

## Features

- 667 Mb/s port data bandwidth, >85Gb/s aggregate bandwidth
- Low power CMOS, 2.5V and 3.3V power supply
- SRAM-based, in-system programmable
- LVDS I/O (OCX256L) and LVPECL I/O (OCX256P) versions
- 256 configurable I/O ports
  - 128 dedicated differential input ports
  - 128 dedicated differential output ports
  - LVTTTL control interface
  - Output Enable control for all outputs
- Non-blocking switch matrix
  - Patented ActiveArray™ matrix for superior performance
  - Double-buffered configuration RAM cells for simultaneous global updates
  - ImpliedDisconnect™ function for single cycle disconnect/connect
- Full Broadcast and multicast capability
  - One-to-One and One-to-Many connections
  - Special broadcast mode routes one input to all outputs at maximum data rate
- Registered and flow-through data modes
  - 333 MHz synchronous mode
  - 667 Mb/s asynchronous mode
  - Low jitter and signal skew
  - Low duty cycle distortion
- RapidConfigure™ parallel interface for configuration and readback
- JTAG serial interface for configuration and Boundary Scan testing
- 792 TBGA package with 1.00mm ball spacing
- Integrated Termination Resistors

## Description

The OCX256 SRAM-based devices are non-blocking 128 X 128 digital crosspoint switches and are available in LVDS (Low Voltage Differential Signaling) and LVPECL (Low Voltage PECL) versions. Both devices are capable of data rates of 667 Megabits per second per port. The I/O ports are fixed as either input or output ports. The input ports support flow-through mode only. The output ports are individually programmable to operate in either flow-through (asynchronous) or registered (synchronous) mode. Each output register may be clocked by a global clock or a next neighbor clock source.

The patented ActiveArray provides greater density, superior performance, and greater flexibility compared to a traditional *n:1* multiplexer architecture. The OCX™ devices support various operating modes covering one input to one output at a time as well as one input to many outputs, plus a special broadcast mode to program one input to all outputs while maintaining maximum data rates. In all modes data integrity and connections are maintained on all unchanged data paths.

The RapidConfigure parallel interface allows fast configuration of both the Output Buffers and the switch matrix. Readback is supported for device test and verification purposes. The OCX256 also supports the industry standard JTAG (IEEE 1149.1) interface for boundary scan testing. The JTAG interface can also be used to download configuration data to the device and readback data. A functional block diagram of the OCX256 is shown in Figure 1.

## Applications

- SONET/SDH and DWDM
- Digital Cross-Connects
- System Backplanes and Interconnects
- High Speed Test Equipment
- ATM Switch Cores
- Video Switching

## 1. Introduction

The OCX256 is a differential crosspoint-switching device. The main functional block of the device is a Switch Matrix as shown in Figure 1. The Switch Matrix is a  $x$ - $y$  structure supporting an input-to-output data flow. Figure 2 shows a conceptual view of the switch matrix with inputs connected to the horizontal trace and outputs to the vertical trace. Connections between vertical and horizontal lines are implemented with a proprietary high-performance buffering circuit. Signal path delays through the Switch Matrix are very well balanced, resulting in predictable and uniform pin-to-pin delays.

**Note** – For the purpose of clarity, the logic diagrams within this datasheet are conceptual representations only and do not show actual circuit implementation.

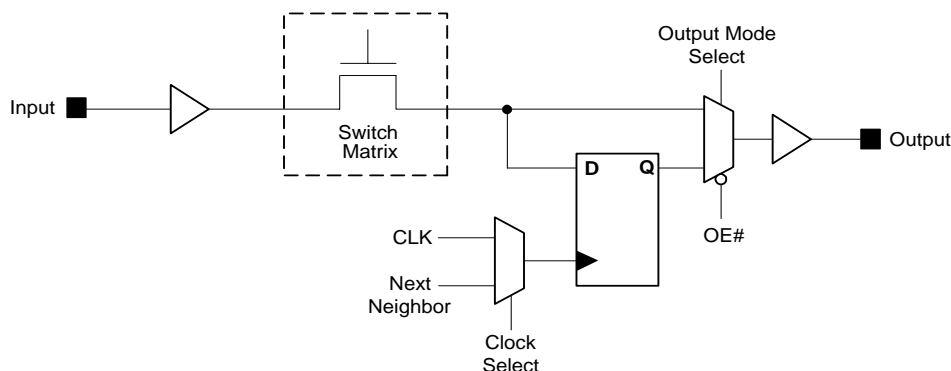

**Figure 2 OCX256 Switch Matrix**

The Active SRAM cells are responsible for establishing connections in the switch matrix by turning on the interconnect circuit, while the Loading SRAM cell can be used to store a second configuration that can be transferred to the Active SRAM cell at a later time. The two SRAM cells are arranged so that a double buffered scheme can be employed. Through the use of an internal signal (generated automatically during a programming cycle) it is possible to store a second configuration map in the Loading SRAM while the Active SRAM maintains its present connection status. When the UPDATE# signal is asserted low (# denotes active low), the contents of the Loading SRAM cell are transferred to the Active SRAM cell and the switch matrix connection is either made or broken.

The UPDATE# signal can be used to control when the switch matrix is reconfigured. For instance, as long as the UPDATE# signal is de-asserted (held high), the Loading SRAM cells for the entire switch matrix could be changed without affecting the current configuration of the switch. When the UPDATE# signal is asserted low, the entire switch matrix would be reconfigured simultaneously. If the UPDATE# signal is asserted continuously, all crosspoint programming commands (generated by RapidConfigure or JTAG programming cycles) will take effect immediately, since the Loading SRAM cell's contents will be transferred directly to the Active SRAM cell.

## 1.1 Input and Output Buffers

All of the input buffers are differential inputs with flow-through mode. The output buffers are programmable for either flow-through or registered mode. Figure 3 shows the basic block diagram of the input and output blocks with the sources for the output control signals (OE# and CLK). The control signals are explained in more details in the following sections.

**Figure 3 Input and Output Buffer Configuration**

### 1.1.1 Input and Output Port Function Mode

The following legend describes the various modes of the Input and Output Ports and the specification used by the OCXPro™ Software.

Legend:

**Ax**—Switch Matrix Signal

**Px**—Port Signal

**OE#**—Output Enable (# means “Active Low”)

**CLK**—Clock

**Table 1 Summary for Programmable I/O Attributes for OCX256**

Symbol	I/O Port Function	Mnemonic
	<b>Input</b> – The external signal is buffered from the Input Port pin to the corresponding Switch Matrix line.	<b>IN</b>
	<b>Output</b> – The internal signal is buffered from the corresponding Switch Matrix line to the Output Port pin. In this mode an optional output enable (OE#) can be selected. The default state is logic high with enable set to ON.	<b>OP</b>
	<b>Registered Output</b> – The internal signal on the Switch Matrix line is registered by an edge-triggered register within the Output Port. A clock source is required in this mode. An output enable (OE#) is available but not required.	<b>RO</b>
	<b>No Connect</b> – In this mode, the output Port pin is isolated from the Switch Matrix.	<b>NC</b>

## 1.1.2 Broadcast Mode

The OCX256 has a special Broadcast Mode which connects any input to all outputs without performance degradation. The input is selected using RapidConfigure or JTAG and disconnects all other inputs. The Global Update pin (UPDATE#) must be held high during Broadcast Mode. Asserting the UPDATE# pin returns the array to the previous program condition.

