first port mirroring pair. Bits [4:0] select the destination port to be mirrored.

MIRROR2_SRC: Sets the source port for the second port mirroring pair. Bits [4:0] select the source port to be mirrored. An illegal port number is used to disable mirroring (which is the default setting). Bit [5] is used to select between ingress (Rx) or egress (Tx) data.

MIRROR2_DEST: Sets the destination port for the second port mirroring pair. Bits [4:0] select the destination port to be mirrored. The default is port 0.

Refer to Port Mirroring Application Notes for further information.

10.0 TBI Interface

10.1 TBI Connection

The TBI interface can be used for 1000Mbps fiber operation. In this mode, the ZL50417 is connected to the Serdes as shown in Figure 13. There are two TBI interfaces in the ZL50417 devices. To enable to TBI function, the corresponding TXEN and TXER pins need to be boot strapped. See Ball – Signal Description for details.

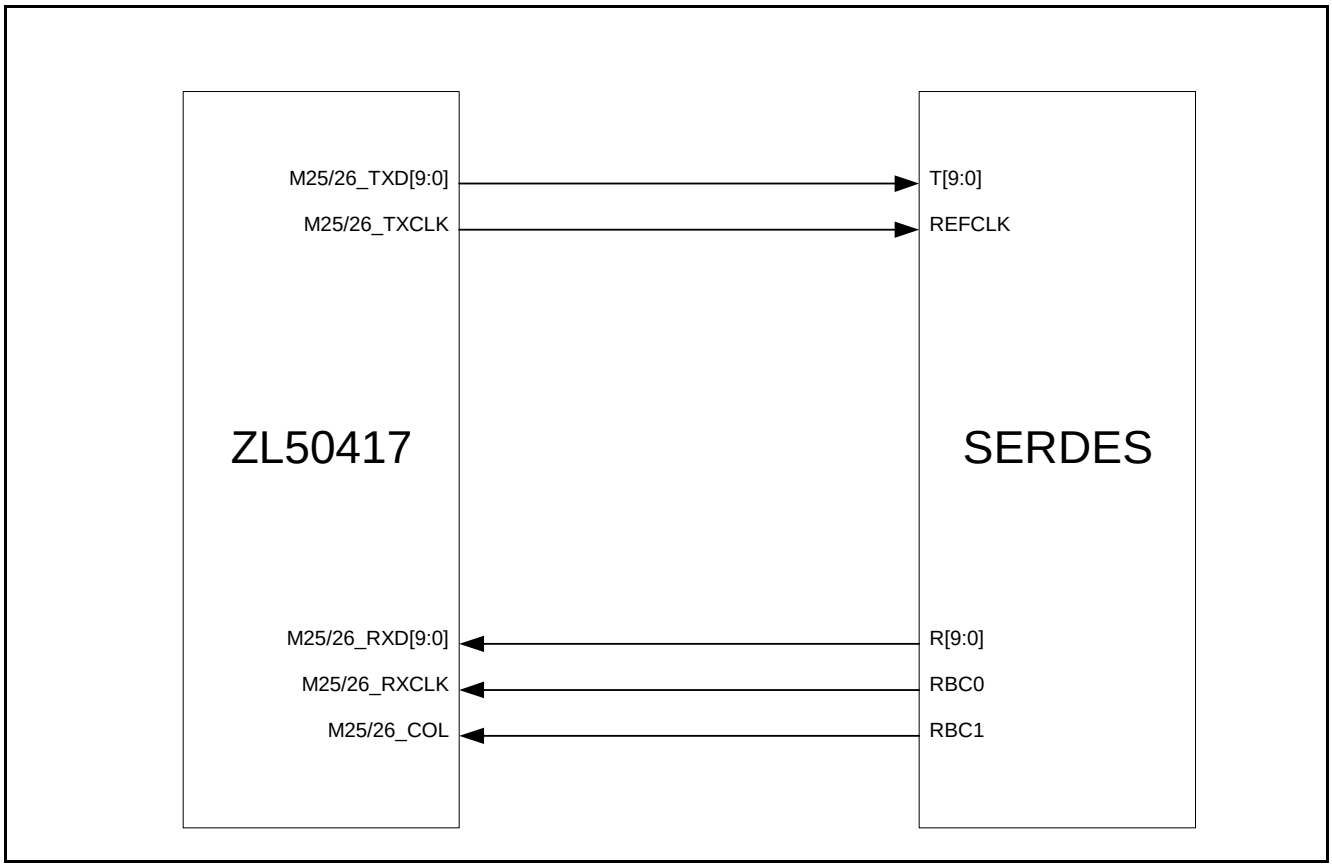

Figure 13 - TBI Connection

11.0 GPSI (7WS) Interface

11.1 GPSI connection

The 10/100 RMII ethernet port can function in GPSI (7WS) mode when the corresponding TXEN pin is strapped low with a 1K pull down resistor. In this mode, the TXD[0], TXD[1], RXD[0] and RXD[1] serve as TX data, TX clock, RX data and RX clock respectively. The link status and collision from the PHY are multiplexed and shifted into the switch device through external glue logic. The duplex of the port can be controlled by programming the ECR register. The GPSI interface can be operated in port based VLAN mode only.

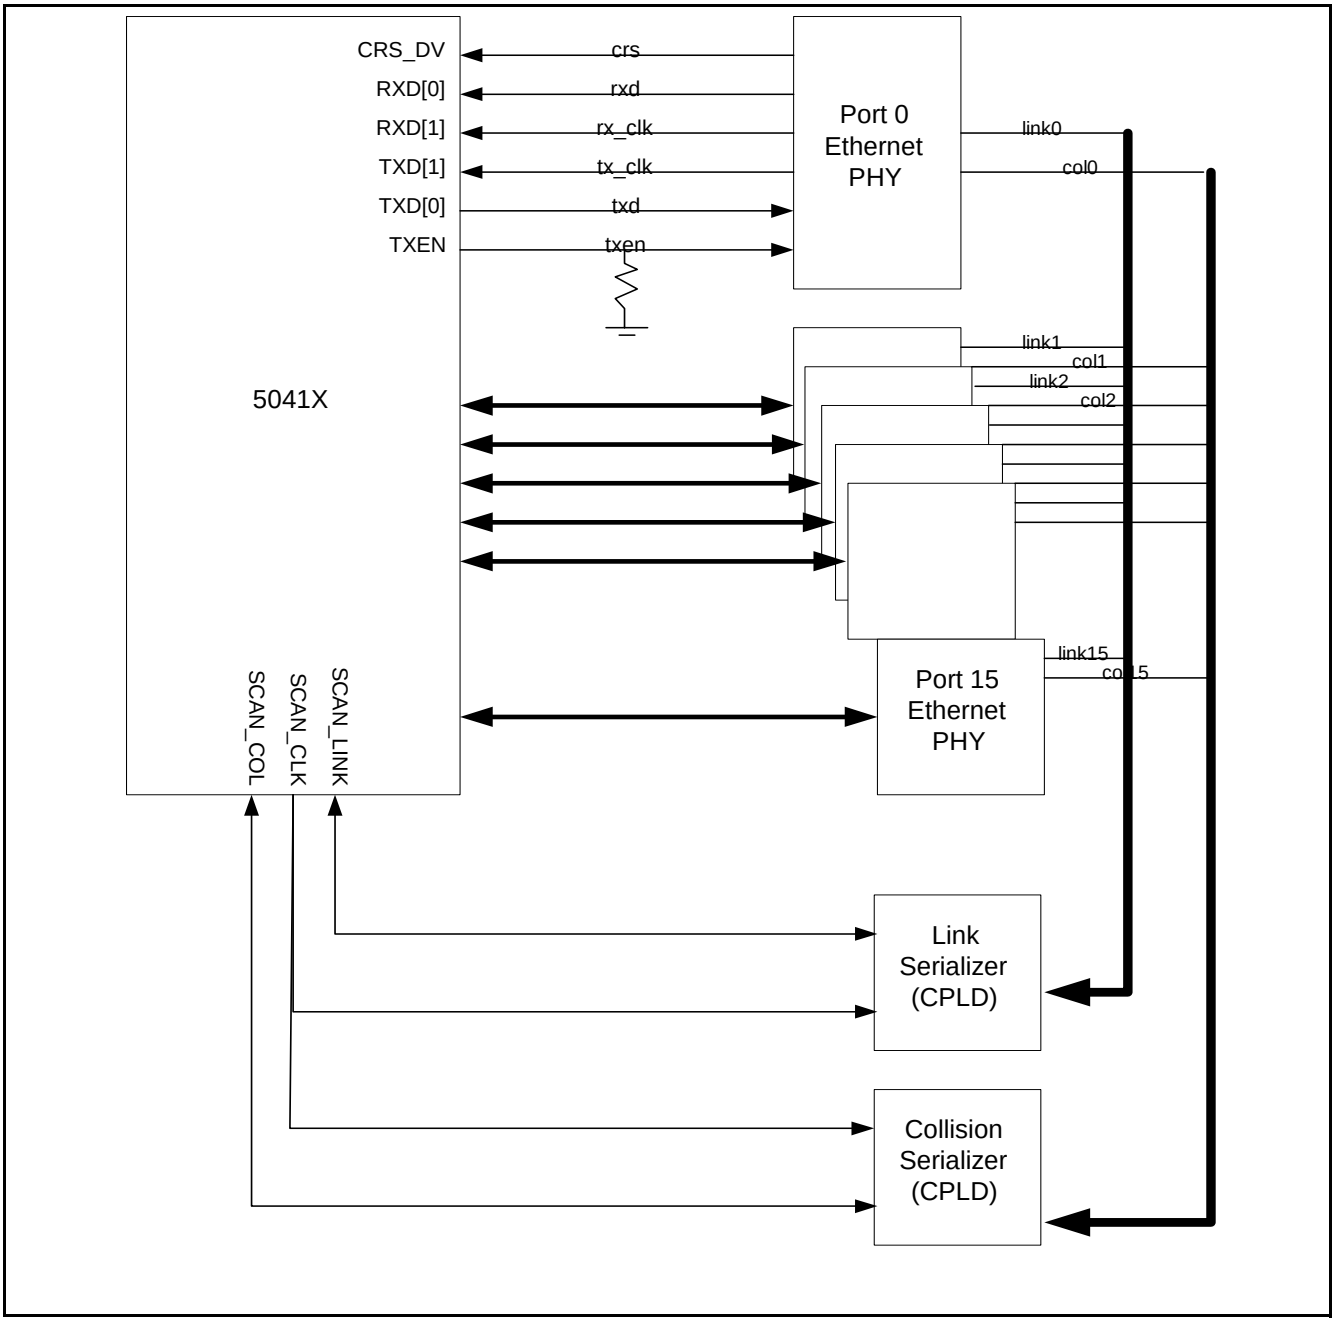

Figure 14 - GPSI (7WS) mode connection diagram

11.2 SCAN LINK and SCAN COL interface

An external CPLD logic is required to take the link signals and collision signals from the GPSI PHYS and shift them into the switch device. The switch device will drive out a signature to indicate the start of the sequence. After that, the CPLD should shift in the link and collision status of the PHYS as shown in the figure. The extra link status indicates the polarity of the link signal. One indicates the polarity of the link signal is active high.

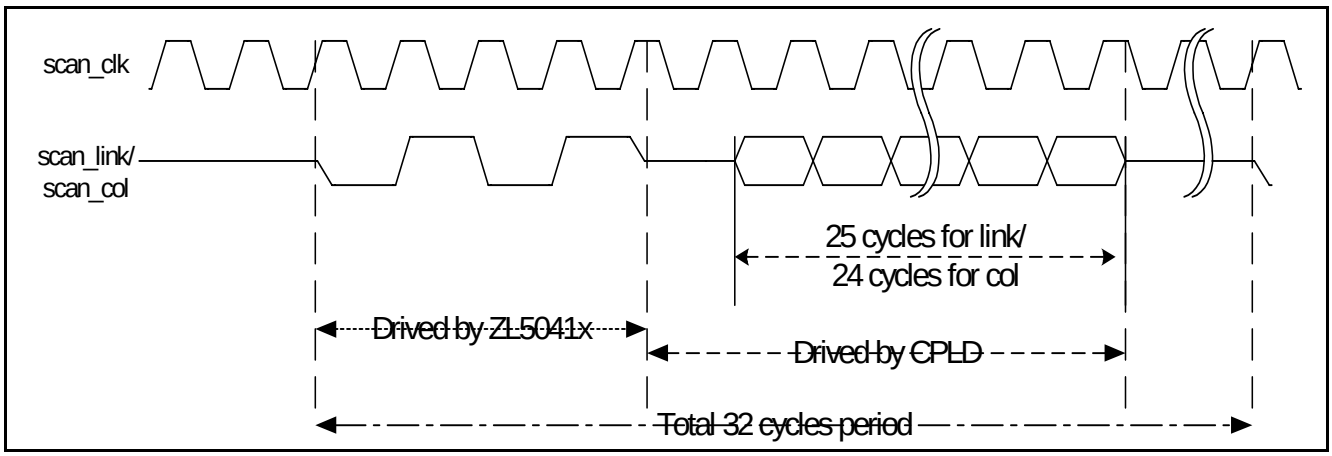

Figure 15 - SCAN LINK and SCAN COLLISON status diagram

12.0 LED Interface

12.1 LED Interface Introduction

A serial output channel provides port status information from the ZL50417 chips. It requires three additional pins.

LED_CLK at 12.5 MHz

LED_SYN a sync pulse that defines the boundary between status frames

LED_DATA a continuous serial stream of data for all status LEDs that repeats once every frame time

A non-serial interface is also allowed, but in this case, only the Gigabit ports will have status LEDs.

A low cost external device (44 pin PAL) is used to decode the serial data and to drive an LED array for display. This device can be customized for different needs.

12.2 Port Status

In the ZL50417, each port has 8 status indicators, each represented by a single bit. The 8 LED status indicators are:

- Bit 0: Flow control
- Bit 1:Transmit data
- Bit 2: Receive data
- Bit 3: Activity (where activity includes either transmission or reception of data)
- Bit 4: Link up
- Bit 5: Speed (1= 100 Mb/s; 0= 10 Mb/s)

- Bit 6: Full-duplex
- Bit 7: Collision

Eight clocks are required to cycle through the eight status bits for each port.

When the LED_SYN pulse is asserted, the LED interface will present 256 LED clock cycles with the clock cycles providing information for the following ports.

- Port 0 (10/100): cycles #0 to cycle #7
- Port 1 (10/100): cycles#8 to cycle #15
- Port 2 (10/100): cycle #16 to cycle #23
- ...
- Port 14 (10/100): cycle #112 to cycle #119
- Port 15 (10/100): cycle #120 to cycle #127
- Port 25 (Gigabit 1): cycle #192 to cycle #199
- Port 26 (Gigabit 2): cycle #200 to cycle #207
- Byte 26 (additional status): cycle #208 to cycle #215
- Byte 27 (additional status): cycle #216 to cycle #223

Cycles #224 to 256 present data with a value of zero.

The first two bits of byte 26 provides the speed information for the Gigabit ports while the remainder of byte 26 and byte 27 provides bist status

- 26[0]: G0 port (1= port 24 is operating at Gigabit speed; 0= speed is either 10 or 100 Mb/s depending on speed bit of Port 24)
- 26[1]: G1 port (1= port 25 is operating at Gigabit speed; 0= speed is either 10 or 100 Mb/s depending on speed bit of Port 25)
- 26[2]: initialization done
- 26[3]: initialization start
- 26[4]: checksum ok
- 26[5]: link_init_complete
- 26[6]: bist_fail
- 26[7]: ram_error
- 27[0]: bist_in_process
- 27[1]: bist_done

12.3 LED Interface Timing Diagram

The signal from the ZL50417 to the LED decoder is shown in Figure 16.

