- When using the products covered herein, please observe the conditions written herein and the precautions outlined in the following paragraphs. In no event shall the company be liable for any damages resulting from failure to strictly adhere to these conditions and precautions.
 - (1) The products covered herein are designed and manufactured for the following application areas. When using the products covered herein for the equipment listed in Paragraph (2), even for the following application areas, be sure to observe the precautions given in Paragraph (2). Never use the products for the equipment listed in Paragraph (3).
 - Office electronics
 - Instrumentation and measuring equipment
 - Machine tools
 - Audiovisual equipment
 - Home appliance
 - Communication equipment other than for trunk lines
 - (2) Those contemplating using the products covered herein for the following equipment which demands high reliability, should first contact a sales representative of the company and then accept responsibility for incorporating into the design fail-safe operation, redundancy, and other appropriate measures for ensuring reliability and safety of the equipment and the overall system.
 - Control and safety devices for airplanes, trains, automobiles, and other transportation equipment
 - Mainframe computers
 - Traffic control systems
 - Gas leak detectors and automatic cutoff devices
 - Rescue and security equipment
 - Other safety devices and safety equipment, etc.
 - (3) Do not use the products covered herein for the following equipment which demands extremely high performance in terms of functionality, reliability, or accuracy.
 - Aerospace equipment
 - Communications equipment for trunk lines
 - Control equipment for the nuclear power industry
 - Medical equipment related to life support, etc.
 - (4) Please direct all queries and comments regarding the interpretation of the above three Paragraphs to a sales representative of the company.
- Please direct all queries regarding the products covered herein to a sales representative of the company.

1. Description

The LRS1383 is a combination memory organized as 2,097,152 x16 bit flash memory and 524,288 x16 bit static RAM in one package.

Features

- Power supply •••• 2.7V to 3.3V
- Operating temperature •••• -25°C to +85°C
- Not designed or rated as radiation hardened
- 72pin CSP (LCSP072-P-0811) plastic package
- Flash memory has P-type bulk silicon, and SRAM has P-type bulk silicon