## 1.2 Output Buffer Configuration

Every output port of the OCX256 can be configured as either a flow-through or registered output. In registered mode there are two clock sources that are available:

- Global Clock
- Next Neighbor

Additionally, there are output control signals.

### 1.2.1 Output Control Signals

Every output port of the OCX has a global Output Enable signal (OE#). All output buffers have output enables that have programmable polarity and are individually configurable.

Additionally each output can be permanently enabled (always ON) or disabled (always OFF) which is useful for applications which need to tri-state outputs (for example when using multiple chips in expansion mode) or for power saving in designs that do not need to use all the outputs available.

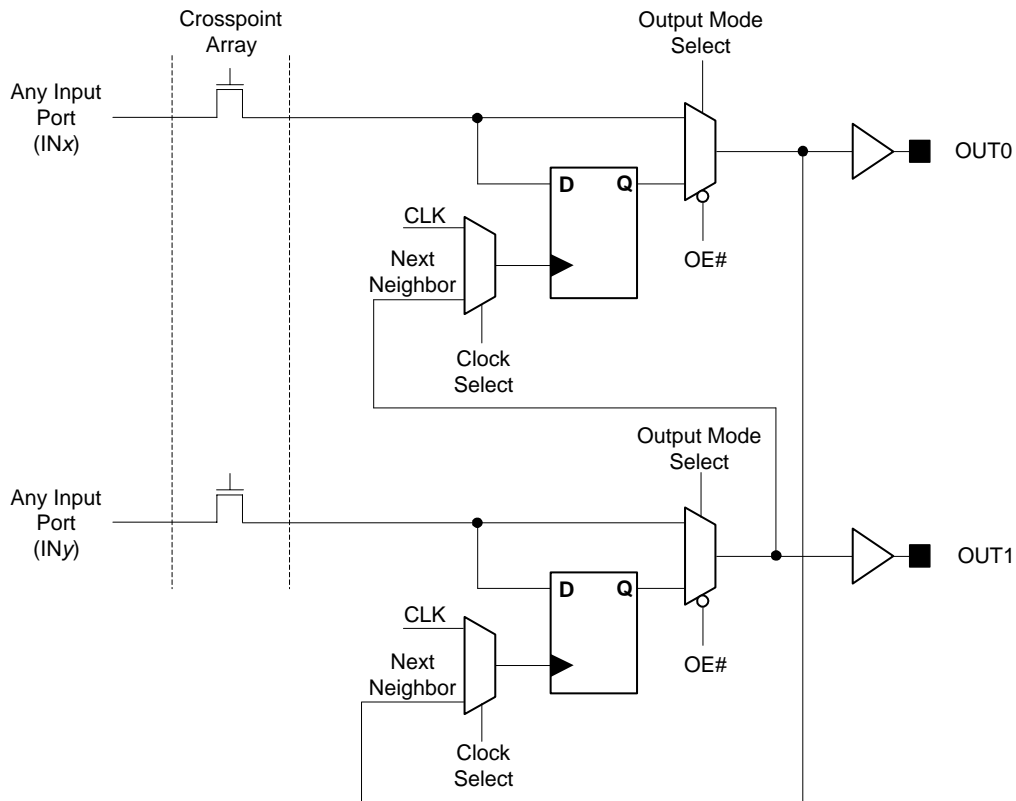

Two control bits are used to control the function of the output enable function as described in Table 5.

### 1.2.2 Neighboring Output Port as a Clock Source

A physically adjacent port can be used as a clock source for an output port configured in registered mode. These outputs are grouped in pairs such that the signal being switched through OUT0 can be used to clock the signal being switched through OUT1, and vice versa. Any single clock or data input signal can be used to clock any other input signal provided they are switched to an appropriate output pair (see Table 2). Figure 4 shows the implementation of next neighbor output port clocking in the OCX256 switch.

For example, IN<sub>x</sub> is used for data input while IN<sub>y</sub> is used for the corresponding clock. IN<sub>x</sub> is connected to OUT0 via the crosspoint array while IN<sub>y</sub> is connected to OUT1 via the crosspoint array. OUT0 is configured in registered output (RO) mode with OUT1 as its next neighbor clock selection. OUT1 will output the clock signal as well as clock the data in OUT0. Adjacent port selection is required for next neighbor clocking in the registered output mode.

This feature is useful in many applications where different types of data switching through the crosspoint array have various associated clocks. To match the delays in the data and corresponding clocks, it is common practice to pass the clocks through the switch along with the data.

**Figure 4** Next Neighbor Clock Block Diagram

The advantages of next neighbor clocking are:

1. Using next neighbor clocking in the registered output (RO) mode helps reduce the skew in outgoing data.
2. For a design with a large number of outputs switching simultaneously, next neighbor clocking mode is useful to stagger outputs for reduced board noise caused by simultaneous switching outputs.

**Note** – Selecting the next neighbor clock for both outputs at the same time is not recommended. Only one output in the pair at a time can be clocked by its next neighbor.

**Table 2** Next Neighbor Outputs

Pairing Sequence for Neighboring Outputs								
Output Next Neighbor Pairs	0,1	2,3	4,5	6,7	8,9	▶▶▶▶	124,125	126,127

Only OUT1 can neighbor with OUT0, OUT3 with OUT2, etc. OUT2 cannot neighbor with OUT1, or OUT4 with OUT3, etc.

## 1.3 RapidConfigure Interface

RapidConfigure (RC) is a 25 signal parallel interface that is used to program the OCX256 device. The 25 pins are allocated as follows:

RCA[6:0] = RapidConfigure Address A. RCA are input pins.

RCB[6:0] = RapidConfigure Address B. RCB are input pins.

RCI[3:0] = RapidConfigure Instruction Bits

RCO[4:0] = RapidConfigure Readback. RCO are output pins.

RC\_CLK# = RapidConfigure Clock

RC\_EN# = RapidConfigure Cycle Enable (state is sensed on negative edge of clock)

### 1.3.1 RapidConfigure Programming Instructions

The RC interface supports both write and read types of operations:

1. Write Operations (reset crosspoint and Input or Output Buffer (IOB), configure an Output Buffer, connect/disconnect crosspoint)
2. Read Operations (Output Buffer and crosspoint configuration read).