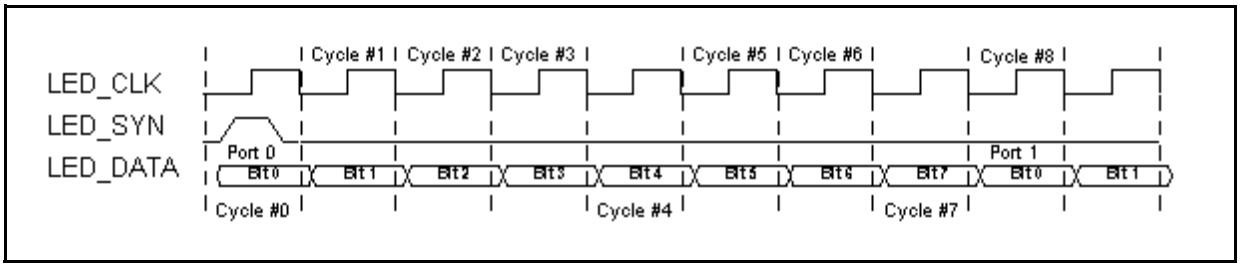

Figure 16 - Timing Diagram of LED Interface

13.0 Register Definition

13.1 ZL50417 Register Description

Register	Description	CPU Addr (Hex)	R/W	I²C Addr (Hex)	Default	Notes
0. ETHERNET Port Control Registers Substitute [N] with Port number (0..F, 18-1A)						
ECR1P"N"	Port Control Register 1 for Port N	0000 + 2 x N	R/W	000-01A	020	
ECR2P"N"	Port Control Register 2 for Port N	001 + 2 x N	R/W	01B-035	000	
GGC	Extra GIGA bit control register	036	R/W	NA	000	
1. VLAN Control Registers Substitute [N] with Port number (0..F, 18-1A)						
AVTCL	VLAN Type Code Register Low	100	R/W	036	000	
AVTCH	VLAN Type Code Register High	101	R/W	037	081	
PVMAP"N"_0	Port "N" Configuration Register 0	102 + 4N	R/W	038-052	0FF	
PVMAP"N"_1	Port "N" Configuration Register 1	103 + 4N	R/W	053-06D	0FF	
PVMAP"N"_3	Port "N" Configuration Register 3	105 + 4N	R/W	089-0A3	007	
PVMODE	VLAN Operating Mode	170	R/W	0A4	000	
PVROUTE7-0	VLAN Router Group Enable	171-178	R/W	NA	000	
2. TRUNK Control Registers						
TRUNK0_ MODE	Trunk Group 0 Mode	203	R/W	0A5	003	
3. CPU Port Configuration						
RQSS	Receive Queue Status	324	RO	NA	N/A	
TX_AGE	Transmission Queue Aging Time	325	R/W	0A7	008	
4. Search Engine Configurations						
AGETIME_LOW	MAC Address Aging Time Low	400	R/W	0A8	2M:05C/ 4M:02E	
AGETIME_ HIGH	MAC Address Aging Time High	401	R/W	0A9	000	
SE_OPMODE	Search Engine Operating Mode	403	R/W	NA	000	
5. Buffer Control and QOS Control						
FCBAT	FCB Aging Timer	500	R/W	0AA	0FF	
QOSC	QOS Control	501	R/W	0AB	000	

Register	Description	CPU Addr (Hex)	R/W	I²C Addr (Hex)	Default	Notes
FCR	Flooding Control Register	502	R/W	0AC	008	
AVPML	VLAN Priority Map Low	503	R/W	0AD	000	
AVPMM	VLAN Priority Map Middle	504	R/W	0AE	000	
AVPMH	VLAN Priority Map High	505	R/W	0AF	000	
TOSPML	TOS Priority Map Low	506	R/W	0B0	000	
TOSPMM	TOS Priority Map Middle	507	R/W	0B1	000	
TOSPMH	TOS Priority Map High	508	R/W	0B2	000	
AVDM	VLAN Discard Map	509	R/W	0B3	000	
TOSDML	TOS Discard Map	50A	R/W	0B4	000	
BMRC	Broadcast/Multicast Rate Control	50B	R/W	0B5	000

SUM	EEPROM Checksum Register	60B	R/W	0FF	000	
7. Port Mirroring Controls						
MIRROR1_SRC	Port Mirror 1 Source Port	700	R/W	N/A	07F	
MIRROR1_ DEST	Port Mirror 1 Destination Port	701	R/W	N/A	017	
MIRROR2_SRC	Port Mirror 2 Source Port	702	R/W	N/A	0FF	
MIRROR2_ DEST	Port Mirror 2 Destination Port	703	R/W	N/A	000	
2						
GCR	Global Control Register	F00	R/W	N/A	000	
DCR	Device Status and Signature Register	F01	RO	N/A	N/A	
DCR1	Giga Port status	F02	RO	N/A	N/A	
DPST	Device Port Status Register	F03	R/W	N/A	000	
DTST	Data read back register	F04	RO	N/A	N/A	
DA	DA Register	FFF	RO	N/A	DA	

13.2 (Group 0 Address) MAC Ports Group

13.2.1 ECR1Pn: Port N Control Register

I²C Address 000 - 01A; CPU Address:0000+2xN (N = port number)

Accessed by serial interface and I²C (R/W)

7	6	5	4	3	2	1	0
Sp State		A-FC	Port Mode				

Bit [0]
- 1 - Flow Control Off
- 0 - Flow Control On
- When Flow Control On:
- In half duplex mode, the MAC transmitter applies back pressure for flow control.
- In full duplex mode, the MAC transmitter sends Flow Control frames when necessary. The MAC receiver interprets and processes incoming flow control frames. The Flow Control Frame Received counter is incremented whenever a flow control is received.
- When Flow Control off:
- In half duplex mode, the MAC Transmitter does not assert flow control by sending flow control frames or jamming collision.
- In full duplex mode, the Mac transmitter does not send flow control frames. The MAC receiver does not interpret or process the flow control frames. The Flow Control Frame Received counter is not incremented.

Bit [1]
- 1 - Half Duplex - Only in 10/100 mode
- 0 - Full Duplex

Bit [2]
- 1 - 10Mbps
- 0 - 100Mbps

Bit [4:3]
- 00 – Automatic Enable Auto Neg. - This enables hardware state machine for auto-negotiation.
- 01 - Limited Disable auto Neg. This disables hardware for speed auto-negotiation. Hardware Poll MII for link status.
- 10 - Link Down. Force link down (disable the port).
- 11 - Link Up. The configuration in ECR1[2:0] is used for (speed/half duplex/full duplex/flow control) setup.

Bit [5]
- Asymmetric Flow Control Enable.
- 0 – Disable asymmetric flow control
- 01 – Enable Asymmetric flow control
- When this bit is set, and flow control is on (bit[0] = 0), don’t send out a flow control frame. But MAC receiver interprets and processes flow control frames.

Bit [7:6]
- SS - Spanning tree state (802.1D spanning tree protocol) **Default is 11**.
- 00 – Blocking: Frame is dropped
- 01 - Listening: Frame is dropped
- 10 - Learning: Frame is dropped. Source MAC address is learned.
- 11 - Forwarding: Frame is forwarded. Source MAC address is learned.

13.2.2 ECR2Pn: Port N Control Register

I²C Address: 01B-035; CPU Address:0001+2xN (N = port number)

Accessed by serial interface and I²C (R/W)

7	6	5	4	3	2	1	0
Security En		QoS Sel		Reserve	DisL	Ftf	Futf

Bit[0]:
- Filter untagged frame (**Default 0**)
- 0: Disable
- 1: All untagged frames from this port are discarded or follow security option when security is enable

Bit[1]:
- Filter Tag frame (**Default 0**)
- 0: Disable
- 1: All tagged frames from this port are discarded or follow security option when security is enable

Bit[2]:
- Learning Disable **(Default 0)**
- 1 Learning is disabled on this port
- 0 Learning is enabled on this port

Bit[3]:
- Must be ‘1’

Bit [5:4:]
- QOS mode selection **(Default 00)**
- Determines which of the 4 sets of QoS settings is used for 10/100 ports.
- Note that there are 4 sets of per-queue byte thresholds, and 4 sets of WFQ ratios programmed. These bits select among the 4 choices for each 10/100 port. Refer to QOS Application Note.
- 00: select class byte limit set 0 and classes WFQ credit set 0
- 01: select class byte limit set 1 and classes WFQ credit set 1
- 10: select class byte limit set 2 and classes WFQ credit set 2
- 11: select class byte limit set 3 and classes WFQ credit set 3

Bit[7:6]
- Security Enable **(Default 00).** The ZL50417 checks the incoming data for one of the following conditions:
- If the source MAC address of the incoming packet is in the MAC table and is defined as secure address but the ingress port is not the same as the port associated with the MAC address in the MAC table.

- A MAC address is defined as secure when its entry at MAC table has static status and bit 0 is set to 1. MAC address bit 0 (the first bit transmitted) indicates whether the address is unicast or multicast. As source addresses are always unicast bit 0 is not used (always 0). ZL50417 uses this bit to define secure MAC addresses.
- If the port is set as learning disable and the source MAC address of the incoming packet is not defined in the MAC address table.
- If the port is configured to filter untagged frames and an untagged frame arrives or if the port is configured to filter tagged frames and a tagged frame arrives.
- If the port is configured to filter untagged frames and an untagged frame arrives or if the port is configured to filter tagged frames and a tagged frame arrives.
- If one of these three conditions occurs, the packet will be handled according to one of the following specified options:
- CPU installed
  - 00 – Disable port security
  - 01 – Discard violating packets
  - 10 – Send packet to CPU and destination port
  - 11 – Send packet to CPU only

13.2.3 GGControl – Extra GIGA Port Control

CPU Address:h036

Accessed by CPU and serial interface (R/W)

7	6	5	4	3	2	1	0
DF		MiiB	RstA	DF		MiiA	RstA

Bit[0]:
- Reset GIGA port A
  - 0: Normal operation **(default)**
  - 1: Reset Gigabit port A. Normally used when a new Phy is connected (Hot swap).

Bit[1]:
- GIGA port A use MII interface (10/100M)
  - 0: Gigabit port operations at 1000 mode **(default)**
  - 1: Gigabit port operations at 10/100 mode

Bit[2]:
- Reserved - Must be zero

Bit[3]:
- GIGA port A direct flow control (MAC to MAC connection). The ZL50417 supports direct flow control mechanism; the flow control frame is therefore not sent through the Gigabit port data path.
  - 0: Direct flow control disabled **(default)**
  - 1: Direct flow control enabled

Bit[4]:
- Reset GIGA port B
  - 0: Normal operation **(default)**
  - 1: Reset Gigabit port B

Bit[5]:
- GIGA port B use MII interface (10/100M)
  - 0: Gigabit port operates at 1000 mode **(default)**
  - 1: Gigabit port operates at 10/100 mode

Bit[6]:
- Reserved - Must be zero

Bit[7]:
- GIGA port B direct flow control (MAC to MAC connection). ZL50417 supports direct flow control mechanism; the flow control frame is therefore not sent through the Gigabit port data path.
  - 0: Direct flow control disabled **(default)**
  - 1: Direct flow control enabled

13.3 (Group 1 Address) VLAN Group

13.3.1 AVTCL – VLAN Type Code Register Low

I²C Address 036; CPU Address:h100

Accessed serial interface and I²C (R/W)

Bit[7:0]: VLANType_LOW: Lower 8 bits of the VLAN type code **(Default 00)**

13.3.2 AVTCH – VLAN Type Code Register High

I²C Address 037; CPU Address:h101

Accessed by serial interface and I²C (R/W)

Bit[7:0]: VLANType_HIGH: Upper 8 bits of the VLAN type code **(Default is 81)**

13.3.3 PVMAP00_0 – Port 00 Configuration Register 0

I²C Address 038, CPU Address:h102

Accessed by serial interface and I²C (R/W)

In Port Based VLAN Mode

Bit[7:0]: VLAN Mask for ports 7 to 0 **(Default FF)**

This register indicates the legal egress ports. A “1” on bit 7 means that the packet can be sent to port 7. A “0” on bit 7 means that any packet destined to port 7 will be discarded. This register works with registers 1, 2 and 3 to form a 27 bit mask to all egress ports.

13.3.4 PVMAP00_1 – Port 00 Configuration Register 1

I²C Address h39, CPU Address:h103

Accessed by serial interface and I²C (R/W)

In Port based VLAN Mode

Bit[7:0]: VLAN Mask for ports 15 to 8 **(Default is FF)**

13.3.5 PVMAP00_3 – Port 00 Configuration Register 3

I²C Address h3b, CPU Address:h105)

Accessed by serial interface and I²C (R/W)

In Port Based VLAN Mode

7	6	5 3	2 0
FP en	Drop	Default tx priority	VLAN Mask

Bit [2:0]: VLAN Mask for ports 26 to 24 **(Default 7).**

Bit [5:3]: Default Transmit priority. Used when Bit[7]=1 **(Default 0)**

- 000 Transmit Priority Level 0 (Lowest)
- 001 Transmit Priority Level 1
- 010 Transmit Priority Level 2
- 011 Transmit Priority Level 3
- 100 Transmit Priority Level 4
- 101 Transmit Priority Level 5
- 110 Transmit Priority Level 6
- 111 Transmit Priority Level 7 (Highest)

Bit [6]: Default Discard priority. Used when Bit[7]=1 **(Default 0)**

- 0 - Discard Priority Level 0 (Lowest)
- 1 - Discard Priority Level 1(Highest)

Bit [7]: Enable Fix Priority (**Default 0**)

- 0 Disable fix priority. All frames are analyzed. Transmit Priority and Discard Priority are based on VLAN Tag, TOS or Logical Port.
- 1 Transmit Priority and Discard Priority are based on values programmed in bit [6:3]

13.4 Port Configuration Registers

PVMAP01_0,1,3 I²C Address h3C,3D,3E,3F; CPU Address:h106,107,108,109)

PVMAP08_0,1,3 I²C Address h58,59,5A,5B; CPU Address:h122, 123, 124, 125)

PVMAP09_0,1,3 I²C Address h5C,5D,5E,5F; CPU Address:h126, 127, 128, 129)

PVMAP10_0,1,3 I²C Address h60,61,62,63; CPU Address:h12A, 12B, 12C, 12D)

PVMAP11_0,1,3 I²C Address h64,65,66,67; CPU Address:h12E, 12F, 130, 131)

PVMAP12_0,1,3 I²C Address h68,69,6A,6B; CPU Address:h132, 133, 134, 135)

PVMAP13_0,1,3 I²C Address h6C,6D,6E,6F; CPU Address:h136, 137, 138, 139)

PVMAP14_0,1,3 I²C Address h70,71,72,73; CPU Address:h13A, h13B, 13C, 13D)

PVMAP15_0,1,3 I²C Address h74,75,76,77; CPU Address:h13E, 13F, 140, 141)

PVMAP25_0,1,3 I²C Address h9C,9D,9E,9F; CPU Address:h166, 167, 168, 169) (Gigabit port 1)

PVMAP26_0,1,3 I²C Address hA0,A1,A2,A3; CPU Address:h16A, 16B, 16C, 16D) (Gigabit port 2)

13.4.1 PVMODE

I²C Address: h0A4, CPU Address:h170

Accessed by CPU, serial interface (R/W)

7 5	4	3	2	1	0
	SMO		DL	SL	

Bit [0]:
- Reserved
  - Must be ‘0’

Bit [1]:
- Slow learning (Default = 0)
  Same function as SE_OP MODE bit 7. Either bit can enable the function; both need to be turned off to disable the feature.

Bit [2]:
- Disable dropping frames with destination MAC addresses 0180C2000001 to 0180C200000F (Default = 0)
  - 0: Drop all frames in the range
  - 1: Treats frames as multicast

Bit [3]: • Reserved

Bit [4]: • Support MAC address 0 (Default = 0)
- 0: MAC address 0 is not learned.
- 1: MAC address 0 is learned.

Bit [7:5]: • Reserved

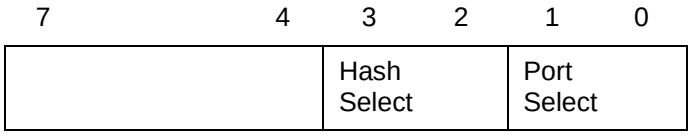
13.5 (Group 2 Address) Port Trunking Groups

Trunk Group 0 - Up to four 10/100 ports can be selected for trunk group 0.