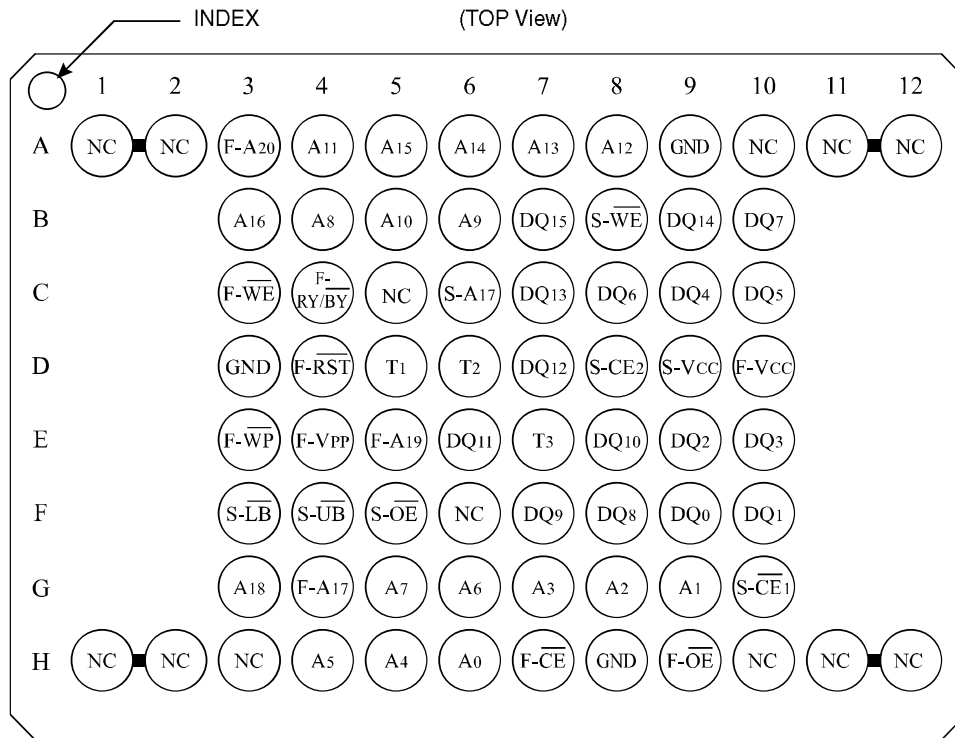

Flash Memory

- Access Time •••• 85 ns (Max.)
- Power supply current (The current for F-V_{CC} pin and F-V_{PP} pin)
 - Read •••• 25 mA (Max. t_{CYCLE} = 200ns, CMOS Input)
 - Word write •••• 60 mA (Max.)
 - Block erase •••• 30 mA (Max.)
 - Reset Power-Down •••• 25 μA (Max. F- $\overline{\text{RST}}$ = GND ± 0.2V, I_{OUT} (F-RY/ $\overline{\text{BY}}$) = 0mA)
 - Standby •••• 25 μA (Max. F- $\overline{\text{CE}}$ = F- $\overline{\text{RST}}$ = F-V_{CC} ± 0.2V)
- Optimized Array Blocking Architecture
 - Eight 4K-word Parameter Blocks
 - Sixty-Three 32K-word Main Blocks
 - Bottom Parameter Location
- Extended Cycling Capability
 - 100,000 Block Erase Cycles (F-V_{PP} = 1.65V to 3.3V)
 - 1,000 Block Erase Cycles and total 80 hours (F-V_{PP} = 11.7V to 12.3V)
- Enhanced Automated Suspend Options
 - Word Write Suspend to Read
 - Block Erase Suspend to Word Write
 - Block Erase Suspend to Read

SRAM

- Access Time •••• 70 ns (Max.)
- Power Supply current
 - Operating current •••• 50 mA (Max. t_{RC}, t_{WC} = Min.)
 - 8 mA (Max. t_{RC}, t_{WC} = 1μs, CMOS Input)
 - Standby current •••• 25 μA (Max.)
 - Data retention current •••• 25 μA (Max. S-V_{CC} = 3.0V)

2. Pin Configuration

Note) From T1 to T3 pins are needed to be open.
 Two NC pins at the corner are connected.
 Do not float any GND pins.

Pin	Description	Type

Standby	Standby	5	H	H	X	X	(8)		X	X	(8)		High-Z	
Reset Power Down	Standby	5,6	X	L										

Notes:

- L = V_{IL}, H = V_{IH}, X = H or L, High-Z = High impedance. Refer to the DC Characteristics.
- Command writes involving block erase, (page buffer) program are reliably executed when F-V_{PP} = V_{PPH1/2} and F-V_{CC} = 2.7V to 3.3V.
Command writes involving full chip erase is reliably executed when F-V_{PP} = V_{PPH1} and F-V_{CC} = 2.7V to 3.3V.
Block erase, full chip erase, (page buffer) program with F-V_{PP} < V_{PPH1/2} (Min.) produce spurious results and should not be attempted.
- Never hold F- \overline{OE} low and F- \overline{WE} low at the same timing.
- Refer Section 5. Command Definitions for Flash Memory valid D_{IN} during a write operation.
- F- \overline{WP} set to V_{IL} or V_{IH}.
- Electricity consumption of Flash Memory is lowest when F-R \overline{ST} = GND ±0.2V.

3.2 Simultaneous Operation Modes Allowed with Four Planes^(1, 2)

IF ONE PARTITION IS:	THEN THE MODES ALLOWED IN THE OTHER PARTITION IS:									
	Read Array	Read ID	Read Status	Read Query	Word Program	Page Buffer Program	Block Erase	Full Chip Erase	Program Suspend	Block Erase Suspend
Read Array	X	X	X	X	X	X	X		X	X
Read ID	X	X	X	X	X	X	X		X	X
Read Status	X	X	X	X	X	X	X	X	X	X

Block Erase	X	X	X	X						
Full Chip Erase			X							
Program Suspend	X	X	X	X						X
Block Erase Suspend	X	X	X	X	X	X			X	

Notes:

1. "X" denotes the operation available.
2. Configurative Partition Dual Work Restrictions:
 Status register reflects partition state, not WSM (Write State Machine) state - this allows a status register for each partition.
 Only one partition can be erased or programmed at a time - no command queuing.
 Commands must be written to an address within the block targeted by that command.

