

### FEATURES

- HIGH FREQUENCY OPERATION TO 1 GHz
- LOW SUPPLY VOLTAGE: 2.2 V to 3.5 V
- LOW SUPPLY CURRENT: 5.5 mA
- AVAILABLE IN TAPE AND REEL (G08 PACKAGE)

### DESCRIPTION

The UPB587 series of devices are silicon bipolar digital prescalers which can be operated in divide-by-two, divide-by-four or divide-by-eight mode. They feature frequency response to 1 GHz, and operate from a single 3 volt supply drawing only 5.5 milliamps. The series is available in two package styles: 8 lead ceramic flat pack (UPB587B), and an 8 pin plastic mini-flat package (UPB587G). Applications include: synthesizer for DBS receiver and telecommunication applications. The low DC voltage required and power-saving current draw make them ideal for hand-held, battery-powered applications.

### TEST CIRCUIT

#### Notes:

1. V<sub>CC1</sub> = 2.2 V to 3.5 V, V<sub>CC2</sub> = 2.2 to 3.5 V.
2. Mounted on a 5 x 5 x 0.16 mm epoxy glass circuit board.
3. To improve impedance match to a 50 Ω load, a 1.2 KΩ shunt resistor on the output line is recommended.

**RECOMMENDED OPERATING CONDITIONS**

SYMBOL	PARAMETER	UNITS	RATINGS
Vcc1, Vcc2	Supply Voltage	V	2.2 to 3.5
TOP	Operating Temperature	°C	-20 to +75

Note: Because of the high internal gain and gain compression of the UPB587, this device is prone to self-oscillation in the absence of an RF input signal. If the device will be used in an application where DC power will be applied in the absence of an RF input signal, this self-oscillation can be suppressed by any of the following means:

- \* Add a shunt resistor from the RF input line to ground. The blocking capacitor should be between the resistor and the UPB587, but physical separation should be minimized. Typically a resistor value between 50 and 100 ohms will suppress the self-oscillation.
- \* Apply a DC offset voltage of +2.0 volts to the INPUT pin. The voltage source should be isolated from the INPUT pin by a series 1000 ohm resistor.
- \* Apply a DC offset voltage of +1.0 volts to the BYPASS pin. The voltage source should be isolated from the BYPASS pin by a series 1000 ohm resistor.

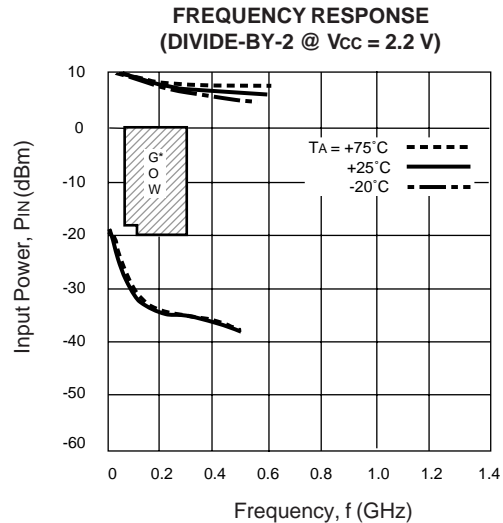

All these approaches reduce the input sensitivity of the UPB587 (by as much as 3 dB for the example of a 50 ohm shunt resistor), but otherwise have no affect on the reliability or other electrical characteristics of this device.