13.5.1 TRUNK0_MODE– Trunk group 0 mode

I²C Address h0A5; CPU Address:203

Accessed by serial interface and I²C (R/W)



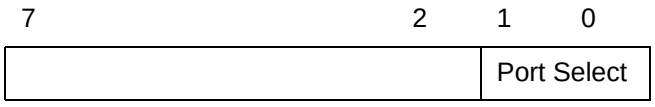
Bit [1:0]: • Port selection in unmanaged mode. Input pin TRUNK0 enable/disable trunk group 0 in unmanaged mode.
- 00 Reserved
- 01 Port 0 and 1 are used for trunk0
- 10 Port 0,1 and 2 are used for trunk0
- 11 Port 0,1,2 and 3 are used for trunk0

Bit [3:2] • Hash Select. The Hash selected is valid for Trunk 0, 1 and 2. (Default 00)
- 00 Use Source and Destination Mac Address for hashing
- 01 Use Source Mac Address for hashing
- 10 Use Destination Mac Address for hashing
- 11 Use source destination MAC address and ingress physical port number for hashing

13.5.2 TRUNK1_MODE – Trunk group 1 mode

I²C Address h0A6; CPU Address:20B

Accessed by serial interface and I²C (R/W)



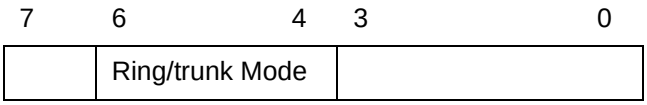
Bit [1:0]:
- Port selection in unmanaged mode. Input pin TRUNK1 enable/disable trunk group 1 in unmanaged mode.
  - 00 Reserved
  - 01 Port 4 and 5 are used for trunk1
  - 10 Reserved
  - 11 Port 4,5,6 and 7 are used for trunk1

Trunk Group 2

13.5.3 TRUNK2_MODE – Trunk group 2 mode (Gigabit ports 1 and 2)

CPU Address:210

Accessed by serial interface (R/W)



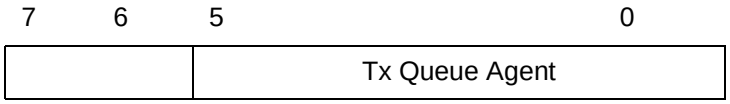
Bit [3:0]
- Reserved

Bit [6:4]
- 000 Normal
- 001 Trunk Mode. Enable Trunk group for Gigabit port 1 and 2 in managed mode. In unmanaged mode Trunk 2 is enable/disable using input pin TRUNK2.
- 010 Single Ring with G1
- 100 Single Ring with G2
- 111 Dual Ring Mode

13.5.4 RQSS – Receive Queue Status

CPU Address:h324

Accessed by serial interface (RO)



Bit[5:0]: Unit of 100ms **(Default 8)**

Disable transmission queue aging if value is zero. Aging timer for all ports and queues.

This register must be set to 0 for ‘No Packet Loss Flow Control Test’.

13.6 (Group 4 Address) Search Engine Group

13.6.1 AGETIME_LOW – MAC address aging time Low

I²C Address h0A8; CPU Address:h400

Accessed by serial interface and I²C (R/W)

Bit [7:0] Low byte of the MAC address aging timer

MAC address aging is enable/disable by boot strap TSTOUT9

13.6.2 AGETIME_HIGH –MAC address aging time High

I²C Address h0A9; CPU Address h401

Accessed by serial interface and I²C (R/W)

Bit [7:0]: High byte of the MAC address aging timer.

The default setting provide 300 seconds aging time. Aging time is based on the following equation:

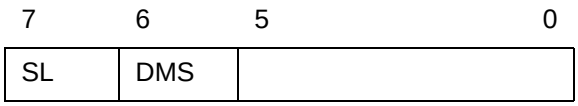
{AGETIME_TIME,AGETIME_LOW} X (# of MAC entries in the memory X100µsec). Number of MAC entries = 32K when 1 MB is used per Bank. Number of entries = 64K when 2 MB is used per Bank.

13.6.3 SE_OPMODE – Search Engine Operation Mode

CPU Address:h403

Accessed by serial interface (R/W)

{SE_OPMODE} X(# of entries 100usec)



Bit [5:0]:
- Reserved

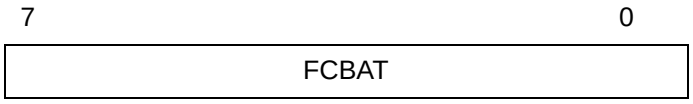
Bit [6]:
- Disable MCT speedup aging (Default 0)
  - 1 – Disable speedup aging when MCT resource is low.
  - 0 – Enable speedup aging when MCT resource is low.

Bit [7]:
- Slow Learning (Default 0)
  - 1– Enable slow learning. Learning is temporary disabled when search demand is high
  - 0 – Learning is performed independent of search demand

13.7 (Group 5 Address) Buffer Control/QOS Group

13.7.1 FCBAT – FCB Aging Timer

I²C Address h0AA; CPU Address:h500

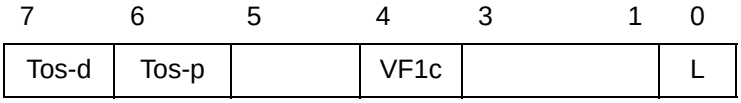


Bit [7:0]:
- FCB Aging time. Unit of 1ms. (Default FF)
- This is for buffer aging control. It is used to configure the buffer aging time. This function can be enabled/disabled through bootstrap pin. It is not suggested to use this function for normal operation.

13.7.2 QOSC – QOS Control

I²C Address h0AB; CPU Address:h501

Accessed by serial interface and I²C (R/W)



Bit [0]:
- QoS frame lost is OK. Priority will be available for flow control enabled source only when this bit is set (Default 0)

Bit [4]:
- Per VLAN Multicast Flow Control (Default 0)
- 0 – Disable
- 1 – Enable

Bit [5]:
- Reserved

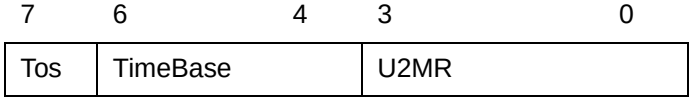
Bit [6]:
- Select TOS bits for Priority (Default 0)
- 0 – Use TOS [4:2] bits to map the transmit priority
- 1 – Use TOS [7:5] bits to map the transmit priority

Bit [7]:
- Select TOS bits for Drop priority (Default 0)
- 0 – Use TOS [4:2] bits to map the drop priority
- 1 – Use TOS [7:5] bits to map the drop priority

13.7.3 FCR – Flooding Control Register

I²C Address h0AC; CPU Address:h502

Accessed by serial interface and I²C (R/W)



Bit [3:0]:
- U2MR: Unicast to Multicast Rate. Units in terms of time base defined in bits [6:4]. This is used to limit the amount of flooding traffic. The value in U2MR specifies how many packets are allowed to flood within the time specified by bit [6:4]. To disable this function, program U2MR to 0. (Default = 8)

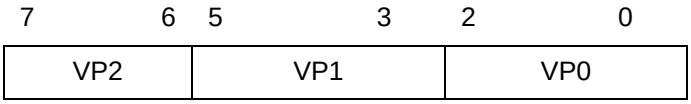
Bit [6:4]: Time Base: (Default = 000)
- 000 = 100us
- 001 = 200us
- 010 = 400us
- 011 = 800us
- 100 = 1.6ms
- 101 = 3.2ms
- 110 = 6.4ms
- **111 = 100us,** same as 000.

Bit [7]: Select VLAN tag or TOS (IP packets) to be preferentially picked to map transmit priority and drop priority (**Default = 0**).
- 0 – Select VLAN Tag priority field over TOS
- 1 – Select TOS over VLAN tag priority field

13.7.4 AVPML – VLAN Priority Map

I²C Address h0AD; CPU Address:h503

Accessed by serial interface and I²C (R/W)



Registers AVPML, AVPMM, and AVPMH allow the eight VLAN Tag priorities to map into eight Internal level transmit priorities. Under the Internal transmit priority, Registers AVPML, AVPMM, and AVPMH allow the eight VLAN priorities to map into eight internal level transmit priorities. Under the internal transmit priority, seven is highest priority where as zero is the lowest. This feature allows the user the flexibility of redefining the VLAN priority field. For example, programming a value of 7 into bit 2:0 of the AVPML register would map VLAN priority 0 into internal transmit priority 7. The new priority is used inside the ZL50417. When the packet goes out it carries the original priority.

Bit [2:0]: Priority when the VLAN tag priority field is 0 **(Default 0)**

Bit [5:3]: Priority when the VLAN tag priority field is 1 (**Default 0)**

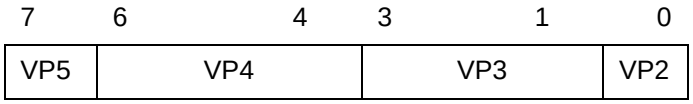
Bit [7:6]: Priority when the VLAN tag priority field is 2 **(Default 0)**

13.7.5 AVPMM – VLAN Priority Map

I²C Address h0AE, CPU Address:h504

Accessed by serial interface and I²C (R/W)

Map VLAN priority into eight level transmit priorities:



Bit [0]: Priority when the VLAN tag priority field is 2 **(Default 0)**

Bit [3:1]: Priority when the VLAN tag priority field is 3 **(Default 0)**

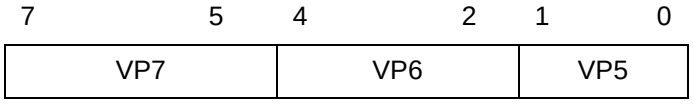
Bit [6:4]: Priority when the VLAN tag priority field is 4 **(Default 0)**

Bit [7]: Priority when the VLAN tag priority field is 5 **(Default 0)**

13.7.6 AVPMH – VLAN Priority Map

I²C Address h0AF, CPU Address:h505

Accessed by serial interface and I²C (R/W)



Map VLAN priority into eight level transmit priorities:

Bit [1:0]: Priority when the VLAN tag priority field is 5 **(Default 0)**

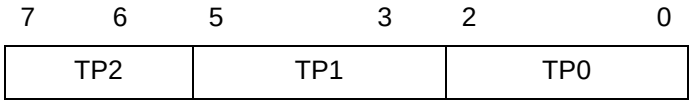
Bit [4:2]: Priority when the VLAN tag priority field is 6 **(Default 0)**

Bit [7:5]: Priority when the VLAN tag priority field is 7 **(Default 0)**

13.7.7 TOSPML – TOS Priority Map

I²C Address h0B0, CPU Address:h506

Accessed by serial interface and I²C (R/W)



Map TOS field in IP packet into eight level transmit priorities

Bit [2:0]: Priority when the TOS field is 0 **(Default 0)**

Bit [5:3]: Priority when the TOS field is 1 **(Default 0)**

Bit [7:6]: Priority when the TOS field is 2 **(Default 0)**

13.7.8 TOSPMM – TOS Priority Map

I²C Address h0B1, CPU Address:h507

Accessed by serial interface and I²C (R/W)

7	6 4	3 1	0
TP5	TP4	TP3	TP2

Map TOS field in IP packet into eight level transmit priorities

Bit [0]: Priority when the TOS field is 2 **(Default 0)**

Bit [3:1]: Priority when the TOS field is 3 **(Default 0)**

Bit [6:4]: Priority when the TOS field is 4 **(Default 0)**

Bit [7]: Priority when the TOS field is 5 **(Default 0)**

13.7.9 TOSPMH – TOS Priority Map

I²C Address h0B2, CPU Address:h508

Accessed by serial interface and I²C (R/W)

7 5	4 2	0
TP7	TP6	TP5

Map TOS field in IP packet into eight level transmit priorities:

Bit [1:0]: Priority when the TOS field is 5 **(Default 0)**

Bit [4:2]: Priority when the TOS field is 6 **(Default 0)**

Bit [7:5]: Priority when the TOS field is 7 **(Default 0)**

13.7.10 AVDM – VLAN Discard Map

I²C Address h0B3, CPU Address:h509

Accessed by serial interface and I²C (R/W)

7	6	5	4	3	2	1	0
FDV7	FDV6	FDV5	FDV4	FDV3	FDV2	FDV1	FDV0

Map VLAN priority into frame discard when low priority buffer usage is above threshold

Bit [0]: Frame drop priority when VLAN Tag priority field is 0 **(Default 0)**

Bit [1]: Frame drop priority when VLAN Tag priority field is 1 **(Default 0)**

Bit [2]: Frame drop priority when VLAN Tag priority field is 2 **(Default 0)**

Bit [3]: Frame drop priority when VLAN Tag priority field is 3 **(Default 0)**

Bit [4]: Frame drop priority when VLAN Tag priority field is 4 **(Default 0)**

Bit [5]: Frame drop priority when VLAN Tag priority field is 5 **(Default 0)**

Bit [6]: Frame drop priority when VLAN Tag priority field is 6 **(Default 0)**

Bit [7]: Frame drop priority when VLAN Tag priority field is 7 **(Default 0)**

13.7.11 TOSDML – TOS Discard Map

I²C Address h0B4, CPU Address:h50A

Accessed by serial interface and I²C (R/W)

7	6	5	4	3	2	1	0
FDT7	FDT6	FDT5	FDT4	FDT3	FDT2	FDT1	FDT0

Map TOS into frame discard when low priority buffer usage is above threshold

Bit [0]: Frame drop priority when TOS field is 0 **(Default 0)**

Bit [1]: Frame drop priority when TOS field is 1 **(Default 0)**

Bit [2]: Frame drop priority when TOS field is 2 **(Default 0)**

Bit [3]: Frame drop priority when TOS field is 3 **(Default 0)**

Bit [4]: Frame drop priority when TOS field is 4 **(Default 0)**

Bit [5]: Frame drop priority when TOS field is 5 **(Default 0)**

Bit [6]: Frame drop priority when TOS field is 6 **(Default 0)**

Bit [7]: Frame drop priority when TOS field is 7 **(Default 0)**

13.7.12 BMRC - Broadcast/Multicast Rate Control

I²C Address h0B5, CPU Address:h50B)

Accessed by serial interface and I²C (R/W)

7 4	3 0
Broadcast Rate	Multicast Rate

This broadcast and multicast rate defines for each port, the number of packets allowed to be forwarded within a specified time. Once the packet rate is reached, packets will be dropped. To turn off the rate limit, program the field to 0. Time base is based on register FCR [6:4]

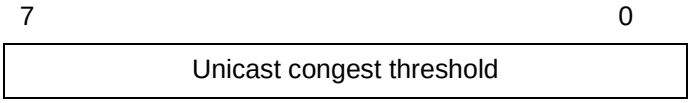
Bit [3:0]: Multicast Rate Control. Number of multicast packets allowed within the time defined in bits 6 to 4 of the Flooding Control Register (FCR). **(Default 0)**.

Bit [7:4]: Broadcast Rate Control. Number of broadcast packets allowed within the time defined in bits 6 to 4 of the Flooding Control Register (FCR). **(Default 0)**

13.7.13 UCC – Unicast Congestion Control

I²C Address h0B6, CPU Address: 50C

Accessed by serial interface and I²C (R/W)

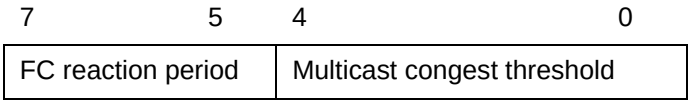


Bit [7:0]: Number of frame count. Used for best effort dropping at B% when destination port's best effort queue reaches UCC threshold and shared pool is all in use. Granularity 1 frame. (Default: h10 for 2 MB/bank or h08 for 1 MB/bank)

13.7.14 MCC – Multicast Congestion Control

I²C Address h0B7, CPU Address: 50D

Accessed by serial interface and I²C (R/W)



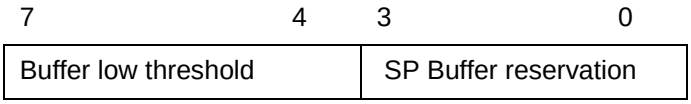
Bit [4:0]: In multiples of two frames (granularity). Used for triggering MC flow control when destination port's multicast best effort queue reaches MCC threshold.(Default 0x10)

Bit [7:5]: Flow control reaction period (Default 2) Granularity 4uSec.

13.7.15 PR100 – Port Reservation for 10/100 ports

I²C Address h0B8, CPU Address 50E

Accessed by serial interface and I²C (R/W)



Bit [3:0]: Per source port buffer reservation.
Define the space in the FDB reserved for each 10/100 port and CPU. Expressed in multiples of 4 packets. For each packet 1536 bytes are reserved in the memory.

Bits [7:4]: Expressed in multiples of 4 packets. Threshold for dropping all best effort frames when destination port best efforts queues reaches UCC threshold, shared pool is all used and source port reservation is at or below the PR100[7:4] level. Also the threshold for initiating UC flow control.

- Default:
  - h36 for 16+2 configuration with memory 2MB/bank;
  - h24 for 16+2 configuration with 1MB/bank;

13.7.16 PRG – Port Reservation for Giga ports

I²C Address h0B9, CPU Address 50F

Accessed by serial interface and I²C (R/W)

7 4	3 0
Buffer low threshold	SP buffer reservation

Bit [3:0]: Per source port buffer reservation.
Define the space in the FDB reserved for each Gigabit port. Expressed in multiples of 16 packets. For each packet 1536 bytes are reserved in the memory.

Bits [7:4]: Expressed in multiples of 16 packets. Threshold for dropping all best effort frames when destination port best effort queues reach UCC threshold, shared pool is all used and source port reservation is at or below the PRG[7:4] level. Also the threshold for initiating UC flow control.