Set Partition Configuration Register	2	2,3	Write	PCRC	60H	Write	PCRC	04H

Notes:

- Bus operations are defined in 3.1 Bus Operation.
- The address which is written at the first bus cycle should be the same as the address which is written at the second bus cycle.
X=Any valid address within the device.
PA=Address within the selected partition.
IA=Identifier codes address (See 5.2 Identifier Codes for Read Operation).
QA=Query codes address. Refer to the LH28F320BF, LH28F640BF series Appendix for details.
BA=Address within the block being erased, set/cleared block lock bit or set block lock-down bit.
WA=Address of memory location for the Program command or the first address for the Page Buffer Program command.
PCRC=Partition configuration register code presented on the address A₀-A₁₅.
- ID=Data read from identifier codes (See 5.2 Identifier Codes for Read Operation).
QD=Data read from query database. Refer to the LH28F320BF, LH28F640BF series Appendix for details.
SRD=Data read from status register. See 6. Status Register Definition for a description of the status register bits.
WD=Data to be programmed at location WA. Data is latched on the rising edge of F-WE or F-CE (whichever goes high first).
N-1=N is the number of the words to be loaded into a page buffer.
- Following the Read Identifier Codes command, read operations access manufacturer code, device code, block lock configuration code, partition configuration register code (See 5.2 Identifier Codes for Read Operation).
The Read Query command is available for reading CFI (Common Flash Interface) information.
- Block erase, full chip erase or (page buffer) program cannot be executed when the selected block is locked. Unlocked block can be erased or programmed when F-RST is V_{IH}.
- Either 40H or 10H are recognized by the CUI (Command User Interface) as the program setup.
- Following the third bus cycle, inputs the program sequential address and write data of "N" times. Finally, input the any valid address within the target partition to be programmed and the confirm command (D0H). Refer to the LH28F320BF, LH28F640BF series Appendix for details.

8. If the program operation in one partition is suspended and the erase operation in other partition is also suspended, the suspended program operation should be resumed first, and then the suspended erase operation should be resumed next.
9. Full chip erase operation can not be suspended.
10. Following the Clear Block Lock Bit command, block which is not locked-down is unlocked when $F\text{-}\overline{WP}$ is V_{IL} .
When $F\text{-}\overline{WP}$ is V_{IH} , lock-down bit is disabled and the selected block is unlocked regardless of lock-down configuration.
11. Commands other than those shown above are reserved by SHARP for future device implementations and should not be used.

5.2 Identifier Codes for Read Operation

	Code	Address [A ₁₅ -A ₀] ⁽⁴⁾	Data [DQ ₁₅ -DQ ₀]	Notes
Manufacturer Code	Manufacturer Code	0000H	00B0H	
Device Code	32M Bottom Parameter Device Code	0001H	00B5H	1
Block Lock Configuration Code	Block is Unlocked	Block Address + 2	DQ ₀ = 0	2
	Block is Locked		DQ ₀ = 1	2
	Block is not Locked-Down		DQ ₁ = 0	2
	Block is Locked-Down		DQ ₁ = 1	2
Device Configuration Code	Partition Configuration Register	0006H	PCRC	3

Notes:

1. Bottom parameter device has its parameter blocks in the plane 0 (The lowest address).
2. DQ₁₅-DQ₂ is reserved for future implementation.
3. PCRC=Partition Configuration Register Code.
4. The address A₂₀-A₁₆ are shown in below table for reading the manufacturer, device, lock configuration, device configuration code.
The address to read the identifier codes is dependent on the partition which is selected when writing the Read Identifier Codes command (90H).
See Chapter 6. Partition Configuration Register Definition (P.15) for the partition configuration register.

Identifier Codes for Read Operation on Partition Configuration (32M-bit device)

Partition Configuration Register			Address (32M-bit device) [A ₂₀ -A ₁₆]
PCR.10	PCR.9	PCR.8	
0	0	0	00H
0	0	1	00H or 08H
0	1	0	00H or 10H
1	0	0	00H or 18H
0	1	1	00H or 08H or 10H
1	1	0	00H or 10H or 18H
1	0	1	00H or 08H or 18H
1	1	1	00H or 08H or 10H or 18H