**Table 3 RapidConfigure Programming Instructions**

RCI[3:0]	RCA[6:0]	RCB[6:0]	RCO[4:0]	Instruction	Description
0000				Reserved	
0001				Reserved	
0010	X	X		Reset Crosspoint Array	Reset, along with an Update operation (UPDATE# pin or Update command), resets the entire crosspoint array to no connect. All Output Buffers remain unchanged by this operation.
0011	X	Input Port Address		Set Array to Broadcast mode	Connects the input selected by RCB[6:0] to all output ports and disconnects all other inputs. The Global Update (UPDATE#) pin must be held high during Broadcast mode. Activating the Global Update pin returns the array to the previous program condition.
0100	Output Port Address	Data		Configure an Output Buffer	Program an Output Buffer specified by RCA[6:0]. See Table 5 for RCB[6:0] bit assignment and buffer functionality.
0101				Readback Crosspoint, Output Buffer status	This is a two-cycle instruction.
<u>Cycle 1</u>	Output Port Address	Input Port Address	X		Specify the crosspoint connect status at output location specified by RCA[6:0] to the input location specified by RCB[6:0].

# OCX256 Crosspoint Switch—Advanced Datasheet

Table 3 RapidConfigure Programming Instructions (Continued)

RCI[3:0]	RCA[6:0]	RCB[6:0]	RCO[4:0]	Instruction	Description
<u>Cycle 2</u>	X	X	Output Data		Readback (using RCO[4:0]) the status of the output buffer specified in Cycle 1 by RCA[6:0], the output buffer specified in Cycle 1 by RCO[4:0] and the crosspoint connect status.  See Table 4 for RCO[4:0] readback pin assignment.
0110	X	X		Update	Program the Global Update function without the use of the UPDATE# pin.
0111	X	Input Port Address		Disconnect Input	Disconnect the crosspoint cells of the output row location specified by RCA[6:0].
1000	Output Port Address	Input Port Address		Disconnect Input and Output	Disconnect the crosspoint cell at the output location specified by RCA[6:0] to the input location specified by RCB[6:0].  All other connections from the source input address or to the same output address remain the same as before.
1001	Output Port Address	Input Port Address		Connect, with ImpliedDisconnect	Connect the crosspoint cell at the output location specified by RCA[6:0] to the input location specified by RCB[6:0].  All other connections from the same input address or to the same output address are set to no connect (NC).
1010	Output Port Address	Input Port Address		Connect, without ImpliedDisconnect	Connect the crosspoint cell at the output location specified by RCA[6:0] to the input location specified by RCB[6:0].  All other connections to the same output address are set to no connect while all other connections from the same input address remain the same as before.
1011				Reserved	
1100				Reserved	
1101	X	X		Reset All	Reset the switch matrix to no connects (NC). Update is forced internally. Sets the Output Buffer to Flow-through mode with Output Enabled.
1110				Reserved	
1111				Reserved	

**Note** – X = Don't care.

**Table 4 RCO[4:0] Readback Pin Assignment**

RCO[4:0]	Readback Location	Signal/Function
O4	Crosspoint	<b>Connection Status:</b> 0 = No connection (NC) — (default state at reset) 1 = Connected
O3	Output Buffer	<b>Clock Select:</b> 0 = Global Clock — (default state at reset) 1 = Next Neighbor
O2	Output Buffer	<b>Output Mode:</b> 0 = Flow-through (OP) — (default state at reset) 1 = Registered (RO)
O1, O0 0,0 0,1 1,0 1,1	Output Buffer	<b>Output Enable:</b> Output enabled (ON) – this is the default state at reset Output disabled (OFF) Output controlled by OE (active high) Output controlled by OE# (active low)

**Table 5 Programming an Output Buffer using RapidConfigure**

RCB[6:0]	Signal/Function
B6, B5, B4	Don't care
B3	<b>Clock Select:</b> 0 = Global Clock 1 = Next Neighbor
B2	<b>Output Mode:</b> 0 = Flow-through (OP) 1 = Registered (RO)
B1, B0 0,0 0,1 1,0 1,1	<b>Output Enable:</b> Output enabled (ON) – this is the default state at reset Output disabled (OFF) Output controlled by OE (active high) Output controlled by OE# (active low)

## 1.4 JTAG Configuration Controller

The Output port attributes and the Switch Matrix connections can be programmed using the JTAG serial bus. The RapidConfigure Interface can be enabled or disabled using the JTAG serial bus.

The JTAG-based serial mode is always available for configuration regardless of whether the RapidConfigure mode is enabled or disabled. However, proper care must be taken when switching between JTAG and RapidConfigure for configuring the devices. Before attempting to change Switch Matrix connections or output port configuration through JTAG, the user must first ensure that the RapidConfigure mode is disabled by using JTAG serial mode to set the RCE bit to zero in the Mode Control Register.

### 1.4.1 JTAG Interface

The dedicated JTAG TAP interface is designed in compliance with the IEEE-1149.1. The standard interface has five pins: Test Data Out (TDO), Test Mode Select (TMS), Test Data In (TDI), Test Reset (TRST#), and Test Clock (TCK), which allow Boundary Scan Testing as well as device configuration and verification. The Fairchild supplied software will automatically generate the necessary bitstream from a higher-level textual description of the required configuration. Data on the TDI and TMS pins are clocked into the device on the rising edge of the TCK signal, while the valid data appears on the TDO pin after the falling edge of TCK. For more detailed information on JTAG programming, refer to the *OCX Family Register Programming Manual*.

### 1.4.2 Output Port Configuration

Output port configuration is accomplished by loading the appropriate bitstream into the programming registers present at each Output port. The JTAG serial bus is used to load configuration data into the Output port programming registers, one Output port at a time.

### 1.4.3 Switch Matrix Configuration

The contents of the SRAM cells controlling Switch Matrix connection can be modified using the JTAG. This is accomplished by loading the configuration data, one word at a time, into the SRAM cells in the Switch Matrix.