- Default:
  - H58 for memory 2MB/bank;
  - H35 for 1MB/bank;

13.7.17 SFCB – Share FCB Size

I²C Address h0BA), CPU Address 510

Accessed by serial interface and I²C (R/W)

7 0
Shared pool buffer size

Bits [7:0]: Expressed in multiples of 4 packets. Buffer reservation for shared pool.

- Default:
  - h64 for 16+2 configuration with memory of 2MB/bank;
  - h14 for 16+2 configuration with memory of 1MB/bank;

13.7.18 C2RS – Class 2 Reserve Size

I²C Address h0BB, CPU Address 511

Accessed by serial interface and I²C (R/W)

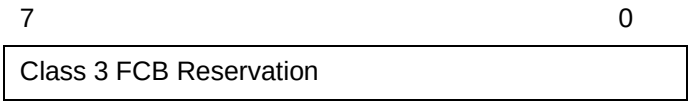
7 0
Class 2 FCB Reservation

Buffer reservation for class 2 (third lowest priority). Granularity 1. **(Default 0)**

13.7.19 C3RS – Class 3 Reserve Size

I²C Address h0BC, CPU Address 512

Accessed by serial interface and I²C (R/W)

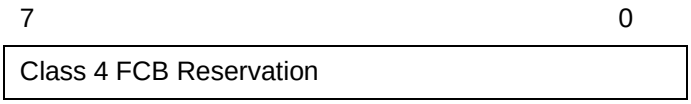


Buffer reservation for class 3. Granularity 1. **(Default 0)**

13.7.20 C4RS – Class 4 Reserve Size

I²C Address h0BD, CPU Address 513

Accessed by serial interface and I²C (R/W)

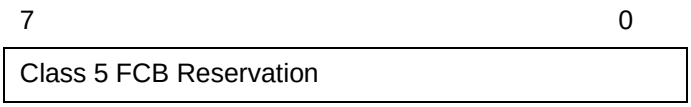


Buffer reservation for class 4. Granularity 1. **(Default 0)**

13.7.21 C5RS – Class 5 Reserve Size

I²C Address h0BE; CPU Address 514

Accessed by serial interface and I²C (R/W)

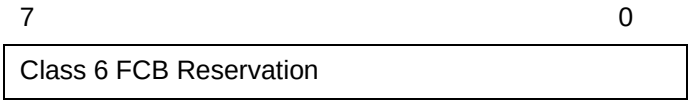


Buffer reservation for class 5. Granularity 1. **(Default 0)**

13.7.22 C6RS – Class 6 Reserve Size

I²C Address h0BF; CPU Address 515

Accessed by serial interface and I²C (R/W)

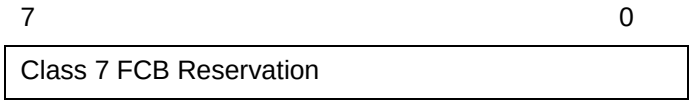


Buffer reservation for class 6 (second highest priority). Granularity 1. **(Default 0)**

13.7.23 C7RS – Class 7 Reserve Size

I²C Address h0C0; CPU Address 516

Accessed by serial interface and I²C (R/W)



Buffer reservation for class 7 (highest priority). Granularity 1. **(Default 0)**

13.7.24 QOSCn - Classes Byte Limit Set 0

Accessed by serial interface and I²C (R/W):

C — QOSC00 – BYTE_C01 (I²C Address h0C1, CPU Address 517)

B — QOSC01 – BYTE_C02 (I²C Address h0C2, CPU Address 518)

A — QOSC02 – BYTE_C03 (I²C Address h0C3, CPU Address 519)

QOSC00 through QOSC02 represents one set of values A-C for a 10/100 port when using the Weighted Random Early Drop (WRED) Scheme described in Chapter 7. There are four such sets of values A-C specified in Classes Byte Limit Set 0, 1, 2, and 3.

Each 10/ 100 port can choose one of the four Byte Limit Sets as specified by the QoS Select field located in bits 5 to 4 of the ECR2n register. The values A-C are per-queue byte thresholds for random early drop. QOSC02 represents A, and QOSC00 represents C.

Granularity when Delay bound is used: QOSC02: 128 bytes, QOSC01: 256 bytes, QOSC00: 512 bytes. Granularity when WFQ is used: QOSC02: 512 bytes, QOSC01: 512 bytes, QOSC00: 512 bytes.

13.7.25 Classes Byte Limit Set 1

Accessed by serial interface and I²C (R/W):

C - QOSC03 – BYTE_C11 (I²C Address h0C4, CPU Address 51a)

B - QOSC04 – BYTE_C12 (I²C Address h0C5, CPU Address 51b)

A - QOSC05 – BYTE_C13 (I²C Address h0C6, CPU Address 51c)

QOSC03 through QOSC05 represents one set of values A-C for a 10/100 port when using the Weighted Random Early Detect (WRED) Scheme.

Granularity when Delay bound is used: QOSC05: 128 bytes, QOSC04: 256 bytes. QOSC03: 512 bytes. Granularity when WFQ is used: QOSC05: 512 bytes, QOSC04: 512 bytes, QOSC03: 512 bytes.

13.7.26 Classes Byte Limit Set 2

Accessed by serial interface (R/W):

C - QOSC06 – BYTE_C21 (CPU Address 51d)

B - QOSC07 – BYTE_C22 (CPU Address 51e)

A - QOSC08 – BYTE_C23 (CPU Address 51f)

QOSC06 through QOSC08 represents one set of values A-C for a 10/100 port when using the Weighted Random Early Detect (WRED) Scheme.

Granularity when Delay bound is used: QOSC08: 128 bytes, QOSC07: 256 bytes. QOSC06: 512 bytes. Granularity when WFQ is used: QOSC08: 512 bytes, QOSC07: 512 bytes, QOSC06: 512 bytes.

13.7.27 Classes Byte Limit Set 3

Accessed by serial interface (R/W):

C - QOSC09 – BYTE_C31 (CPU Address 520)

B - QOSC10 – BYTE_C32 (CPU Address 521)

A - QOSC11 – BYTE_C33 (CPU Address 522)

QOSC09 through QOSC011 represents one set of values A-C for a 10/100 port when using the Weighted Random Early Drop (WRED) scheme.

Granularity when Delay bound is used: QOSC11: 128 bytes, QOSC10: 256 bytes, QOSC09: 512 bytes.

Granularity when WFQ is used: QOSC11: 512 bytes, QOSC10: 512 bytes, QOSC09: 512 bytes

13.7.28 Classes Byte Limit Giga Port 1

Accessed by serial interface and I²C (R/W):

F - QOSC12 – BYTE_C2_G1 (I²C Address h0C7, CPU Address 523)

E - QOSC13 – BYTE_C3_G1 (I²C Address h0C8, CPU Address 524)

D - QOSC14 – BYTE_C4_G1 (I²C Address h0C9, CPU Address 525)

C -QOSC15 – BYTE_C5_G1 (I²C Address h0CA, CPU Address 526)

B - QOSC16 – BYTE_C6_G1 (I²C Address h0CB, CPU Address 527)

A - QOSC17 – BYTE_C7_G1 (I²C Address h0CC, CPU Address 528)

QOSC12 through QOSC17 represent the values A-F for Gigabit port 1. They are per-queue byte thresholds for random early drop. QOSC17 represents A, and QOSC12 represents F.

Granularity when Delay bound is used: QOSC17 and QOSC16: 256 bytes, QOSC15 and QOSC14: 512 bytes, QOSC13 and QOSC12: 1024 bytes.

Granularity when WFQ is used: QOSC17 to QOSC12: 1024 bytes

13.7.29 Classes Byte Limit Giga Port 2

Accessed by serial interface and I²C (R/W)

F - QOSC18 – BYTE_C2_G2 (I²C Address h0CD, CPU Address 529)

E - QOSC19 – BYTE_C3_G2 (I²C Address h0CE, CPU Address 52a)

D - QOSC20 – BYTE_C4_G2 (I²C Address h0CF, CPU Address 52b)

C - QOSC21 – BYTE_C5_G2 (I²C Address h0D0, CPU Address 52c)

B - QOSC22 – BYTE_C6_G2 (I²C Address h0D1, CPU Address 52d)

A - QOSC23 – BYTE_C7_G2 (I²C Address h0D2, CPU Address 52e)

QOSC12 through QOSC17 represent the values A-F for Gigabit port 2. They are per-queue byte thresholds for random early drop. QOSC17 represents A, and QOSC12 represents F.

Granularity when Delay bound is used: QOSC17 and QOSC16: 256 bytes, QOSC15 and QOSC14: 512 bytes, QOSC13 and QOSC12: 1024 bytes.

Granularity when WFQ is used: QOSC17 to QOSC12: 1024 bytes

13.7.30 Classes WFQ Credit Set 0

Accessed by serial interface

W3 - QOSC24[5:0] – CREDIT_C00 (CPU Address 52f)

W2 - QOSC25[5:0] – CREDIT_C01 (CPU Address 530)

W1 - QOSC26[5:0] – CREDIT_C02 (CPU Address 531)

W0 - QOSC27[5:0] – CREDIT_C03 (CPU Address 532)

QOSC24 through QOSC27 represents one set of WFQ parameters for a 10/100 port. There are four such sets of values. The granularity of the numbers is 1, and their sum must be 64. QOSC27 corresponds to W0, and QOSC24 corresponds to W3.

QOSC24[7:6]: Priority service type for the ports select this parameter set. Option 1 to option 4.

QOSC25[7]: Priority service allow flow control for the ports select this parameter set.

QOSC25[6]: Flow control pause best effort traffic only

Both flow control allow and flow control best effort only can take effect only the priority type is WFQ.

13.7.31 Classes WFQ Credit Set 1

Accessed by serial interface

W3 - QOSC28[5:0] – CREDIT_C10 (CPU Address 533)

W2 - QOSC29[5:0] – CREDIT_C11 (CPU Address 534)

W1 - QOSC30[5:0] – CREDIT_C12 (CPU Address 535)

W0 - QOSC31[5:0] – CREDIT_C13 (CPU Address 536)

QOSC28 through QOSC31 represents one set of WFQ parameters for a 10/100 port. There are four such sets of values. The granularity of the numbers is 1, and their sum must be 64. QOSC31 corresponds to W0, and QOSC28 corresponds to W3.

QOSC28[7:6]: Priority service type for the ports select this parameter set. Option 1 to option 4.

QOSC29[7]: Priority service allow flow control for the ports select this parameter set.

QOSC29[6]: Flow control pause best effort traffic only

13.7.32 Classes WFQ Credit Set 2

Accessed by serial interface

W3 - QOSC32[5:0] – CREDIT_C20 (CPU Address 537)

W2 - QOSC33[5:0] – CREDIT_C21 (CPU Address 538)

W1 - QOSC34[5:0] – CREDIT_C22 (CPU Address 539)

W0 - QOSC35[5:0] – CREDIT_C23 (CPU Address 53a)

QOSC35 through QOSC32 represents one set of WFQ parameters for a 10/100 port. There are four such sets of values. The granularity of the numbers is 1, and their sum must be 64. QOSC35 corresponds to W0, and QOSC32 corresponds to W3.

QOSC32[7:6]: Priority service type for the ports select this parameter set. Option 1 to option 4.

QOSC33[7]: Priority service allow flow control for the ports select this parameter set.

QOSC33[6]: Flow control pause for best effort traffic only

13.7.33 Classes WFQ Credit Set 3

Accessed by serial interface

W3 - QOSC36[5:0] – CREDIT_C30 (CPU Address 53b)

W2 - QOSC37[5:0] – CREDIT_C31 (CPU Address 53c)

W1 - QOSC38[5:0] – CREDIT_C32 (CPU Address 53d)

W0 - QOSC39[5:0] – CREDIT_C33 (CPU Address 53e)

QOSC39 through QOSC36 represents one set of WFQ parameters for a 10/100 port. There are four such sets of values. The granularity of the numbers is 1, and their sum must be 64. QOSC39 corresponds to W0, and QOSC36 corresponds to W3.

QOSC36[7:6]: Priority service type for the ports select this parameter set. Option 1 to option 4.

QOSC37[7]: Priority service allow flow control for the ports select this parameter set.

QOSC37[6]: Flow control pause best effort traffic only

13.7.34 Classes WFQ Credit Port G1

Accessed by serial interface

W7 - QOSC40[5:0] - CREDIT_C0_G1(CPU Address 53f)

[7:6]: Priority service type. Option 1 to 4.

W6 - QOSC41[5:0] – CREDIT_C1_G1 (CPU Address 540)

[7]: Priority service allow flow control for the ports select this parameter set.

[6]: Flow control pause best effort traffic only

W5 - QOSC42[5:0] – CREDIT_C2_G1 (CPU Address 541)

W4 - QOSC43[5:0] – CREDIT_C3_G1 (CPU Address 542)

W3 - QOSC44[5:0] – CREDIT_C4_G1 (CPU Address 543)

W2 - QOSC45[5:0] – CREDIT_C5_G1 (CPU Address 544)

W1 - QOSC46[5:0] – CREDIT_C6_G1 (CPU Address 545)

W0 - QOSC47[5:0] – CREDIT_C7_G1 (CPU Address 546)

QOSC40 through QOSC47 represents the set of WFQ parameters for Gigabit port 24. The granularity of the numbers is 1, and their sum must be 64. QOSC47 corresponds to W0, and QOSC40 corresponds to W7.

13.7.35 Classes WFQ Credit Port G2

Accessed by serial interface

W7 - QOSC48[5:0] – CREDIT_C0_G2(CPU Address 547)

[7:6]: Priority service type. Option 1 to 4

W6 - QOSC49[5:0] – CREDIT_C1_G2(CPU Address 548)

[7]: Priority service allow flow control for the ports select this parameter set.

[6]: Flow control pause best effort traffic only

W5 - QOSC50[5:0] – CREDIT_C2_G2(CPU Address 549)

W4 - QOSC51[5:0] – CREDIT_C3_G2(CPU Address 54a)

W3 - QOSC52[5:0] – CREDIT_C4_G2(CPU Address 54b)

W2 - QOSC53[5:0] – CREDIT_C5_G2(CPU Address 54c)

W1 - QOSC54[5:0] – CREDIT_C6_G2(CPU Address 54d)

W0 - QOSC55[5:0] – CREDIT_C7_G2(CPU Address 54e)

QOSC48 through QOSC55 represents the set of WFQ parameters for Gigabit port 2. The granularity of the numbers is 1, and their sum must be 64. QOSC55 corresponds to W0, and QOSC48 corresponds to W7.

13.7.36 Class 6 Shaper Control Port G1

Accessed by serial interface

QOSC56[5:0] – TOKEN_RATE_G1 (CPU Address 54f). Programs de average rate for gigabit port 1. When equal to 0, shaper is disable. Granularity is 1.

QOSC57[7:0] – TOKEN_LIMIT_G1 (CPU Address 550). Programs the maximum counter for gigabit port 1. Granularity is 16 bytes.

Shaper is implemented to control the peak and average rate for outgoing traffic with priority 6 (queue 6). Shaper is limited to gigabit ports and queue P6 when it is in strict priority. QOSC41 programs the peak rate for gigabit port 1. See Programming QoS Registers application note for more information

13.7.37 Class 6 Shaper Control Port G2

Accessed by serial interface

QOSC58[5:0] – TOKEN_RATE_G2 (CPU Address 551). Programs de average rate for gigabit port 2. When equal to 0, shaper is disable. Granularity is 1.

QOSC59[7:0] – TOKEN_LIMIT_G2 (CPU Address 552). Programs the maximum counter for gigabit port 2. Granularity is 16 bytes.

Shaper is implemented to control the peak and average rate for outgoing traffic with priority 6 (queue 6). Shaper is limited to gigabit ports and queue P6 when it is in strict priority. QOSC49 programs the peak rate for gigabit port 2. See Programming QoS Register application note for more information.

13.7.38 RDRC0 – WRED Rate Control 0

I²C Address 0FB, CPU Address 553

Accessed by Serial Interface and I²C (R/W)

7 4	3 0
X Rate	Y Rate

Bits [7:4]: Corresponds to the frame drop percentage X% for WRED. Granularity 6.25%.

Bits[3:0]: Corresponds to the frame drop percentage Y% for WRED. Granularity 6.25%.

See Programming QoS Registers application note for more information

13.7.39 RDRC1 – WRED Rate Control 1

I²C Address 0FC, CPU Address 554

Accessed by Serial Interface and I²C (R/W)

7 4	3 0
Z Rate	B Rate

Bits [7:4]: Corresponds to the frame drop percentage Z% for WRED. Granularity 6.25%.