5.3 Functions of Block Lock and Block Lock-Down

Current State					Erase/Program Allowed ⁽²⁾
State	F- \overline{WP}	DQ ₁ ⁽¹⁾	DQ ₀ ⁽¹⁾	State Name	
[000]	0	0	0	Unlocked	Yes
[001] ⁽³⁾	0	0	1	Locked	No
[011]	0	1	1	Locked-down	No
[100]	1	0	0	Unlocked	Yes
[101] ⁽³⁾	1	0	1	Locked	No
[110] ⁽⁴⁾	1	1	0	Lock-down Disable	Yes
[111]	1	1	1	Lock-down Disable	No

Notes:

- DQ₀ = 1: a block is locked; DQ₀ = 0: a block is unlocked.
DQ₁ = 1: a block is locked-down; DQ₁ = 0: a block is not locked-down.
- Erase and program are general terms, respectively, to express: block erase, full chip erase and (page buffer) program operations.
- At power-up or device reset, all blocks default to locked state and are not locked-down, that is, [001] (F- \overline{WP} = 0) or [101] (F- \overline{WP} = 1), regardless of the states before power-off or reset operation.
- When F- \overline{WP} is driven to V_{IL} in [110] state, the state changes to [011] and the blocks are automatically locked.

5.4 Block Locking State Transitions upon Command Write⁽⁴⁾

Current State				Result after Lock Command Written (Next State)		
State	F- \overline{WP}	DQ ₁	DQ ₀	Set Lock ⁽¹⁾	Clear Lock ⁽¹⁾	Set Lock-down ⁽¹⁾
[000]	0	0	0	[001]	No Change	[011] ⁽²⁾
[001]	0	0	1	No Change ⁽³⁾	[000]	[011]
[011]	0	1	1	No Change	No Change	No Change
[100]	1	0	0	[101]	No Change	[111] ⁽²⁾
[101]	1	0	1	No Change	[100]	[111]
[110]	1	1	0	[111]	No Change	[111] ⁽²⁾
[111]	1	1	1	No Change	[110]	No Change

Notes:

- “Set Lock” means Set Block Lock Bit command, “Clear Lock” means Clear Block Lock Bit command and “Set Lock-down” means Set Block Lock-Down Bit command.
- When the Set Block Lock-Down Bit command is written to the unlocked block (DQ₀ = 0), the corresponding block is locked-down and automatically locked at the same time.
- “No Change” means that the state remains unchanged after the command written.
- In this state transitions table, assumes that F- \overline{WP} is not changed and fixed V_{IL} or V_{IH}.

5.5 Block Locking State Transitions upon $\overline{F\text{-}\overline{WP}}$ Transition⁽⁴⁾

Previous State	Current State				Result after $\overline{F\text{-}\overline{WP}}$ Transition (Next State)	
	State	$\overline{F\text{-}\overline{WP}}$	DQ ₁	DQ ₀	$\overline{F\text{-}\overline{WP}} = 0 \rightarrow 1$ ⁽¹⁾	$\overline{F\text{-}\overline{WP}} = 1 \rightarrow 0$ ⁽¹⁾
-	[000]	0	0	0	[100]	-
-	[001]	0	0	1	[101]	-
[110] ⁽²⁾	[011]	0	1	1	[110]	-
Other than [110] ⁽²⁾					[111]	-
-	[100]	1	0	0	-	[000]
-	[101]	1	0	1	-	[001]
-	[110]	1	1	0	-	[011] ⁽³⁾
-	[111]	1	1	1	-	[011]

Notes:

1. " $\overline{F\text{-}\overline{WP}} = 0 \rightarrow 1$ " means that $\overline{F\text{-}\overline{WP}}$ is driven to V_{IH} and " $\overline{F\text{-}\overline{WP}} = 1 \rightarrow 0$ " means that $\overline{F\text{-}\overline{WP}}$ is driven to V_{IL} .
2. State transition from the current state [011] to the next state depends on the previous state.
3. When $\overline{F\text{-}\overline{WP}}$ is driven to V_{IL} in [110] state, the state changes to [011] and the blocks are automatically locked.
4. In this state transitions table, assumes that lock configuration commands are not written in previous, current and next state.