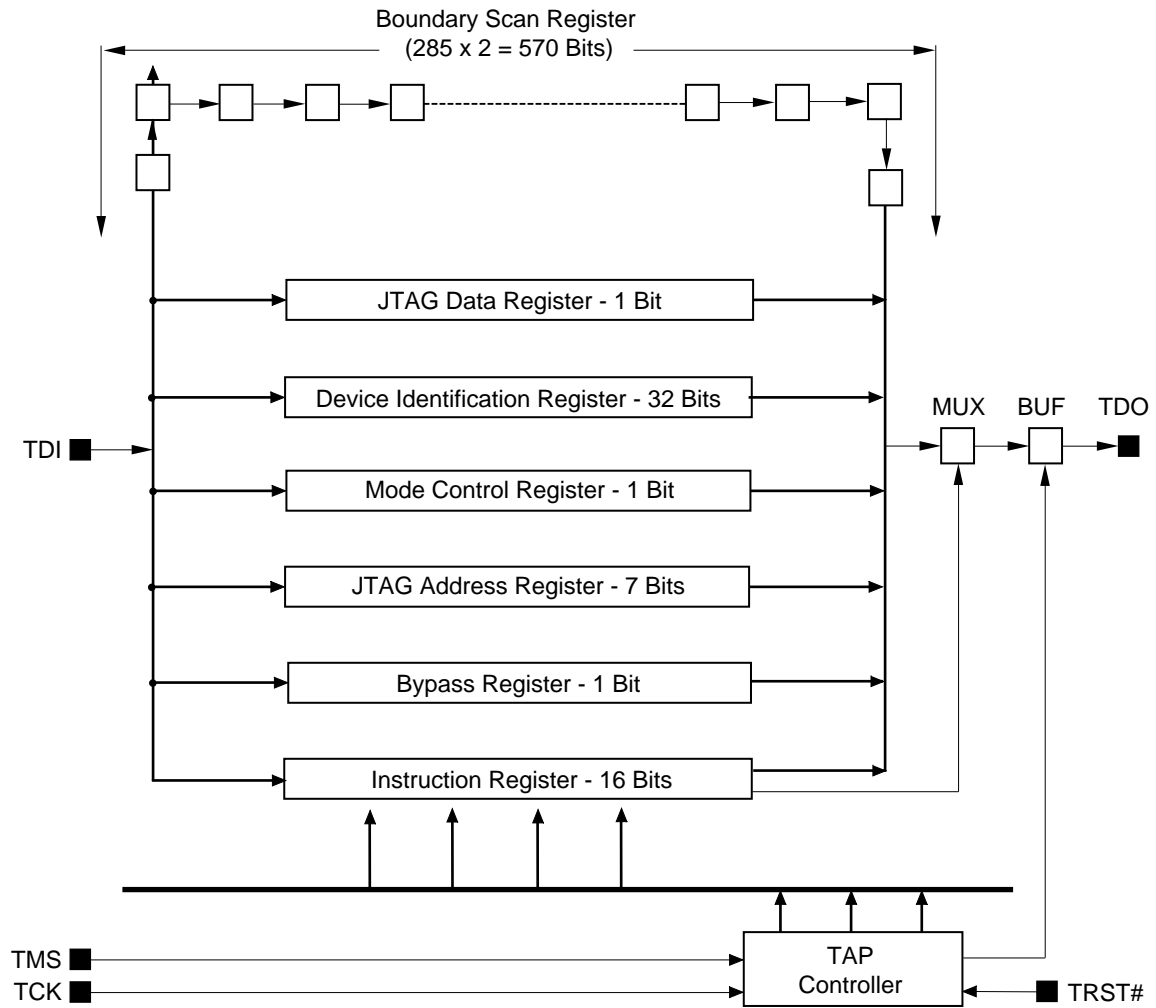

### 1.4.4 Mode Control Register Configuration

The OCX256 contains a single bit Mode Control Register used to store user flags for RapidConfigure Enable (RCE). These are required for proper functioning of the device. The contents of this register can be changed using the JTAG interface and a special JTAG instruction.

**Table 6 Mode Control Register**

RCE	Mode
0	RapidConfigure interface disabled (OFF)
1	RapidConfigure interface enabled (ON)

State of the RCE bit</li> </ol> <p>NOTE: This instruction does not increment the JTAG Address Register. This instruction also requires two DR cycles</p>
0 1 1 0	X	X	X	X	X	X	Update the Crosspoint Array	Update the programmed connection from the Loading SRAM to the Active SRAM.
0 1 1 1	X	X	X	X	X	X	Disconnect Input cell	Disconnect the Crosspoint connections from the Input address specified in the JTAG Address Register.

# OCX256 Crosspoint Switch—Advanced Datasheet

Table 8 JTAG Instructions (Continued)

I [3:0]	BB	BA	B9	B8	B7	A6-A0	Instruction	Description
1 0 0 0	X	X	X	X	X	Output Address	Disconnect Input and Output	Disconnect the Crosspoint cell at the Input location specified at the JTAG Address Register and the Output location specified in the Disconnect JTAG instruction (A6-A0). All other connections from the same input address or to the same output address remain the same.
1 0 0 1	X	X	X	X	X	Output Address	Connect with ImpliedDisconnect	Connects the Crosspoint cell at the Input location specified on the JTAG Address Register and the output location specified in the Connect JTAG instruction (A6-A0). All other connections from the same Input address or the same Output address are set to no-connects. NOTE: This instruction increments the JTAG Address Register (Input address).
1 0 1 0	X	X	X	X	X	Output Address	Connect—no ImpliedDisconnect	Connects the Crosspoint cell at the Input address specified in the JTAG Address Register and the Output address specified in the Connect JTAG instruction (A6-A0). All connections to the same output address are set to “no connect” while all other connections from the same input remain the same as before.
1 0 1 1	X	X	X	X	X	Input Address	Set the JTAG Address Register	Sets the 7-bit JTAG Address Register with the 7-bit address (A6-A0) of the JTAG Instruction Register. The 7-bit address of the JTAG Address Register becomes the Input port address for Crosspoint Access.
1 1 0 0	X	X	X	X	X	X	Device ID out	Serialize the device ID and revision history out to TDO. ID for the OCX256 is <b>0x0000C89F</b>
1 1 0 1	X	X	X	X	X	X	Reset Output Buffer and Crosspoint Array	Resets the Crosspoint Array to no-connects. Sets the Output buffer to Flow-through mode with Output Enabled. The device ID is serialized to TDO.
1 1 1 0	X	X	X	X	X	X	Set RCE Bit	Sets the RCE bit of the Mode Control Register with the JTAG instruction bit A0. To turn ON the RCE bit, encode bit A0 to 1. To turn OFF the RCE bit, encode bit A0 to 0.
1 1 1 1	X	X	X	X	X	X	Bypass	Places device in a mode to pass TDI data to TDO with one clock delay. Used for programming and testing devices through serial connected JTAG controls.

**Table 9 Programming an Output using JTAG**

BA, B9, B8, B7	Signal/Function
BA	<b>Clock Select:</b> 0 = Global Clock 1 = Next Neighbor
B9	<b>Output Mode:</b> 0 = Flow-through (OP) 1 = Registered (RO)
B8, B7 0,0 0,1 1,0 1,1	<b>Output Enable:</b> Output enabled (ON) – this is the default state at reset Output disabled (OFF) Output controlled by OE (active high) Output controlled by OE# (active low)

**Table 10 Number of JTAG Cycles and Configuration Time**

Operation	OCX256
	JTAG Cycles
JTAG Reset Sequence (TMS = “11111”)	7
Enable or Disable RapidConfigure	28
Change attributes of ONE Output Port	28
Change attributes of ALL Output Ports	3,584
Reset JTAG Controller + Reset ALL Output Ports + Clear ALL SRAM cells	35
Connect or disconnect two Ports	56
Configure Entire Switch Matrix	462,336
Completely Configure the Device (All Output Ports and All Switch Matrix Connections)	456,920

## 1.5 ImpliedDisconnect

ImpliedDisconnect is a feature that provides the ability to make fast switch connection changes. When using the instruction “Connect, without ImpliedDisconnect” all other connections to the specified output are set to “no connect”. However, the specified input remains connected to any output that it was connected to before.