Bits[3:0]: Corresponds to the best effort frame drop percentage B%, when shared pool is all in use and destination port best effort queue reaches UCC. Granularity 6.25%.

See Programming QoS Registers application note for more information

13.7.40 User Defined Logical Ports and Well Known Ports

The ZL50417 supports classifying packet priority through layer 4 logical port information. It can be setup by 8 Well Known Ports, 8 User Defined Logical Ports, and 1 User Defined Range. The 8 Well Known Ports supported are:

- 0:23
- 1:512
- 2:6000
- 3:443
- 4:111
- 5:22555
- 6:22
- 7:554

Their respective priority can be programmed via Well_Known_Port [7:0] priority register. Well_Known_Port_ Enable can individually turn on/off each Well Known Port if desired.

Similarly, the User Defined Logical Port provides the user programmability to the priority, plus the flexibility to select specific logical ports to fit the applications. The 8 User Logical Ports can be programmed via User_Port 0-7

registers. Two registers are required to be programmed for the logical port number. The respective priority can be programmed to the User_Port [7:0] priority register. The port priority can be individually enabled/disabled via User_Port_Enable register.

The User Defined Range provides a range of logical port numbers with the same priority level. Programming is similar to the User Defined Logical Port. Instead of programming a fixed port number, an upper and lower limit need to be programmed, they are: {RHIGHH, RHIGHL} and {RLOWH, RLOWL} respectively. If the value in the upper limit is smaller or equal to the lower limit, the function is disabled. Any IP packet with a logical port that is less than the upper limit and more than the lower limit will use the priority specified in RPRIORITY.

13.7.40.1 USER_PORT0_(0~7) – User Define Logical Port (0~7)

USER_PORT_0 - I²C Address h0D6 + 0DE; CPU Address 580(Low) + 581(high)

USER_PORT_1 - I²C Address h0D7 + 0DF; CPU Address 582 + 583

USER_PORT_2 - I²C Address h0D8 + 0E0; CPU Address 584 + 585

USER_PORT_3 - I²C Address h0D9 + 0E1; CPU Address 586 + 587

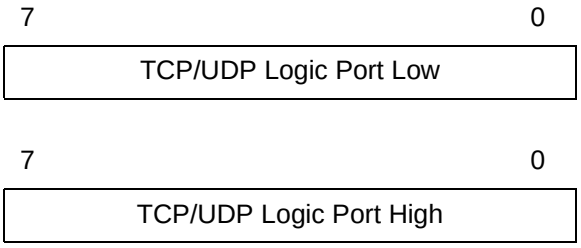
USER_PORT_4 - I²C Address h0DA + 0E2; CPU Address 588 + 589

USER_PORT_5 - I²C Address h0DB + 0E3; CPU Address 58A + 58B

USER_PORT_6 - I²C Address h0DC + 0E4; CPU Address 58C + 58D

USER_PORT_7 - I²C Address h0DD + 0E5; CPU Address 58E + 58F

Accessed by CPU, serial interface and I²C (R/W)

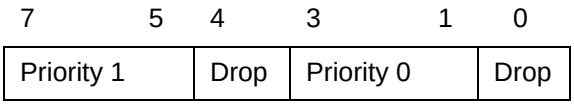


(Default 00) This register is duplicated eight times from PORT 0 through PORT 7 and allows the CPU to define eight separate ports.

13.7.40.2 USER_PORT_[1:0]_PRIORITY - User Define Logic Port 1 and 0 Priority

I²C Address h0E6, CPU Address 590

Accessed by serial interface and I²C (R/W)



The chip allows the CPU to define the priority

Bits[3:0]: Priority setting, transmission + dropping, for logic port 0

Bits [7:4]: Priority setting, transmission + dropping, for logic port 1 (Default 00)

13.7.40.3 USER_PORT_[3:2]_PRIORITY - User Define Logic Port 3 and 2 Priority

I²C Address h0E7, CPU Address 591

Accessed by serial interface and I²C (R/W)

7 5	4	3 1	0
Priority 3	Drop	Priority 2	Drop

13.7.40.4 USER_PORT_[5:4]_PRIORITY - User Define Logic Port 5 and 4 Priority

I²C Address h0E8, CPU Address 592

Accessed by serial interface and I²C (R/W)

7 5	4	3 1	0
Priority 5	Drop	Priority 4	Drop

(Default 00)

13.7.40.5 USER_PORT_[7:6]_PRIORITY - User Define Logic Port 7 and 6 Priority

I²C Address h0E9, CPU Address 593

Accessed by serial interface and I²C (R/W)

7 5	4	3 1	0
Priority 7	Drop	Priority 6	Drop

(Default 00)

13.7.40.6 USER_PORT_ENABLE[7:0] – User Define Logic 7 to 0 Port Enables

I²C Address h0EA, CPU Address 594

Accessed by serial interface and I²C (R/W)

7	6	5	4	3	2	1	0
P7	P6	P5	P4	P3	P2	P1	P0

(Default 00)

13.7.40.7 WELL_KNOWN_PORT[1:0] PRIORITY- Well Known Logic Port 1 and 0 Priority

I²C Address h0EB, CPU Address 595

Accessed by serial interface and I²C (R/W)

7 5	4	3 1	0
Priority 1	Drop	Priority 0	Drop

Priority 0 - Well known port 23 for telnet applications.

Priority 1 - Well Known port 512 for TCP/UDP.

(Default 00)

13.7.40.8 WELL_KNOWN_PORT[3:2] PRIORITY- Well Known Logic Port 3 and 2 Priority

I²C Address h0EC, CPU Address 596

Accessed by serial interface and I²C (R/W)

7 5	4	3 1	0
Priority 3	Drop	Priority 2	Drop

Priority 2 - Well known port 6000 for XWIN.

Priority 3 - Well known port 443 for http.sec

(Default 00)

13.7.40.9 WELL_KNOWN_PORT [5:4] PRIORITY- Well Known Logic Port 5 and 4 Priority

I²C Address h0ED, CPU Address 597

Accessed by serial interface and I²C (R/W)

7 5	4	3 1	0
Priority 5	Drop	Priority 4	Drop

Priority 4 - Well Known port 111 for sun remote procedure call.

Priority 5 - Well Known port 22555 for IP Phone call setup.

(Default 00)

13.7.40.10 WELL_KNOWN_PORT [7:6] PRIORITY- Well Known Logic Port 7 and 6 Priority

I²C Address h0EE, CPU Address 598

Accessed by serial interface and I²C (R/W)

7 5	4	3 1	0
Priority 7	Drop	Priority 6	Drop

Priority 6 - well know port 22 for ssh.

Priority 7 – well Known port 554 for rtsp.
(Default 00)

13.7.40.11 WELL KNOWN_PORT_ENABLE [7:0] – Well Known Logic 7 to 0 Port Enables

I²C Address h0EF, CPU Address 599

Accessed by serial interface and I²C (R/W)

7	6	5	4	3	2	1	0
P7	P6	P5	P4	P3	P2	P1	P0

- 1 – Enable
- 0 - Disable

(Default 00)

13.7.40.12 RLOWL – User Define Range Low Bit 7:0

I²C Address h0F4, CPU Address: 59a

Accessed by serial interface and I²C (R/W)

(Default 00)

13.7.40.13 1RLOWH – User Define Range Low Bit 15:8

I²C Address h0F5, CPU Address: 59b

Accessed by serial interface and I²C (R/W)

(Default 00)

13.7.40.14 RHIGHL – User Define Range High Bit 7:0

I²C Address h0D3, CPU Address: 59c

Accessed by CPU, serial interface and I²C (R/W)

(Default 00)

13.7.40.15 RHIGHH – User Define Range High Bit 15:8

I²C Address h0D4, CPU Address: 59d

Accessed by serial interface and I²C (R/W)

(Default 00)

13.7.40.16 RPRIORITY – User Define Range Priority

I²C Address h0D5, CPU Address: 59e

Accessed by serial interface and I²C (R/W)

7 4	3	0
	Range Transmit Priority	Drop

RLOW and RHIGH form a range for logical ports to be classified with priority specified in RPRIORITY.

Bit[3:1] Transmit Priority

Bits[0]: Drop Priority

13.8 (Group 6 Address) MISC Group

13.8.1 MII_OP0 – MII Register Option 0

I²C Address F0, CPU Address:h600

Accessed by serial interface and I²C (R/W)

7	6	5	4 ... 0
hfc	1prst	DisJ	Vendor Spc. Reg Addr

Bits [7]: Half duplex flow control feature
0 = Half duplex flow control always enable
1 = Half duplex flow control by negotiation

Bits[6]: Link partner reset auto-negotiate disable

Bits[5]: Disable jabber detection. This is for HomePNA applications or any serial operation slower than 10Mbps.
0 = Enable
1 = Disable

Bit[4:0]: Vendor specified link status register address (null value means don't use it) (Default 00). This is used if the Linkup bit position in the PHY is non-standard

13.8.2 MII_OP1 – MII Register Option 1

I²C Address F1, CPU Address:h601

Accessed by serial interface and I²C (R/W)

7 ... 4	3 ... 0
Speed bit location	Duplex bit location

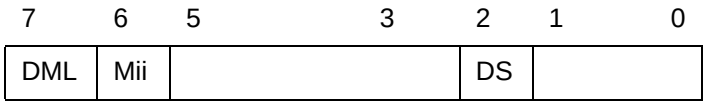
Bits[3:0]: Duplex bit location in vendor specified register

Bits [7:4]: Speed bit location in vendor specified register
(Default 00)

13.8.3 FEN – Feature Register

I²C Address F2, CPU Address:h602)

Accessed by serial interface and I²C (R/W)



Bits [1:0]: Reserved **(Default 0)**

Bit [2]: Support DS EF Code. **(Default 0)**
- 0 – Disable
- 1 – Enable (all ports)

When 101110 is detected in DS field (TOS[7:2]), the frame priority is set for 110 and drop is set for 0.

Bit [5:3]: Reserved **(Default 010)**

Bit [6]: Disable MII Management State Machine **(Default 0)**
- 0: Enable MII Management State Machine
- 1: Disable MII Management State Machine

Bit [7]: Disable using MCT Link List structure **(Default 0)**
- 0 – Enable using MCT Link structure
- 1 - Disable using MCT Link List structure

13.8.4 MIIC0 – MII Command Register 0

CPU Address:h603

Accessed by serial interface only (R/W)

Bit [7:0] - MII Data [7:0]

Note: Before programming MII command: set FEN[6], check MIIC3, making sure no RDY, and no VALID; then program MII command.

13.8.5 MIIC1 – MII Command Register 1

CPU Address:h604

Accessed by serial interface only (R/W)

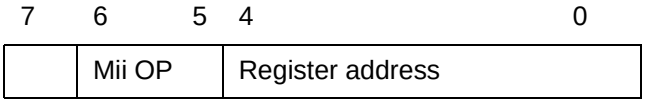
Bit [7:0] - MII Data [15:8]

Note: Before programming MII command: set FEN[6], check MIIC3, making sure no RDY and no VALID; then program MII command.

13.8.6 MIIC2 – MII Command Register 2

CPU Address:h605

Accessed by serial interface only (R/W)



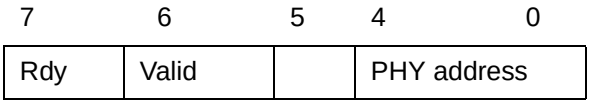
- Bit [4:0] REG_AD – Register PHY Address
- Bit [6:5] OP – Operation code “10” for read command and “01” for write command

Note: Before programming MII command: set FEN[6], check MIIC3, making sure no RDY and no VALID; then program MII command.

13.8.7 MIIC3 – MII Command Register 3

CPU Address:h606

Accessed by serial interface only (R/W)



- Bits [4:0] PHY_AD – 5 Bit PHY Address
- Bit [6] VALID – Data Valid from PHY (Read Only)
- Bit [7] RDY – Data is returned from PHY (Ready Only)

Note: Before programming MII command: set FEN[6], check MIIC3, making sure no RDY and no VALID; then program MII command. Writing this register will initiate a serial management cycle to the MII management interface.

13.8.8 MIID0 – MII Data Register 0

CPU Address:h607

Accessed by serial interface only (RO)

Bit [7:0] - MII Data [7:0]

13.8.9 MIID1 – MII Data Register 1

CPU Address:h608

Accessed by serial interface only (RO)

Bit [7:0] - MII Data [15:8]

13.8.10 LED Mode – LED Control

CPU Address:h609

Accessed by CPU, serial interface and I²C (R/W)

7 5	4 3	2 1	0
	Clock rate	Hold Time	

- Bit [0] Reserved (Default 0)
- Bit[2:1]: Hold time for LED signal **(Default 00)**
  00=8msec 01=16msec
  10=32msec 11=64msec
- Bit[4:3]: LED clock frequency **(Default 0)**
  00=100M/8=12.5 MHz
  01=100M/16= 25 MHz
  10=100M/32= 125 MHz
  11=100M/64=1.5625 MHz
- Bit[7:5]: Reserved. Must be set to '0' **(Default 0)**

13.8.11 CHECKSUM - EEPROM Checksum

I²C Address FF, CPU Address:h60b

Accessed by serial interface and I²C (R/W)

- Bit [7:0]: (Default 0)

This register is used in unmanaged mode only. Before requesting that the ZL50417 updates the EEPROM device, the correct checksum needs to be calculated and written into this checksum register. The checksum formula is:

$$\sum_{i=0}^{FF} I^2C \text{ register} = 0$$

When the ZL50417 boots from the EEPROM the checksum is calculated and the value must be zero. If the checksum is not zeroed the ZL50417 does not start and pin CHECKSUM_OK is set to zero.

13.9 (Group 7 Address) Port Mirroring Group

13.9.1 MIRROR1_SRC – Port Mirror source port

CPU Address 700

Accessed by serial interface (R/W) (Default 7F)

7	6	5	4 ... 0
		I/O	Src Port Select

- Bit [4:0]: Source port to be mirrored. Use illegal port number to disable mirroring
- Bit [5]: 1 – select ingress data
0 – select egress data
- Bit [6]: Reserved
- Bit [7]: Reserved must be se to '1'

13.9.2 MIRROR1_DEST – Port Mirror destination

CPU Address 701

Accessed by serial interface (R/W) (Default 17)

7 ... 5	4 ... 0
	Dest Port Select

- Bit [4:0]: Port Mirror Destination
When port mirroring is enable, destination port can not serve as a data port.

13.9.3 MIRROR2_SRC – Port Mirror source port

CPU Address 702

Accessed by serial interface (R/W) (Default FF)

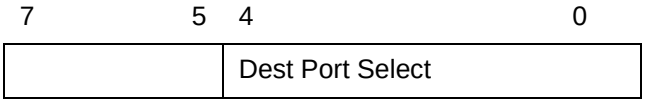
7	6	5	4 ... 0
		I/O	Src Port Select

- Bit [4:0]: Source port to be mirrored. Use illegal port number to disable mirroring
- Bit [5]: 1 – select ingress data
0 – select egress data
- Bit [6] Reserved
- Bit [7] Reserved must be set to '1'

13.9.4 MIRROR2_DEST – Port Mirror destination

CPU Address 703

Accessed by serial interface (R/W) (Default 00)



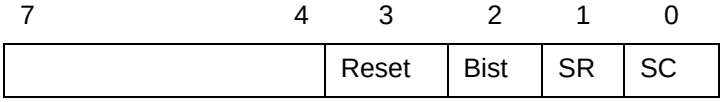
Bit [4:0]: Port Mirror Destination
When port mirroring is enable, destination port can not serve as a data port.

13.10 (Group F Address) CPU Access Group

13.10.1 GCR-Global Control Register

CPU Address: hF00

Accessed by serial interface. (R/W)



Bit [0]: Store configuration **(Default = 0)**
Write ‘1’ followed by ‘0’ to store configuration into external EEPROM

Bit[1]: Store configuration and reset **(Default = 0)**
Write ‘1’ to store configuration into external EEPROM and reset chip

Bit[2]: Start BIST (Default = 0)
Write ‘1’ followed by ‘0’ to start the device’s built-in self-test. The result is found in the DCR register.

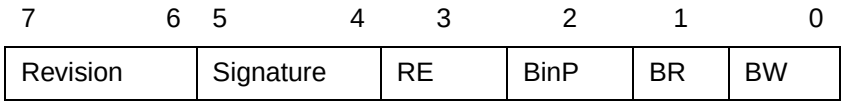
Bit[3]: Soft Reset (Default = 0)
Write ‘1’ to reset chip

Bit[7:4]: Reserved

13.10.2 DCR-Device Status and Signature Register

CPU Address: hF01

Accessed by serial interface. (RO)



Bit [0]: 1: Busy writing configuration to I²C
0: Not busy (not writing configuration to I²C)

Bit[1]: 1: Busy reading configuration from I²C
0: Not busy (not reading configuration from I²C)

Bit[2]: 1: BIST in progress
0: BIST not running

Bit[3]: 1: RAM Error
0: RAM OK

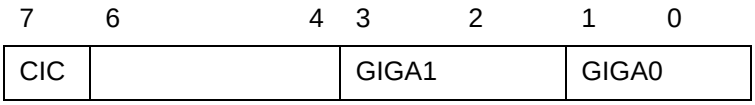
Bit[5:4]: Device Signature
11: ZL50417 device

Bit [7:6]: Revision
00: Initial Silicon
01: XA1 Silicon
10: Production Silicon

13.10.3 DCR1-Giga port status

CPU Address: hF02

Accessed by serial interface. (RO)



Bit [1:0]: Giga port 0 strap option
- 00 – 100Mb MII mode
- 01 – Reserved
- 10 – GMII
- 11 – PCS

Bit[3:2] Giga port 1 strap option
- 00 – 100Mb MII mode
- 01 – Reserved
- 10 – GMII
- 11 – PCS

Bit [7] Chip initialization completed

13.10.4 DPST – Device Port Status Register

CPU Address:hF03

Accessed by serial interface (R/W)

Bit[4:0]: Read back index register. This is used for selecting what to read back from DTST. **(Default 00)**

- 5’b00000 - Port 0 Operating mode and Negotiation status
- 5’b00001 - Port 1 Operating mode and Negotiation status
- 5’b00010 - Port 2 Operating mode and Negotiation status
- 5’b00011 - Port 3 Operating mode and Negotiation status

- 5’b00100 - Port 4 Operating mode and Negotiation status
- 5’b00101 - Port 5 Operating mode and Negotiation status
- 5’b00110 - Port 6 Operating mode and Negotiation status
- 5’b00111 - Port 7 Operating mode and Negotiation status
- 5’b01000 - Port 8 Operating mode and Negotiation status
- 5’b01001 - Port 9 Operating mode and Negotiation status
- 5’b01010 - Port 10 Operating mode and Negotiation status
- 5’b01011 - Port 11 Operating mode and Negotiation status
- 5’b01100 - Port 12 Operating mode and Negotiation status
- 5’b01101 - Port 13 Operating mode and Negotiation status
- 5’b01110 - Port 14 Operating mode and Negotiation status
- 5’b01111 - Port 15 Operating mode and Negotiation status
- 5’b10000 - Reserved
- 5’b10001 - Reserved
- 5’b10010 - Reserved
- 5’b00011 - Reserved
- 5’b10100 - Reserved
- 5’b10101 - Reserved
- 5’b10110 - Reserved
- 5’b10111 - Reserved
- 5’b11000 - Reserved
- 5’b11001 - Port 25 Operating mode/Neg status (Gigabit 1)
- 5’b11010 - Port 26 Operating mode/Neg status (Gigabit 2)

13.10.5 DTST – Data read back register

CPU Address: hF04

Accessed by serial interface (RO)

This register provides various internal information as selected in DPST bit[4:0]. Refer to the PHY Control Application Note.

7	6	5	4	3	2	1	0
MD		Sig	Giga	Inkdn	FE	Fdpx	FcEn

When bit is 1:

Bit[0] – Flow control enable

Bit[1] – Full duplex port

Bit[2] – Fast Ethernet port (if not gigabit port)

Bit[3] – Link is down

Bit[4] – Giga port

Bit[5] – Signal detect (when PCS interface mode)

Bit[6] - reserved

Bit[7] – Module detected (for hot swap purpose)

13.10.6 PLLCR - PLL Control Register

CPU Address: hF05

Accessed by serial interface (RW)

Bit[3] - Must be '1'

Bit[7] - Selects strap option or LCLK/OECLK registers

0 - Strap option (default)

1 - LCLK/OECLK registers

13.10.7 LCLK - LA_CLK delay from internal OE_CLK

CPU Address: hF06

Accessed by serial interface (RW)

PD[12:10]	LCLK	Delay
000b	80h	8 Buffers Delay
001b	40h	7 Buffers Delay
010b	20h	6 Buffers Delay
011b	10h	5 Buffers Delay (Recommend)
100b	08h	4 Buffers Delay
101b	04h	3 Buffers Delay
110b	02h	2 Buffers Delay
111b	01h	1 Buffers Delay

The LCLK delay from SCLK is the sum of the delay programmed in here and the delay in OECLK register.

13.10.8 OECLK - Internal OE_CLK delay from SCLK

CPU Address: hF07

Accessed by serial interface (RW)

The OE_CLK is used for generating the OE0 and OE1 signals.

PD[15:13]	OECLK	Delay
000b	80h	8 Buffers Delay
001b	40h	7 Buffers Delay (Recommend)
010b	20h	6 Buffers Delay
011b	10h	5 Buffers Delay
100b	08h	4 Buffers Delay
101b	04h	3 Buffers Delay
110b	02h	2 Buffers Delay
111b	01h	1 Buffers Delay

13.10.9 DA – DA Register

CPU Address: hFFF

Accessed by serial interface (RO)

Always return 8'h **DA**. Indicate the serial port connection is good.

13.11 TBI Registers

Two sets of TBI registers are used for configure the two Gigabit ports if they are operating in TBI mode. These TBI registers are located inside the switching chip and they are accessed through the MII command and MII data registers.

13.11.1 Control Register

MII Address: h00

Read/Write

Bit [15]	Reset PCS logic and all TBI registers 1 = Reset. 0 = Normal operation.
Bit [14]	Reserved. Must be programmed with "0".
Bit [13]	Speed selection (See bit 6 for complete details)
Bit [12]	Auto Negotiation Enable 1 = Enable auto-negotiation process. 0 = Disable auto-negotiation process (Default).
Bit [11:10]	Reserved. Must be programmed with "0"

Bit [9]	Restart Auto Negotiation. 1 = Restart auto-negotiation process. 0 = Normal operation (Default).
Bit [8:7]	Reserved.
Bit [6]	Speed Selection Bit[6][13] 1 1 = Reserved 0 =1000Mb/s (Default) 1 =100Mb/s 0 0 =10Mb/s
Bit [5:0]	Reserved. Must be programmed with “0”.

13.11.2 Status Register

MII Address: h01

Read Only

Bit [15:9]	Reserved. Always read back as “0”.
Bit [8]	Reserved. Always read back as “1”.
Bit [7:6]	Reserved. Always read back as “0”.
Bit [5]	Auto-Negotiation Complete 1 = Auto-negotiation process completed. 0 = Auto-negotiation process not completed.
Bit [4]	Reserved. Always read back as “0”
Bit [3]	Reserved. Always read back as “1”
Bit [2]	Link Status 1 = Link is up. 0 = Link is down.
Bit [1]	Reserved. Always read back as “0”.
Bit [0]	Reserved. Always read back as “1”.

13.11.3 Advertisement Register

MII Address: h04

Read/Write

Bit [15]	Next Page 1 = Has next page capabilities. 0 = Do not has next page capabilities (Default).
Bit [14]	Reserved. Always read back as “0”. Read Only.
Bit [13:12]	Remote Fault. Default is “0”.
Bit [11:9]	Reserved. Always read back as “0”. Read Only.
Bit [8:7]	Pause. Default is “00”
Bit [6]	Half Duplex 1 = Support half duplex (Default). 0 = Do not support half duplex.
Bit [5]	Full duplex 1 = Support full duplex (Default). 0 = Do not support full duplex.
Bit [4:0]	Reserved. Always read back as “0”. Read Only.

13.11.4 Link Partner Ability Register

MII Address: h05

Read Only

Bit [15]	Next Page 1 = Has next page capabilities. 0 = Do not has next page capabilities.
Bit [14]	Acknowledge
Bit [13:12]	Remote Fault.
Bit [11:9]	Reserved. Always read back as “0”.
Bit [8:7]	Pause.
Bit [6]	Half Duplex 1 = Support half duplex. 0 = Do not support half duplex.
Bit [5]	Full duplex 1 = Support full duplex. 0 = Do not support full duplex.
Bit [4:0]	Reserved. Always read back as “0”.

13.11.5 Expansion Register

MII Address: h06

Read Only

Bit [15:2]	Reserved. Always read back as “0”.
Bit [1]	Page Received. 1 = A new page has been received. 0 = A new page has not been received.
Bit [0]	Reserved. Always read back as “0”.

13.11.6 Extended Status Register

MII Address: h15

Read Only

Bit [15]	1000 Full Duplex 1 = Support 1000 full duplex operation (Default). 0 = Do not support 1000 full duplex operation.
Bit [14]	1000 Half Duplex 1 = Support 1000 half duplex operation (Default). 0 = Do not support 1000 half duplex operation.
Bit [13:0]	Reserved. Always read back as “0”.

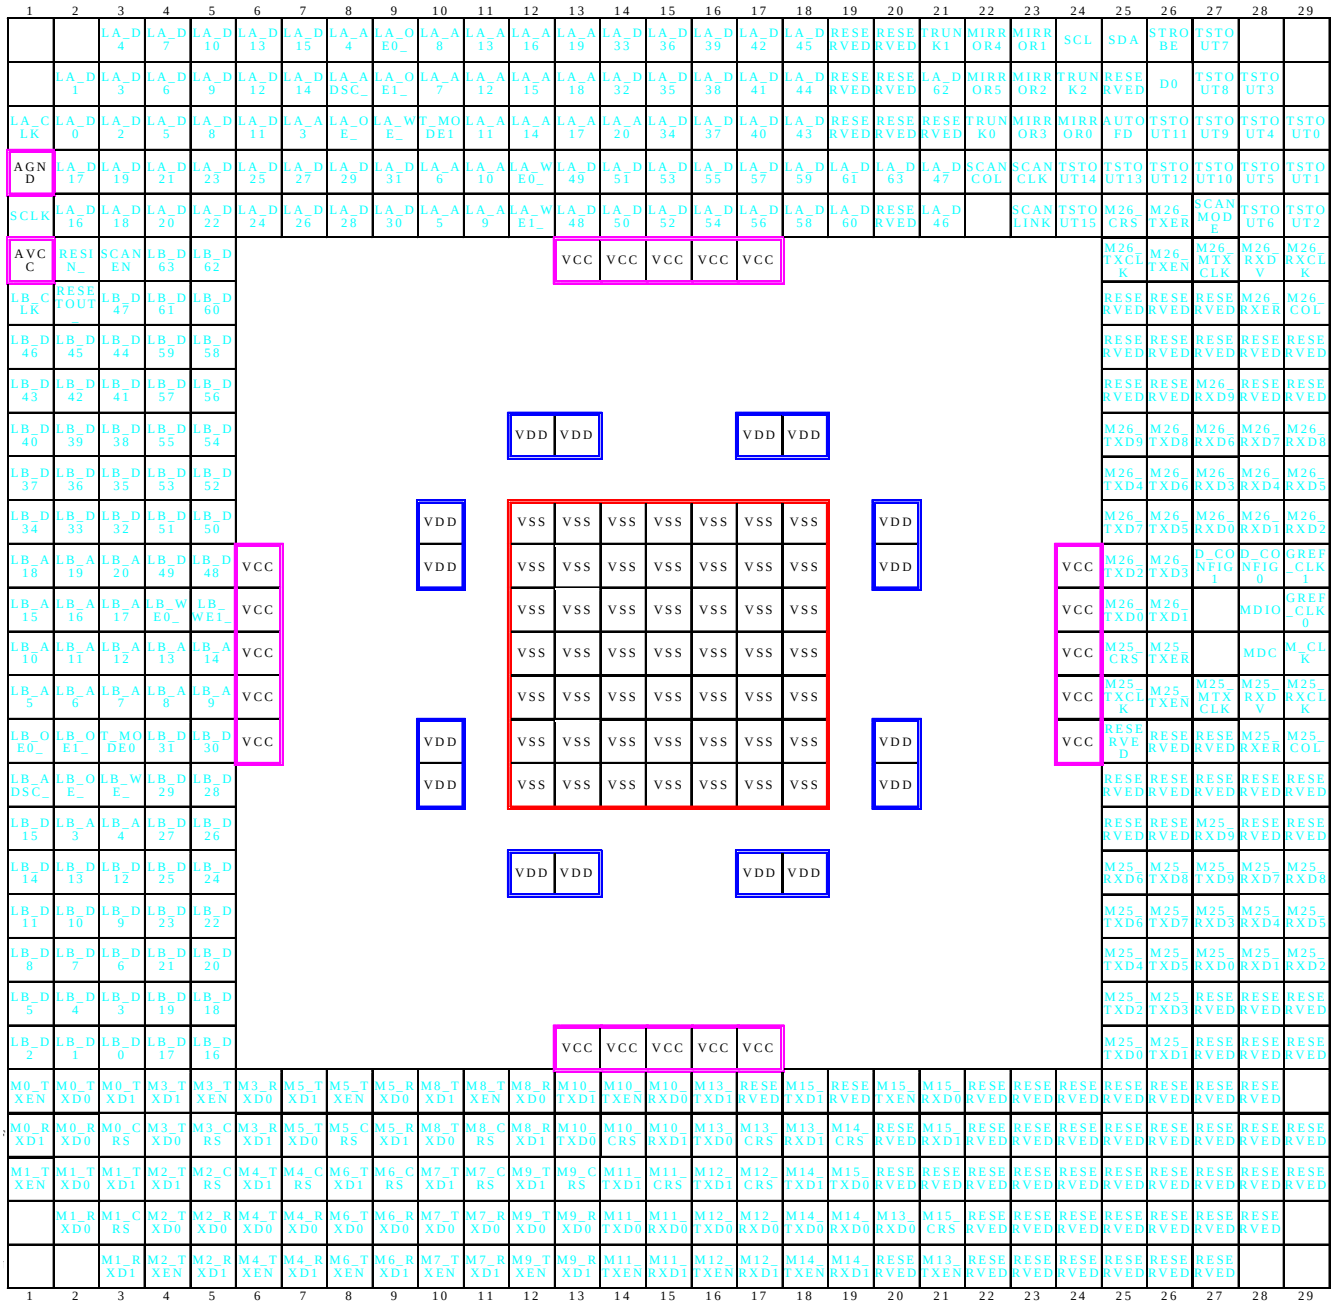
14.2 Power and Ground Distribution

The following figure provides an encapsulated view of the power and ground distribution.