When using the instruction “Connect, with ImpliedDisconnect” all connections from the specified input and to the specified output are set to “no connect”.

Thus, a connection change, i.e. breaking an existing connection and then making a new one, can be accomplished in one RapidConfigure cycle.

## 1.6 Device Reset Options

The power-on reset, RapidConfigure reset, hardware reset, and JTAG reset functions will program the output buffers to flow-through mode (with Global Clock selected), and Output Enabled (ON). JTAG can be reset via the TRST# pin or by clocking five consecutive one to the TMS pin. The hardware reset pin can be done accomplished through the HW\_RST# pin (active low). RC reset can be accomplished by applying the RC instruction 1101 to the RCI[3:0] pins.

**Table 11 Device Reset Options**

Programming Interface	Reset Method	Output Ports	Switch Matrix	RCE Mode Control	JTAG TAP
<b>Hardware Reset</b>	Power-on Reset	OP	NC	1 (RC Enabled)	TLR <sup>1</sup>
	HW_RST# (low pulse)	OP	NC	1 (RC Enabled)	TLR
<b>JTAG Reset</b>	1. Low Pulse on TRST#	Unchanged	Unchanged	Unchanged	TLR
	2. TMS high for 5 TCLK cycles	Unchanged	Unchanged	Unchanged	TLR
	3. Device Reset (instruction 1101)	OP	NC	1 (RC Enabled)	TLR

## 2. Pin Description

**Table 12 OCX256 Pin Description**

Pin Name	# of Pins	Type	Description
INPP[127:0]	128	Input	Non-inverting differential input signals
INN[127:0]	128	Input	Inverting differential input signals
OUTP[127:0]	128	Output	Non-inverting differential input signals
OUTN[127:0]	128	Output	Inverting differential input signals
CLKP	1	Input	Non-inverting differential Global Clock
CLKN	1	Input	Inverting differential Global Clock
OE#	1	Input	Global Output Enable
HW_RST#	1	Input	Hardware Reset
UPDATE#	1	Input	Global Update
<b>RC Pins</b>			
RCA[6:0]	7	Input	RapidConfigure Address A
RCB[6:0]	7	Input	RapidConfigure Address B
RCO[4:0]	5	Output	RapidConfigure Readback
RCI[3:0]	4	Input	RapidConfigure Instruction Bits
RC_CLK#	1	Input	RapidConfigure Clock
RC_EN#	1	Input	RapidConfigure Cycle Enable
<b>JTAG Pins</b>			
TCK	1	Input	JTAG Test Clock
TMS	1	Input	JTAG Test Mode Select
TDI	1	Input	JTAG Test Data In
TRST#	1	Input	JTAG Test Reset
TDO	1	Output	JTAG Test Data Out
<b>Power and Ground Pins</b>			
V <sub>DD</sub> -CORE	100	2.5V Power	Core Voltage
V <sub>DD</sub> -PAD <sup>(2)</sup>	15	2.5V or 3.3V Power	Differential Output Buffer Voltage
V <sub>DD</sub> -IN <sup>(1, 3)</sup>	16	3.3V Power	LVTTL Control pins Voltage and Differential Input Buffer Voltage
V <sub>SS</sub>	111	Ground	Ground

**NOTES:**

1. Dedicated differential input buffers can receive both LVDS and LVPECL voltage levels using 3.3V supply.
2. V<sub>DD</sub>-PAD is 2.5V for OCX256L or 3.3V for OCX256P.
3. The LVTTL control, JTAG pins, and differential input ports are 3.3V—they are not 5V tolerant.
4. The differential output pins powered from 2.5V are 3.3V tolerant.

## 3. Differential I/O Standards

The OCX256 supports the two most popular differential signaling standards: Low Voltage Differential Signaling (LVDS) and Low Voltage Positive Emitter Coupled Logic (LVPECL).

LVDS is typically used in communication systems as high speed, low noise point-to-point links. The OCX256 conforms to the ANSI/TIA/EIA-644 standard covering electrical specifications for output drivers and receiver inputs.

LVPECL is commonly used in video switching applications or those designs requiring transmission of high-speed clock signals.

### 3.1 LVDS

LVDS is a differential signaling standard. It requires that one data bit is carried through two signal lines. As with all differential signaling standards, LVDS has an inherent noise immunity over single-ended standards. The voltage swing between two signal lines is approximately 350mV. The use of a reference voltage or a board termination voltage is not required. LVDS requires the use of two pins per input or output. The OCX256L supports LVDS signalling. Integrated Output Attenuator resistors produce the required LVDS Output swing while providing a 100 ohm output impedance to minimize return reflections.

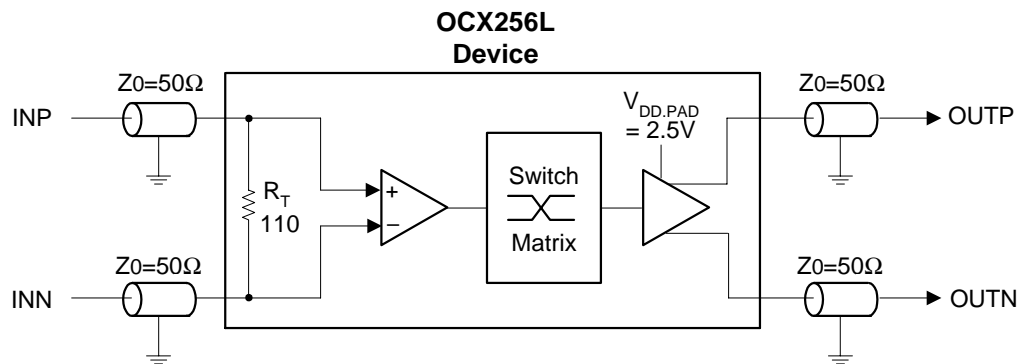

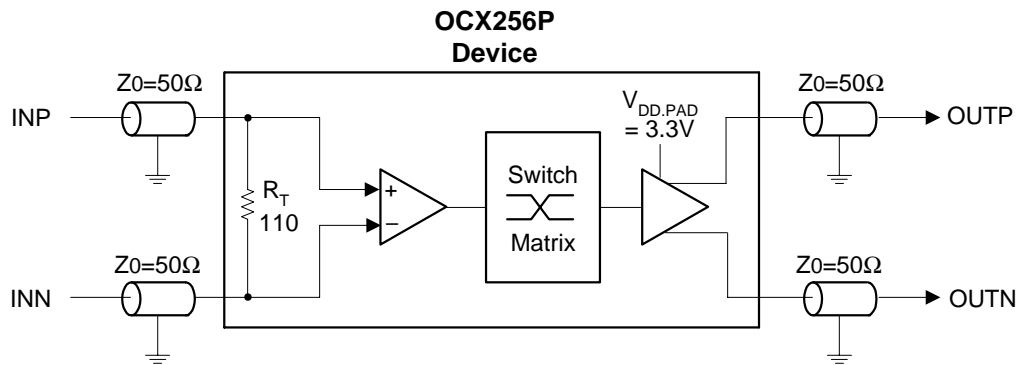

Figure 7 OCX256L LVDS Signal Circuit

## 3.2 LVPECL

LVPECL is another differential signaling standard that specifies two pins per input or output. The voltage swing between these two signal lines is approximately 850 mV. The use of a reference voltage or a board termination voltage is not required. The OCX256P supports LVPECL signalling. Integrated Output Attenuator resistors produce the required LVPECL Output swing while providing a 100 ohm output impedance to minimize return reflections.