14.2.1 Ball Signal Descriptions

Ball No(s)	Symbol	I/O	Description
I²C Interface Note: Use I²C and Serial control interface to configure the system			
A24	SCL	Output	I²C Data Clock
A25	SDA	I/O-TS with internal pull up	I²C Data I/O
Serial Control Interface			
A26	STROBE	Input with weak internal pull up	Serial Strobe Pin
B26	D0	Input with weak internal pull up	Serial Data Input
C25	AUTOFD	Output with pull up	Serial Data Output (AutoFD)
Frame Buffer Interface			
D20, B21, D19, E19,D18, E18, D17, E17, D16, E16, D15, E15, D14, E14, D13, E13, D21, E21, A18, B18, C18, A17, B17, C17, A16, B16, C16, A15, B15, C15, A14, B14, D9, E9, D8, E8, D7, E7, D6, E6, D5, E5, D4, E4, D3, E3, D2, E2, A7, B7, A6, B6, C6, A5, B5, C5, A4, B4, C4, A3, B3, C3, B2, C2	LA_D[63:0]	I/O-TS with pull up	Frame Bank A– Data Bit [63:0]
C14, A13, B13, C13, A12, B12, C12, A11, B11, C11, D11, E11, A10, B10, D10, E10, A8, C7	LA_A[20:3]	Output	Frame Bank A – Address Bit [20:3]
B8	LA_ADSC#	Output with pull up	Frame Bank A Address Status Control
C1	LA_CLK	Output with pull up	Frame Bank A Clock Input
C9	LA_WE#	Output with pull up	Frame Bank A Write Chip Select for one layer SRAM application
D12	LA_WE0#	Output with pull up	Frame Bank A Write Chip Select for lower layer of two bank SRAM application
E12	LA_WE1#	Output with pull up	Frame Bank A Write Chip Select for upper bank of two layer SRAM application

Ball No(s)	Symbol	I/O	Description
C8	LA_OE#	Output with pull up	Frame Bank A Read Chip Select for one layer SRAM application
A9	LA_OE0#	Output with pull up	Frame Bank A Read Chip Select for lower layer of two layers SRAM application
B9	LA_OE1#	Output with pull up	Frame Bank A Read Chip Select for upper layer of two layers SRAM application
F4, F5, G4, G5, H4, H5, J4, J5, K4, K5, L4, L5, M4, M5, N4, N5, G3, H1, H2, H3, J1, J2, J3, K1, K2, K3, L1, L2, L3, M1, M2, M3, U4, U5, V4, V5, W4, W5, Y4, Y5, AA4, AA5, AB4, AB5, AC4, AC5, AD4, AD5, W1, Y1, Y2, Y3, AA1, AA2, AA3, AB1, AB2, AB3, AC1, AC2, AC3, AD1, AD2, AD3	LB_D[63:0]	I/O-TS with pull up.	Frame Bank B– Data Bit [63:0]
N3, N2, N1, P3, P2, P1, R5, R4, R3, R2, R1, T5, T4, T3, T2, T1, W3, W2	LB_A[20:3]	Output	Frame Bank B – Address Bit [20:3]
V1	LB_ADSC#	Output with pull up	Frame Bank B Address Status Control
G1	LB_CLK	Output with pull up	Frame Bank B Clock Input
V3	LB_WE#	Output with pull up	Frame Bank B Write Chip Select for one layer SRAM application
P4	LB_WE0#	Output with pull up	Frame Bank B Write Chip Select for lower layer of two layers SRAM application
P5	LB_WE1#	Output with pull up	Frame Bank B Write Chip Select for upper layer of two layers SRAM application
V2	LB_OE#	Output with pull up	Frame Bank B Read Chip Select for one layer SRAM application
U1	LB_OE0#	Output with pull up	Frame Bank B Read Chip Select for lower layer of two layers SRAM application
U2	LB_OE1#	Output with pull up	Frame Bank B Read Chip Select for upper layer of two layers SRAM application

Ball No(s)	Symbol	I/O	Description
Fast Ethernet Access Ports [15:0] RMII			
R28	M_MDC	Output	MII Management Data Clock – (Common for all MII Ports [15:0])
P28	M_MDIO	I/O-TS with pull up	MII Management Data I/O – (Common for all MII Ports – [15:0])
R29	M_CLKI	Input	Reference Input Clock
AF21, AJ19, AF18, AJ17, AJ15, AF15, AJ13, AF12, AJ11, AJ9, AF9, AJ7, AF6, AJ5, AJ3, AF1	M[15:0]_RXD[1]	Input with weak internal pull up resistors.	Ports [15:0] – Receive Data Bit [1]
AE21, AH19, AH20, AH17, AH15, AE15, AH13, AE12, AH11, AH9, AE9, AH7, AE6, AH5, AH2, AF2	M[15:0]_RXD[0]	Input with weak internal pull up resistors	Ports [15:0] – Receive Data Bit [0]
AH21, AF19, AF17, AG17, AG15, AF14, AG13, AF11, AG11, AG9, AF8, AG7, AF5, AG5, AH3, AF3	M[15:0]_CRS_DV	Input with weak internal pull down resistors.	Ports [15:0] – Carrier Sense and Receive Data Valid
AE20, AJ18, AJ21, AJ16, AJ14, AE14, AJ12, AE11, AJ10, AJ8, AE8, AJ6, AE5, AJ4, AG1, AE1	M[15:0]_TXEN	I/O- TS with pull up, slew	Ports [15:0] – Transmit Enable Strap option for RMII/GPSI
AE18, AG18, AE16, AG16, AG14, AE13, AG12, AE10, AG10, AG8, AE7, AG6, AE4, AG4, AG3, AE3	M[15:0]_TXD[1]	Output, slew	Ports [15:0] – Transmit Data Bit [1]
AG19, AH18, AF16, AH16, AH14, AF13, AH12, AF10, AH10, AH8, AF7, AH6, AF4, AH4, AG2, AE2	M[15:0]_TXD[0]	Output, slew	Ports [15:0] – Transmit Data Bit [0]
GMII/TBI GiGabit Ethernet Access Ports 0 & 1			
Y27, Y26, AA26, AA25, AB26, AB25, AC26, AC25, AD26, AD25	M25_TXD[9:0]	Output	Transmit Data Bit [9:0]
T28	M25_RX_DV	Input w/ pulldown	Receive Data Valid
U28	M25_RX_ER	Input w/ pullup	Receive Error
R25	M25_CRS	Input w/ pulldown	Carrier Sense

Ball No(s)	Symbol	I/O	Description
U29	M25_COL	Input w/ pullup	Collision Detected
T29	M25_RXCLK	Input w/ pullup	Receive Clock
W27, Y29, Y28, Y25, AA29, AA28, AA27, AB29, AB28, AB27	M25_RXD[9:0]	Input w/ pullup	Receive Data Bit [9:0]
T26	M25_TX_EN	Output w/ pullup	Transmit Data Enable
R26	M25_TX_ER	Output w/ pullup	Transmit Error
T25	M25_ TXCLK	Output	Gigabit Transmit Clock
P29	GREF_CLK0	Input w/ pullup	Gigabit Reference Clock
K25, K26, M25, L26, M26, L25, N26, N25, P26, P25	M26_TXD[9:0]	Output	Transmit Data Bit [9:0]
F28	M26_RX_DV	Input w/ pulldown	Receive Data Valid
G28	M26_RX_ER	Input w/ pullup	Receive Error
E25	M26_CRS	Input w/ pulldown	Carrier Sense
G29	M26_COL	Input w/ pullup	Collision Detected
F29	M26_RXCLK	Input w/ pullup	Receive Clock
J27, K29, K28, K27, L29, L28, L27, M29, M28, M27	M26_RXD[9:0]	Input w/ pullup	Receive Data Bit [9:0]
F26	M26_TX_EN	Output w/ pullup	Transmit Data Enable
E26	M26_TX_ER	Output w/ pullup	Transmit Error
F25	M26_ TXCLK	Output	Gigabit Transmit Clock
N29	GREF_CLK1	Input w/ pullup	Gigabit Reference Clock
LED Interface			
C29	LED_CLK/TSTOUT0	I/O- TS with pull up	LED Serial Interface Output Clock
D29	LED_SYN/TSTOUT1	I/O- TS with pull up	LED Output Data Stream Envelope
E29	LED_BIT/TSTOUT2	I/O- TS with pull up	LED Serial Data Output Stream
B28	G1_RXTX#/TSTOUT3	I/O- TS with pull up	LED for Gigabit port 1 (receive + transmit)
C28	G1_DPCOL#/TSTOUT4	I/O- TS with pull up	LED for Gigabit port 1 (full duplex + collision)
D28	G1_LINK#/TSTOUT5	I/O- TS with pull up	LED for Gigabit port 1
E28	G2_RXTX#/TSTOUT6	I/O- TS with pull up	LED for Gigabit port 2 (receive + transmit)

Ball No(s)	Symbol	I/O	Description
A27	G2_DPCOL#/TSTOUT7	I/O- TS with pull up	LED for Gigabit port 2 (full duplex + collision)
B27	G2_LINK#/TSTOUT8	I/O- TS with pull up	LED for Gigabit port 2
C27	INIT_DONE/TSTOUT9	I/O- TS with pull up	System start operation
D27	INIT_START/TSTOUT10	I/O- TS with pull up	Start initialization
C26	CHECKSUM_OK/TSTOUT11	I/O- TS with pull up	EEPROM read OK
D26	FCB_ERR/TSTOUT12	I/O- TS with pull up	FCB memory self test fail
D25	MCT_ERR/TSTOUT13	I/O- TS with pull up	MCT memory self test fail
D24	BIST_IN_PRC/TSTOUT14	I/O- TS with pull up	Processing memory self test
E24	BIST_DONE/TSTOUT15	I/O- TS with pull up	Memory self test done
Trunk Enable			
C22	TRUNK0	Input w/ weak internal pull down resistors	Trunk Port Enable in unmanaged mode In managed mode doesn't care
A21	TRUNK1	Input w/ weak internal pull down resistors	Trunk Port Enable in unmanaged mode In managed mode doesn't care
B24	TRUNK2	Input w/ weak internal pull down resistors	Trunk Port Enable in unmanaged mode In managed mode doesn't care
Test Facility			
U3, C10	T_MODE0, T_MODE1	I/O-TS	Test Pins 00 – Test mode – Set Mode upon Reset, and provides NAND Tree test output during test mode 01 - Reserved - Do not use 10 - Reserved - Do not use 11 – Normal mode. Use external pull up for normal mode
F3	SCAN_EN	Input with pull down	Scan Enable 0 - Normal mode (open)
E27	SCANMODE	Input with pull down	1 – Enable Test mode 0 - Normal mode (open)
System Clock, Power, and Ground Pins			

Ball No(s)	Symbol	I/O	Description
E1	SCLK	Input	System Clock at 100 MHz
K12, K13, K17,K18 M10, N10, M20, N20, U10, V10, U20, V20, Y12, Y13, Y17, Y18	VDD	Power	+2.5 Volt DC Supply
F13, F14, F15, F16, F17, N6, P6, R6, T6, U6, N24, P24, R24, T24, U24, AD13, AD14, AD15, AD16, AD17	VCC	Power	+3.3 Volt DC Supply
M12, M13, M14, M15, M16, M17, M18, N12, N13, N14, N15, N16, N17, N18, P12, P13, P14, P15, P16, P17, P18, R12, R13, R14, R15, R16, R17, R18, T12, T13, T14, T15, T16, T17, T18, U12, U13, U14, U15, U16, U17, U18, V12, V13, V14, V15, V16, V17, V18,	VSS	Power Ground	Ground
F1	AVCC	Analog Power	Analog +2.5 Volt DC Supply
D1	AGND	Analog Ground	Analog Ground
MISC			
D22	SCANCOL	Input	Scans the Collision signal of Home PHY
D23	SCANCLK	Input/ output	Clock for scanning Home PHY collision and link
E23	SCANLINK	Input	Link up signal from Home PHY
F2	RESIN#	Input	Reset Input
G2	RESETOUT_	Output	Reset PHY

Ball No(s)	Symbol	I/O	Description
AC29, AE28, AJ27, AF27, AJ25, AF24, AH23, AE19, AC27, AF29, AG27, AF26, AG25, AG23, AF23, AG21, AC28, AF28, AH27, AE27, AH25, AE24, AF22, AF20, AD29, AG28, AJ26, AE26, AJ24, AE23, AJ22, AJ20, AD27, AH28, AG26, AE25, AG24, AE22, AJ23, AG20, AD28, AG29, AH26, AF25, AH24, AG22, AH22, AE17, G27, H29, H28, H27, J29, J28, U26, U25, V26, V25, W26, W25, G26, G25, H26, H25, J26, J25, U27, V29, V28, V27, W29, W28, B22, A22, C23, B23, A23, C24, E20, B25	RESERVED	NA	Reserved Pins. Leave unconnected.
Bootstrap Pins (Default = pull up, 1= pull up 0= pull down)			
After reset TSTOUT0 to TSTOU15 are used by the LED interface.			
C29	TSTOUT0	Default 1	GIGA Link polarity 0 – active low 1 – active high
D29	TSTOUT1	Default 1	RMII MAC Power Saving Enable 0 – No power saving 1 – power saving
E29	TSTOUT2	Default 1 Recommend disable (0) with pull-down	Giga Half Duplex Support 0 - Disable 1 - Enable
B28	TSTOUT3	Default 1	Module detect enable 0 – Hot swap enable 1 – Hot swap disable
C28	TSTOUT4		Reserved
D28	TSTOUT5	Default 1	Scan Speed: ¼ SCLK or SCLK 0 – ¼ SCLK (HPNA) 1 - SCLK
E28	TSTOUT6		Reserved

Ball No(s)	Symbol	I/O	Description
A27	TSTOUT7	Default 1	Memory Size 0 - 256K x 32 or 256K x 64 (4M total) 1 - 128K x 32 or 128K x 64 (2M total)
B27	TSTOUT8	Default 1	EEPROM Installed 0 – EEPROM installed 1 – EEPROM not installed
C27	TSTOUT9	Default 1	MCT Aging 0 – MCT aging disable 1 – MCT aging enable
D27	TSTOUT10	Default 1	FCB Aging 0 - FCB aging disable 1 – FCB aging enable
C26	TSTOUT11	Default 1	Timeout Reset 0 – Time out reset disable 1 – Time out reset enable. Issue reset if any state machine did not go back to idle for 5sec.
D26	TSTOUT12		Reserved
D25	TSTOUT13	Default 1	FDB RAM depth (1 or 2 layers) 0 – 2 layer 1 – 1 layer
D24	TSTOUT14		Reserved
E24	TSTOUT15	Default 1	SRAM Test Mode 0 – Enable test mode 1 – Normal operation
T26, R26	G0_TXEN, G0_TXER	Default: PCS	Giga0 Mode: G0_TXEN G0_TXER 0 0 MII 0 1 RSVD 1 0 GMII 1 1 PCS
F26, E26	G1_TXEN, G1_TXER	Default: PCS	Giga1 Mode: G1_TXEN G1_TXER 0 0 MII 0 1 RSVD 1 0 GMII 1 1 PCS

Ball No(s)	Symbol	I/O	Description
AE20, AJ18, AJ21, AJ16, AJ14, AE14, AJ12, AE11, AJ10, AJ8, AE8, AJ6, AE5, AJ4, AG1, AE1,	M[15:0]_TXEN	Default: RMII	0 – GPSI 1 - RMII
C21	P_D	Must be pulled-down	Reserved - Must be pulled-down
C19, B19, A19	OE_CLK[2:0]	Default: 111	Programmable delay for internal OE_CLK from SCLK input. The OE_CLK is used for generating the OE0 and OE1 signals. Suggested value is 011.
C20, B20, A20	LA_CLK[2:0]	Default: 111	Programmable delay for LA_CLK and LB_CLK from internal OE_CLK. The LA_CLK and LB_CLK delay from SCLK is the sum of the delay programmed in here and the delay in P_D[15:13]. Suggested value is 011.

Notes:

# =	Active low signal
Input =	Input signal
In-ST =	Input signal with Schmitt-Trigger
Output =	Output signal (Tri-State driver)
Out-OD=	Output signal with Open-Drain driver
I/O-TS=	Input & Output signal with Tri-State driver
I/O-OD =	Input & Output signal with Open-Drain driver

14.4 AC/DC Timing

14.4.1 Absolute Maximum Ratings

Storage Temperature-65C to +150C

Operating Temperature-40^{o}C to + 85^{o}C

Supply Voltage VCC with Respect to V_{SS}+3.0 V to +3.6 V

Supply Voltage VDD with Respect to V_{SS}+2.38 V to +2.75 V

Voltage on Input Pins-0.5 V to (VCC + 3.3 V)

Caution: Stress above those listed may damage the device. Exposure to the Absolute Maximum Ratings for extended periods may affect device reliability. Functionality at or above these limits is not implied.