**Figure 8** OCX256P LVPECL Signal Circuit

## 4. Electrical Specifications

### 4.1 Absolute Maximum Ratings

**Table 13 Absolute Maximum Ratings<sup>1</sup>**

Symbol	Parameter	Limits	Units
V <sub>DD-CORE</sub>	Supply Voltage (core)	-0.3 to +3.0	V
V <sub>DD-IN</sub>	Supply Voltage (inputs)	-0.3 to +3.6	V
V <sub>DD-PAD</sub>	Supply Voltage (differential outputs)	-0.3 to +3.6	V
V <sub>IN</sub> <sup>(2)</sup>	Input Voltage	-0.3 to +3.6 <sup>(3)</sup>	V
T <sub>J</sub>	Junction Temperature	+150	°C
T <sub>STG</sub>	Storage Temperature	-65 to +150	°C
P <sub>MAX</sub>	Maximum Power Dissipation	8.6	W
ESD <sup>(6)</sup>	Electrostatic Discharge	2000	V

### 4.2 Recommended Operating Conditions

**Table 14 Recommended Operating Conditions**

Symbol	Parameter	Limits	Units
V <sub>DD-CORE</sub>	Supply Voltage (core)	+2.375 to +2.625	V
V <sub>DD-PAD</sub> <sup>(4)</sup>	Supply Voltage (differential output buffers)	3.3V ±10% or 2.5V ±5%	V
V <sub>DD-IN</sub>	Supply Voltage (inputs)	+3.0 to +3.6	V
T <sub>A</sub>	Operating Temperature: Commercial Operating Temperature: Industrial	0 to +70 -40 to +85	°C

### 4.3 Pin Capacitance

**Table 15 Pin Capacitance<sup>5</sup>**

Symbol	Parameter	Max	Units
CPIN	Signal Pin Capacitance	10	pF

1. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.
2. A maximum undershoot of 2V for a maximum duration of 20 ns is acceptable. Overshoot to 3.6V is acceptable.
3. All inputs are 3.3V tolerant with the V<sub>DD</sub> pin at 2.5V or 3.3V.
4. Note that min and max values for V<sub>DD</sub> for differential outputs are I/O Standard dependent.
5. Capacitance measured at 25°C. Sample tested only.
6. Measured using Human Body Model.

## 4.4 DC Electrical Specifications

( $T_A = -40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ ,  $V_{DD,IN} = 3.3\text{V} \pm 10\%$ ,  $V_{DD,CORE} = 2.5\text{V} \pm 5\%$ )

**Table 16 LVTTL DC Electrical Specifications**

Symbol	Parameter	Conditions	Min	Max	Units
$V_{IH}$	High-level Input	Ports are 3.3V tolerant	2.0	3.6	V
$V_{IL}$	Low-level Input	Ports are 3.3V tolerant	-0.3	0.8	V
$V_{OH}$	High-level Output	$V_{DD,PAD} = \text{Min}$ $I_{OH} = -4\text{mA}$	2.4	$V_{DD,PAD} + 0.3$	V
$V_{OL}$	Low-level Output	$V_{DD,PAD} = \text{Min}$ $I_{OL} = 8\text{mA}$		0.4	V
$IL_{IH}, IL_{IL}^{(1)}$	Input Pin Leakage Current <sup>(2)</sup>	$V_{DD,IN} = \text{Max}$ $0.0 < I_n < V_{DD,PAD}$		+5 -50	$\mu\text{A}$
$IL_{OZ}$	Tristate Leakage Output OFF State <sup>(2)</sup>	$V_{DD,PAD} = \text{Max}$ $0.0 < I_n < V_{DD,PAD}$		+5 -5	$\mu\text{A}$
<b>Power</b>					
$P_{DDQ}^{(3)}$	Quiescent Power	All $V_{DD} = \text{Max}$		0.7	W

**Table 17 OCX256L (LVDS) DC Electrical Specifications ( $V_{DD,PAD} = 2.5\text{V}$ )**

DC Parameter	Min	Typ	Max	Units
Output High Voltage for OUTP and OUTN			1.6	V
Output Low Voltage for OUTP and OUTN	0.90			V
Differential Output Voltage <sup>(4)</sup>	$\pm 250$	$\pm 350$	$\pm 450$	mV
Output Common-Mode Voltage	1.125	1.25	1.375	V
Differential Input Voltage	$\pm 100$	$\pm 350$		mV
Input Common-Mode Voltage	0.25	1.25	2.25	V
$Z_{IN}$ — Termination Impedance	88		132	$\Omega$

1. All LVTTL input pins have pull-up resistors.
2. Input leakage only valid when both positive and negative inputs/outputs area equal (i.e. both high or both low)
3. See section 6 for dynamic power consumption calculation.
4. Maximum capacitive load is 12 pF.

**Table 18 OCX256P (LVPECL) DC Electrical Specifications ( $V_{DD,PAD} = 3.3\text{V}$ )**

Symbol	DC Parameters	Min	Max	Units
$V_{IN\_DIFF}$	Input Differential Voltage	$\pm 100$		mV
$V_{IN\_COM}$	Input Common Mode Voltage	0.25	2.25	V
$V_{OUT\_DIFF}$	Output Differential Voltage	$\pm 350$	$\pm 650$	mV
$V_{OUT\_COM}$	Output Common Mode Voltage	$\frac{V_{DD,PAD}}{2}$	$\frac{V_{DD,PAD}}{2}$	V
$Z_{IN}$	Termination Impedance	80	120	$\Omega$

The  $V_{OH}$  levels are 200mV below LVPECL levels and are compatible with devices tolerant of lower common-mode ranges. The above table summarizes the DC output specifications of LVPECL.

## 5.4 Package Dimensions

**NOTE**

1. DIMENSIONS AND TOLERANCE PER ASME Y 14.5M - 1994
- △ DIMENSION IS MEASURED AT THE MAXIMUM SOLDER BALL DIAMETER PARALLEL TO PRIMARY DATUM C
- △ PRIMARY DATUM C AND SEATING PLANE ARE DEFINED BY THE SPHERICAL CROWNS OF THE SOLDER BALLS.
4. SOLDER BALL POSITION DESIGNATION PER JESD 95-1.
- △ THE ENCAPSULATION SIZE (X,Y) WILL VARY WITH CAVITY SIZE. THE DISTANCE FROM BOND FINGER EDGE TO ENCAPSULATION SHALL BE MIN. 0.50MM.
6. UNLESS OTHERWISE SPECIFIED TOLERANCE : DECIMAL  $\pm 0.05$   
ANGULAR  $\pm 2^\circ$ .

**Figure 18 OCX256 Package—Bottom View**

**Figure 19 OCX256 Package—Top and Side Views**

## 5.5 Package Thermal Characteristics

Table 22 Package Thermal Coefficients

Package	Pin Count	$\Theta_{JC}(C/W)$	$\Theta_{JA}(^{\circ}C/W)$ Still Air
TBGA	792	0.4	7.58°C/W

**NOTE:**

1. Thermal performance values are based on simulation data.

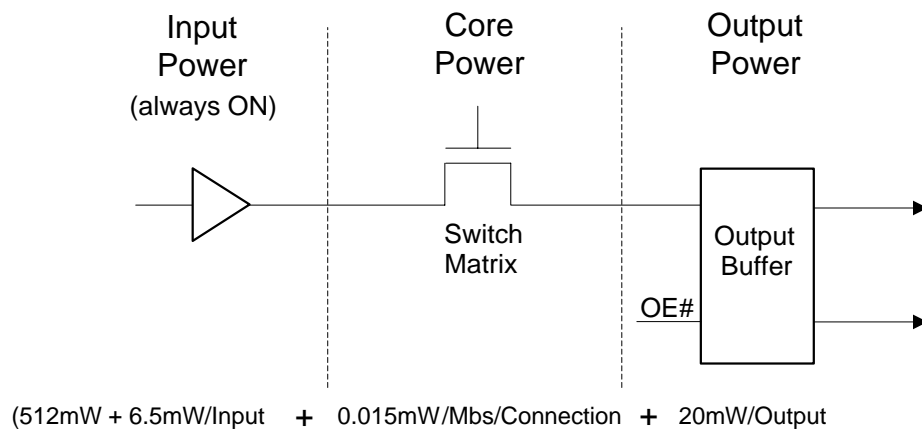

## 6. Power Consumption

Chip power consists of three integral elements (refer to Figure 20):

1. **Input Power**—This element has two components:
  - a steady state component that is always ON, and
  - a component that is based on the number of inputs being used.
2. **Core Power**—Core power is a function of data rate (Mb/s) and the number of connection paths through the switch matrix.
3. **Output Power**—This element is a fixed amount for each differential output. The value is zero if the Output Enable (OE#) is disabled or set to OFF.

The following diagram shows the chip power elements (as described above), the formulas used for determining chip power, and the total power consumption as determined by the formula.

### 6.1 Power for OCX256L (LVDS)

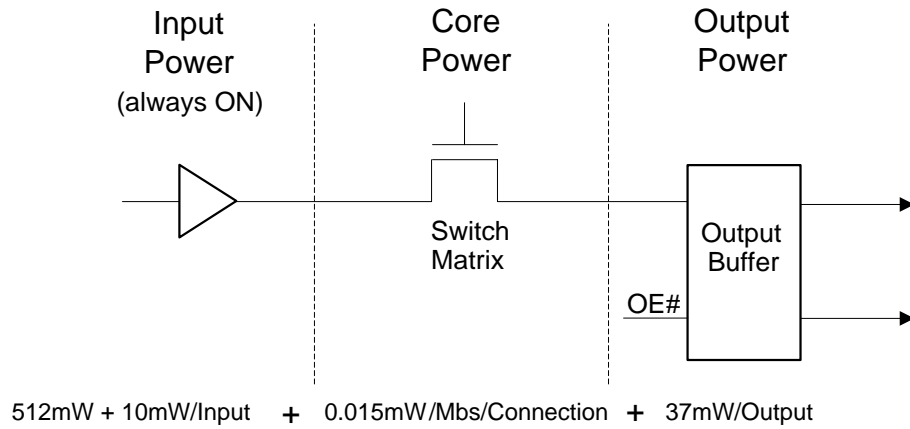

**Example:** Worst Case = (512mW + 832mW) + (0.015 mW x 667 x 128) + (20mW x 128)

$$\begin{aligned}
 &1344\text{mW} \quad + \quad 1280\text{mW} \quad + \quad 2560\text{mW} \\
 &= \mathbf{5.18 \text{ watts}}
 \end{aligned}$$

**Figure 20 Power Consumption Diagram for the OCX256L using LVDS**

## 6.2 Power for OCX256P (LVPECL)

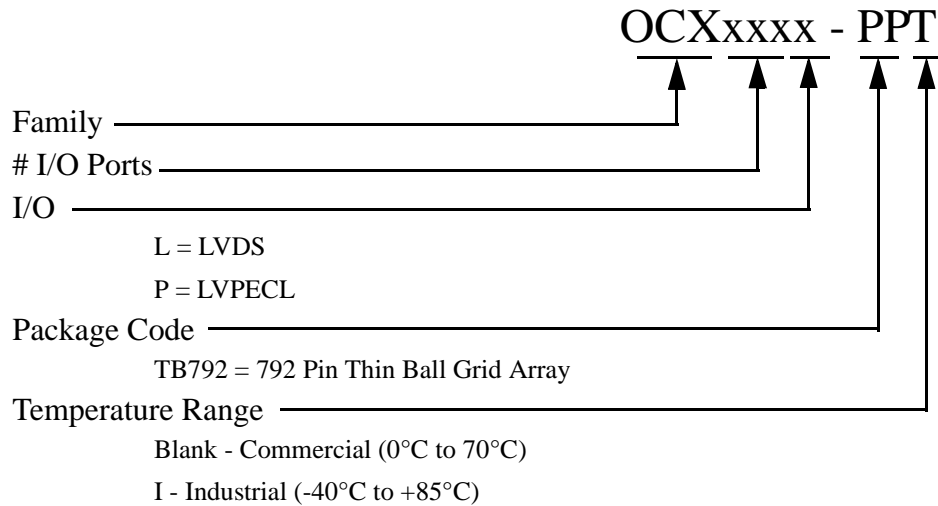

**Example:** Worst Case =  $(512\text{mW} + 1280\text{mW}) + (0.015 \text{ mW} \times 667 \times 128) + (37\text{mW} \times 128)$

$$1792\text{mW} + 1280\text{mW} + 4736\text{mW} = 7.81 \text{ watts}$$

**Figure 21 Power Consumption Diagram for the OCX256P using LVPECL**

## 7. Component Availability and Ordering Information

---

## 8. Glossary

---

**CLOCK:** A single differential input used to gate data into registers in the Output Buffer. The input serves all outputs of the OCX. The neighbor input can also be used as a register clock.

**CROSSPOINT:** A single cell controlled by two RAM bits. The RAM bits are connected in a master-slave configuration to provide an update for programming and changing program information all at once.