14.4.2 DC Electrical Characteristics

VCC = 3.0 V to 3.6 V (3.3v +/- 10%)$T_{AMBIENT}$ = -40 C to +85 C

VDD = 2.5V +10% - 5%

14.4.3 Recommended Operation Conditions

Symbol	Parameter Description	Preliminary			Unit
		Min	TypE	Max	
f_{osc}	Frequency of Operation		100		MHz
I_{DD1}	Supply Current – @ 100 MHz (VCC=3.3 V)			450	mA
I_{DD2}	Supply Current – @ 100 MHz (VDD =2.5 V)			1500	mA
V_{OH}	Output High Voltage (CMOS)	VCC - 0.5			V
V_{OL}	Output Low Voltage (CMOS)			0.5	V
V_{IH-TTL}	Input High Voltage (TTL 5V tolerant)	VCC x 70%		VCC + 2.0	V
V_{IL-TTL}	Input Low Voltage (TTL 5V tolerant)			VCC x 30%	V
I_{IH-5VT}	Input Leakage Current (0.1 V < V_{IN} < VDD2) (all pins except those with internal pull-up/pull-down resistors)			10	µA
C_{IN}	Input Capacitance			5	pF
C_{OUT}	Output Capacitance			5	pF
$C_{I/O}$	I/O Capacitance			7	pF
θ_{ja}	Thermal resistance with 0 air flow			11.2	C/W
θ_{ja}	Thermal resistance with 1 m/s air flow			10.2	C/W
θ_{ja}	Thermal resistance with 2m/s air flow			8.9	C/W

14.5 Local Frame Buffer SBRAM Memory Interface

14.5.1 Local SBRAM Memory Interface:

G8	M[26]_CRS Input Hold Times	1		
G12	M[26]_TXD[7:0] Output Delay Times	1	6	C_L = 20pf
G13	M[26]_TX_EN Output Delay Times	1	6.5	C_L = 20pf
G14	M[26]_TX_ER Output Delay Times	1	6	C_L = 20pf

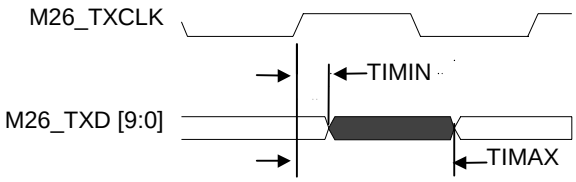

Figure 29 - Gigabit TBI Interface Transmit Timing

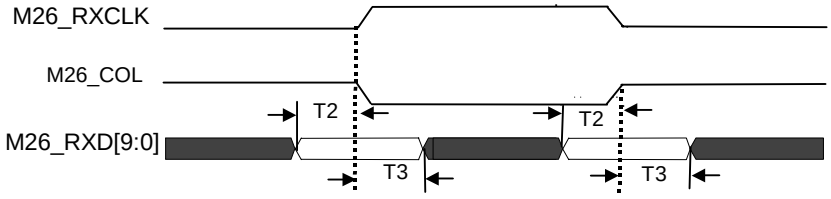

Figure 30 - Gigabit TBI Interface Timing

Symbol	Parameter	Min (ns)	Max (ns)	Note:
T1	M26_TXD[9:0] Output Delay Time	1	6	C_L = 20pf

Table 14 - Output Delay Timing

Symbol	Parameter	Min (ns)	Max (ns)	Note:
T2	M26_RXD[9:0] Input Setup Time	3		
T3	M26_RXD[9:0] Input Hold Time	3		

Table 15 - Input Setup Timing

14.7.3 LED Interface

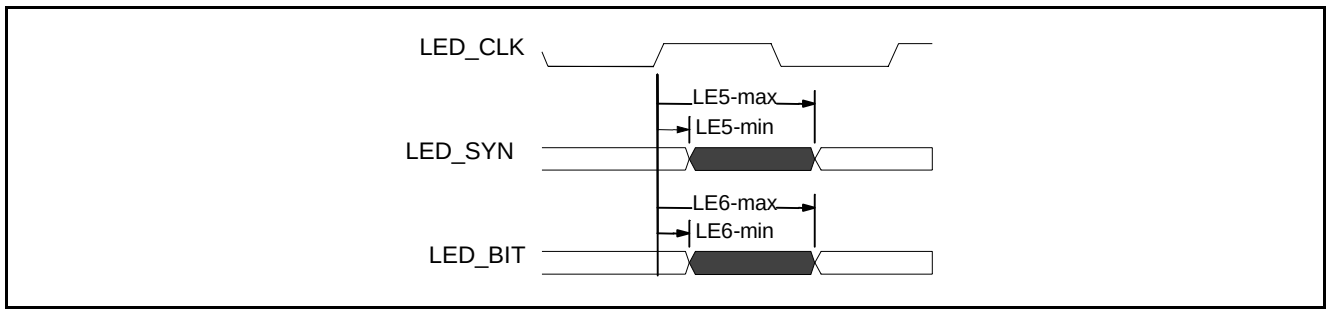

Figure 31 - AC Characteristics – LED Interface

Symbol	Parameter	Variable FREQ.		Note:
		Min (ns)	Max (ns)	
LE5	LED_SYN Output Valid Delay	-1	7	C_L = 30pf
LE6	LED_BIT Output Valid Delay	-1	7	C_L = 30pf

Table 17- AC Characteristics – LED Interface

14.7.4 SCANLINK SCANCOL Output Delay Timing

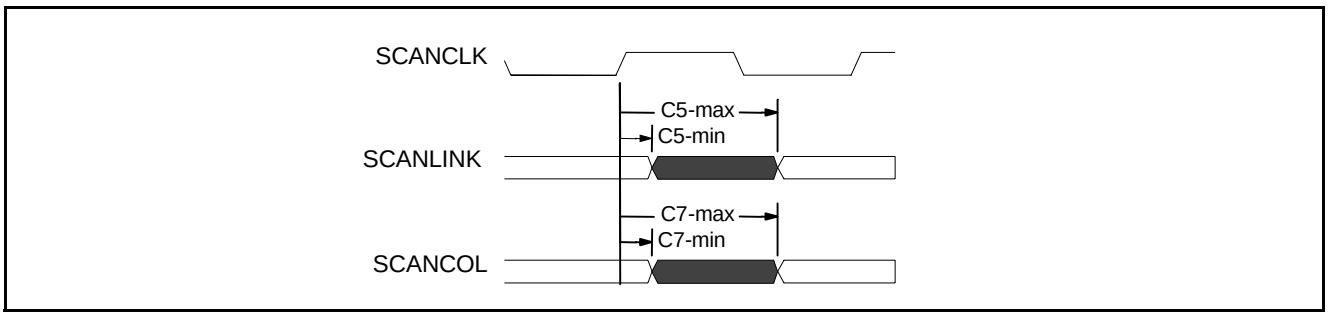

Figure 32 - SCANLINK SCANCOL Output Delay Timing

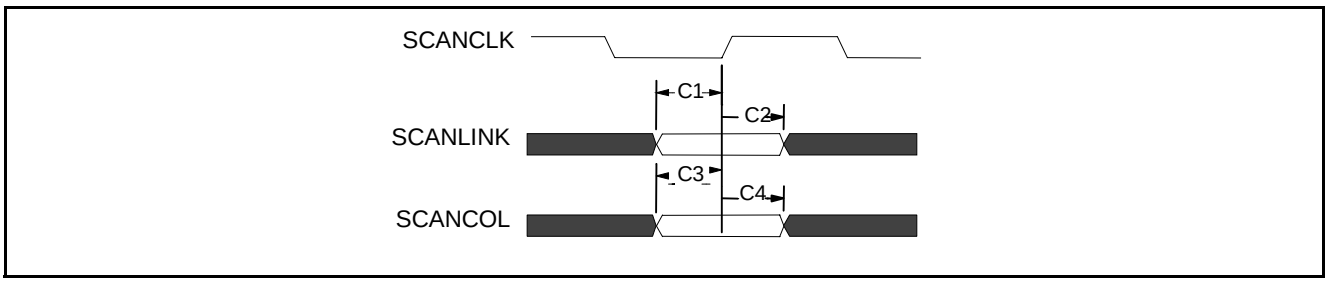

Figure 33 - SCANLINK, SCANCOL Setup Timing

Symbol	Parameter	-25MHz		Note:
		Min (ns)	Max (ns)	
C1	SCANLINK input set-up time	20		
C2	SCANLINK input hold time	2		
C3	SCANCOL input setup time	20		
C4	SCANCOL input hold time	1		
C5	SCANLINK output valid delay	0	10	C_L = 30pf
C7	SCANCOL output valid delay	0	10	C_L = 30pf

Table 16 - SCANLINK, SCANCOL Timing

14.7.5 MDIO Input Setup and Hold Timing

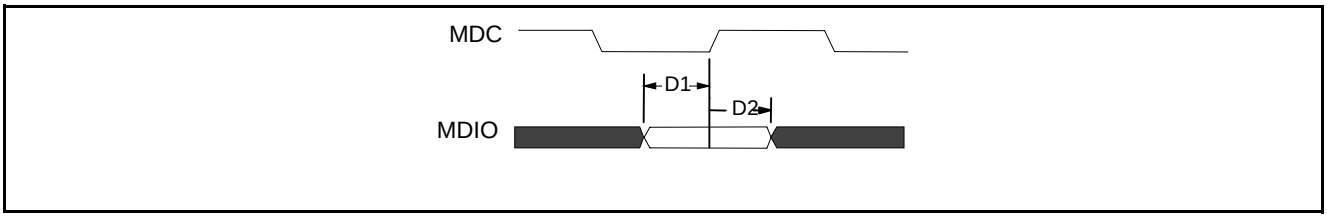

Figure 34 - MDIO Input Setup and Hold Timing

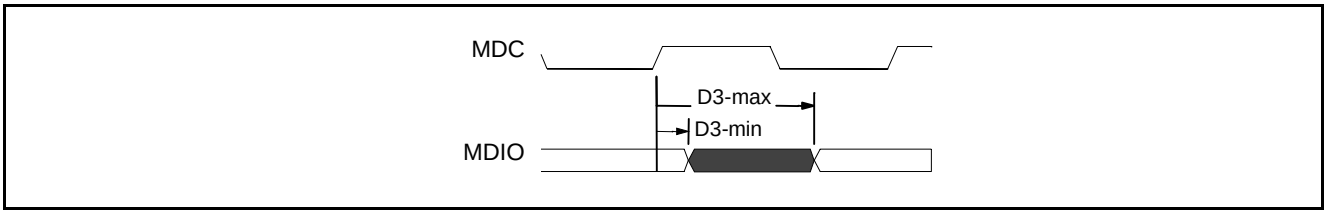

Figure 35 - MDIO Output Delay Timing

Symbol	Parameter	1MHz		Note:
		Min (ns)	Max (ns)	
D1	MDIO input setup time	10		
D2	MDIO input hold time	2		
D3	MDIO output delay time	1	20	C_L = 50pf

Table 17 - MDIO Timing

14.7.6 I²C Input Setup Timing

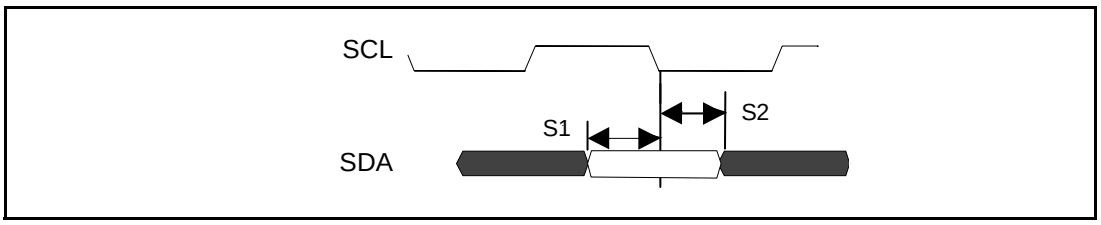

Figure 36 - I²C Input Setup Timing

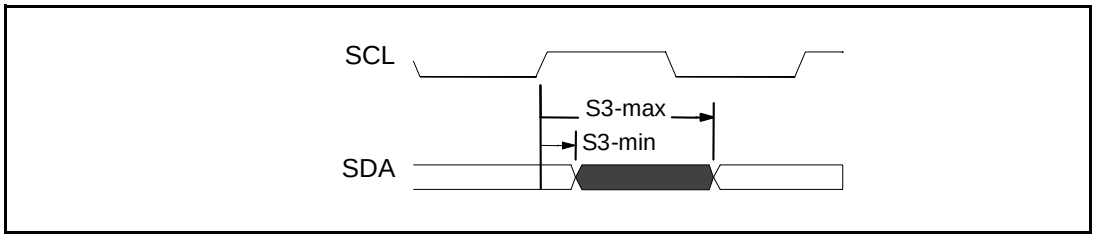

Figure 37 - I²C Output Delay Timing

Symbol	Parameter	50KHz		Note:
		Min (ns)	Max (ns)	
S1	SDA input setup time	20		
S2	SDA input hold time	1		
S3*	SDA output delay time	4 usec	6 usec	C_L = 30pf
* Open Drain Output. Low to High transistor is controlled by external pullup resistor.				

Table 18 - I²C Timing

14.7.7 Serial Interface Setup Timing

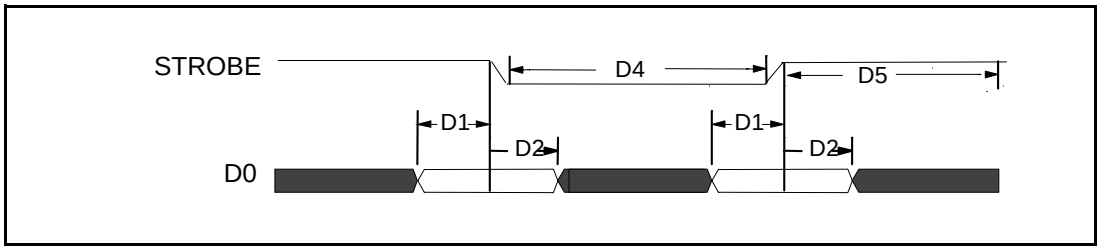

Figure 38 - Serial Interface Setup Timing

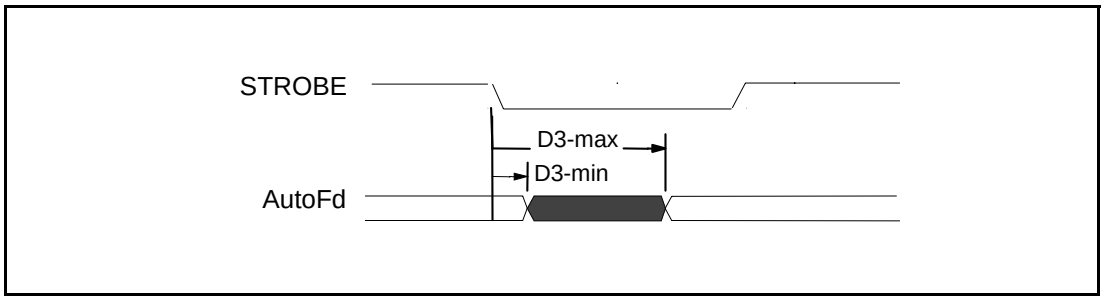

Figure 39 - Serial Interface Output Delay Timing

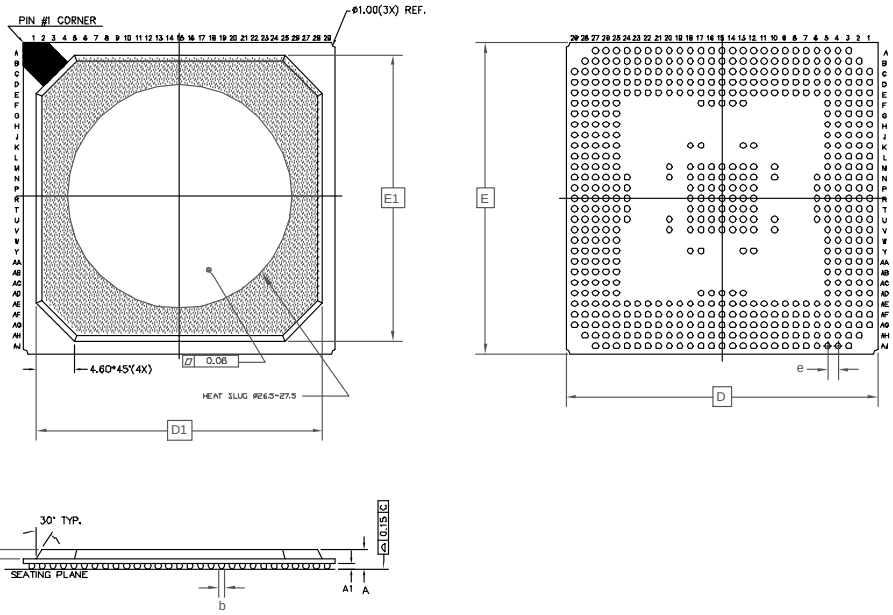
Symbol	Parameter	Min (ns)	Max (ns)	Note:
D1	D0 setup time	20		
D2	D0 hold time	3µs		
D3	AutoFd output delay time	1	50	C_L = 100pf
D4	Strobe low time	5µs		
D5	Strobe high time	5µs		

Table 19 - Serial Interface Timing



DIMENSION	MIN	MAX
A	2.20	2.46
A1	0.50	0.70
A2	1.17 REF	
D	37.30	37.70
D1	34.50 REF	
E	37.30	37.70
E1	34.50 REF	
b	0.60	0.90
e	1.27	
N	553	
Conforms to JEDEC MS - 034		

NOTE:

1. CONTROLLING DIMENSIONS ARE IN MM
2. DIMENSION "b" IS MEASURED AT THE MAXIMUM SOLDER BALL DIAMETER
3. SEATING PLANE IS DEFINED BY THE SPHERICAL CROWNS OF THE SOLDER BALLS.
4. N IS THE NUMBER OF SOLDER BALLS
5. NOT TO SCALE.
6. SUBSTRATE THICKNESS IS 0.56 MM

ISSUE	1			
ACN	213932			
DATE	20Jan03			
APPRD.				

ZARLINK SEMICONDUCTOR

Previous package codes: BH / G

Package Code GK

Package Outline for 553 Ball HSBGA (37.5x37.5x2.33mm)

GPD00818