**CROSSPOINT ARRAY:** An array of Crosspoint cells used to connect any input port to any output port.

**INPUT OR OUTPUT PATH:** The signal flow from pin to array and array to pin. Each path has a register with selectable clocks, drivers for the loaded outputs with selectable enables, and sense circuits to detect changes on either side of the IO Buffer.

**NEXT NEIGHBOR:** A physically adjacent port can be used as a clock source for an output configured in registered mode. These outputs are grouped in pairs such that the signal being switched through Output 0 can be used to clock the signal being switched through Output 1, or vice-versa. Any single clock or data input signal can be used to clock any other input signal provided they are switched to an appropriate output pair.

**PORT:** A name followed by a number to identify a pin on the device.

**RAPIDCONFIGURE:** A parallel programming method for the OCX devices. The RC mode uses 25 dedicated pins to program the Crosspoint Array and the IO Buffers. The 25 pins consist of an enable, a clock, four instruction bits, two seven-bit address fields, and a five-bit data field.

## Revision History

Date	Version No.	Description														
9/25/2000	Revision 1.0	Preliminary release of “Advanced” datasheet														
10/8/00	Revision 1.1	Additions include RCO output pin information, pinout drawing, pinout tables, package dimensions and illustration, duty-cycle diagram, thermal characteristics table, device reset options table, a section on configuring multiple devices, bitstream generation and downloading, JTAG information, and Power Consumption information/illustrations.														
11/1/00	Revision 1.2	Corrections made to pinout drawing and pin names.														
11/16/00	Revision 1.3	Updated RapidConfigure Read Cycle timing diagram so that RCO is relative to RC_CLK#; RCO was previously relative to RC_EN#. Replaced “+” on signal names to “P” and “-” to “N”. Corrected RCO[4:0] pin locations.														
11/21/00	Revision 1.4	Corrected pin names ENAB, RCC, and RCE on Pinout drawing and tables to be OE#, RC_CLK#, and RC_EN# respectively; corrections to Input and Output pin names 59P, 60P, 61P, and 62P in tables 22 and 23.														
1/12/01	Revision 1.5	Corrected pin names in Table 22 “Pinout By Ball Sequence”: <table border="0"> <thead> <tr> <th><u>From</u></th> <th><u>To</u></th> </tr> </thead> <tbody> <tr> <td>B32 OUT58P</td> <td>B32 OUT59P</td> </tr> <tr> <td>C33 OUT60P</td> <td>C33 OUT61P</td> </tr> <tr> <td>D32 OUT59P</td> <td>D32 OUT60P</td> </tr> <tr> <td>D33 OUT61P</td> <td>D33 OUT62P</td> </tr> <tr> <td>AR9 OUT120P</td> <td>AR9 OUT120N</td> </tr> <tr> <td>AT9 OUT120N</td> <td>AT9 OUT120P</td> </tr> </tbody> </table>	<u>From</u>	<u>To</u>	B32 OUT58P	B32 OUT59P	C33 OUT60P	C33 OUT61P	D32 OUT59P	D32 OUT60P	D33 OUT61P	D33 OUT62P	AR9 OUT120P	AR9 OUT120N	AT9 OUT120N	AT9 OUT120P
<u>From</u>	<u>To</u>															
B32 OUT58P	B32 OUT59P															
C33 OUT60P	C33 OUT61P															
D32 OUT59P	D32 OUT60P															
D33 OUT61P	D33 OUT62P															
AR9 OUT120P	AR9 OUT120N															
AT9 OUT120N	AT9 OUT120P															
2/20/01	Revision 1.6	Reversed “input” and “output” descriptions in Table 3 “RapidConfigure Programming Instructions” for instructions 0101, 0111, 1000, 1001, and 1010. Corrected pin names in Table 22 “Pinout By Ball Sequence”: <table border="0"> <thead> <tr> <th><u>From</u></th> <th><u>To</u></th> </tr> </thead> <tbody> <tr> <td>K5 IN119N</td> <td>K5 IN119P</td> </tr> <tr> <td>K6 IN119P</td> <td>K6 IN119N</td> </tr> <tr> <td>AM38 IN597P</td> <td>AM38 IN59P</td> </tr> <tr> <td>AU9 OUT119P</td> <td>AU9 OUT119N</td> </tr> <tr> <td>AV9 OUT119N</td> <td>AV9 OUT119P</td> </tr> </tbody> </table> <p>Changed the <math>V_{IH}</math>, <math>V_{IL}</math>, <math>V_{OH}</math>, and <math>V_{OL}</math> minimum and maximum values for LVPECL DC specifications in Table 20; added a note below table explaining the current values; changed Pass Transistor to high-performance buffering circuit; updated power and ground pin count in Table 12.</p>	<u>From</u>	<u>To</u>	K5 IN119N	K5 IN119P	K6 IN119P	K6 IN119N	AM38 IN597P	AM38 IN59P	AU9 OUT119P	AU9 OUT119N	AV9 OUT119N	AV9 OUT119P		
<u>From</u>	<u>To</u>															
K5 IN119N	K5 IN119P															
K6 IN119P	K6 IN119N															
AM38 IN597P	AM38 IN59P															
AU9 OUT119P	AU9 OUT119N															
AV9 OUT119N	AV9 OUT119P															
4/5/01	Revision 1.7	Created separate parts for LVDS and LVPECL (OCX256L and OCX256P respectively); created new LVDS and LVPECL signal drawings; created new LVDS and LVPECL power consumption drawings; updated DC electrical specifications tables; changes/corrections to LVDS and LVPECL DC Electrical Specs tables.														
5/21/2001	Revision 1.8	Changes to LVDS and LVPECL power consumption diagrams and Input power specs.														
7/27/01	Revision 1.9	Changes to LVDS and LVPECL DC Electrical specs tables; added termination impedance values														
9/14/01	Revision 1.10	Added jitter specifications and PRBS Data Eye diagram.														
10/26/01	Revision 2.0	Swapped Ball Name(s) OUT*P to OUT*N on pinout drawing and tables—Ball Numbers remain the same.														

## 9. Product Status Definition

Datasheet Identification	Product Status	Definition
<b>Advanced</b>	Formative or In Design	This datasheet contains the design specifications for product development. Specification may change in any manner without notice.
<b>Preliminary</b>	Preproduction Product	This datasheet contains the preliminary data, and supplementary data will be published at a later date. Fairchild reserves the right to make changes at any time without notice in order to improve design and supply the best possible product.
<b>No Identification</b>	Full Production	This datasheet contains final specifications. Fairchild reserves the right to make changes at any time without notice in order to improve design and supply the best possible product.
<b>Obsolete</b>	No longer in Production	This datasheet contains specifications for a product that has been discontinued by Fairchild. The datasheet is provided for reference information only.

Fairchild does not assume any responsibility for use of any circuitry described, no circuit patent licenses are implied and Fairchild reserves the right at any time without notice to change said circuitry and specifications.

### LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATIONS. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety of effectiveness.