T_{STG}	Storage temperature		-55 to +125	°C
F- V_{PP}	F- V_{PP} voltage	1,3,5	-0.2 to +12.6	V

Notes:

1. The maximum applicable voltage on any pins with respect to GND.
2. Except F- V_{PP} .
3. -2.0V undershoot and $V_{CC} + 2.0V$ overshoot are allowed when the pulse width is less than 20 nsec.
4. V_{IN} should not be over $V_{CC} + 0.3V$.
5. Applying 12V $\pm 0.3V$ to F- V_{PP} during erase/write can only be done for a maximum of 1000 cycles on each block. F- V_{PP} may be connected to 12V $\pm 0.3V$ for total of 80 hours maximum. +12.6V overshoot is allowed when the pulse width is less than 20 nsec.

V _{LKO}	F-V _{CC} Lockout Voltage		1.5			V	

Notes:

- V_{CC} includes both F-V_{CC} and S-V_{CC}.
- All currents are in RMS unless otherwise noted. Typical values are the reference values at V_{CC} = 3.0V and T_A=+25°C unless V_{CC} is specified.
- I_{CCWS} and I_{CCES} are specified with the device de-selected. If read or (page buffer) program while in block erase suspend mode, the device's current draw is the sum of I_{CCWS} or I_{CCES} and I_{CCR} or I_{CCW} respectively.
- Block erase, full chip erase, (page buffer) program are inhibited when F-V_{PP} ≤ V_{PPLK}, and not guaranteed in the range between V_{PPLK} (max.) and V_{PPH1} (min.) , between V_{PPH1} (max.) and V_{PPH2} (min.) and above V_{PPH2} (max.).
- The Automatic Power Savings (APS) feature automatically places the device in power save mode after read cycle completion. Standard address access timings (t_{AVQV}) provide new data when addresses are changed.
- Sampled, not 100% tested.
- F-V_{PP} is not used for power supply pin. With F-V_{PP} ≤ V_{PPLK}, block erase, full chip erase, (page buffer) program cannot be executed and should not be attempted.
Applying 12V ±0.3V to F-V_{PP} provides fast erasing or fast programming mode. In this mode, F-V_{PP} is power supply pin and supplies the memory cell current for block erasing and (page buffer) programming. Use similar power supply trace widths and layout considerations given to the V_{CC} power bus.
Applying 12V ±0.3V to F-V_{PP} during erase/program can only be done for a maximum of 1000 cycles on each block. F-V_{PP} may be connected to 12V ±0.3V for a total of 80 hours maximum.
- The operating current in dual work is the sum of the operating current (read, erase, program) in each plane.

t _{WHRL} (t _{EHRL})	F- \overline{WE} (F- \overline{CE}) High to F-RY/ \overline{BY} Going Low	3		100	ns

Notes:

1. The timing characteristics for reading the status register during block erase, full chip erase, (page buffer) program operations are the same as during read-only operations. See the AC Characteristics for read cycle.
2. A write operation can be initiated and terminated with either F- \overline{CE} or F- \overline{WE} .
3. Sampled, not 100% tested.
4. Write pulse width (t_{WP}) is defined from the falling edge of F- \overline{CE} or F- \overline{WE} (whichever goes low last) to the rising edge of F- \overline{CE} or F- \overline{WE} (whichever goes high first). Hence, t_{WP}=t_{WLWH}=t_{ELEH}=t_{WLEH}=t_{ELWH}.
5. Write pulse width high (t_{WPH}) is defined from the rising edge of F- \overline{CE} or F- \overline{WE} (whichever goes high first) to the falling edge of F- \overline{CE} or F- \overline{WE} (whichever goes low last). Hence, t_{WPH}=t_{WHWL}=t_{EHEL}=t_{WHEL}=t_{EHWL}.
6. F-V_{PP} should be held at F-V_{PP}=V_{PPH1/2} until determination of block erase, (page buffer) program success (SR.1/3/4/5=0) and held at F-V_{PP}=V_{PPH1} until determination of full chip erase success (SR.1/3/5=0).
7. t_{WHR0} (t_{EHR0}) after the Read Query or Read Identifier Codes command=t_{AVQV}+100ns.
8. See 5.1 Command Definitions for valid address and data for block erase, full chip erase, (page buffer) program or lock bit configuration.

t _{ERES}	Latency Time from Block Erase Resume Command to Block Erase Suspend Command	5	-	500			500			μs

Notes:

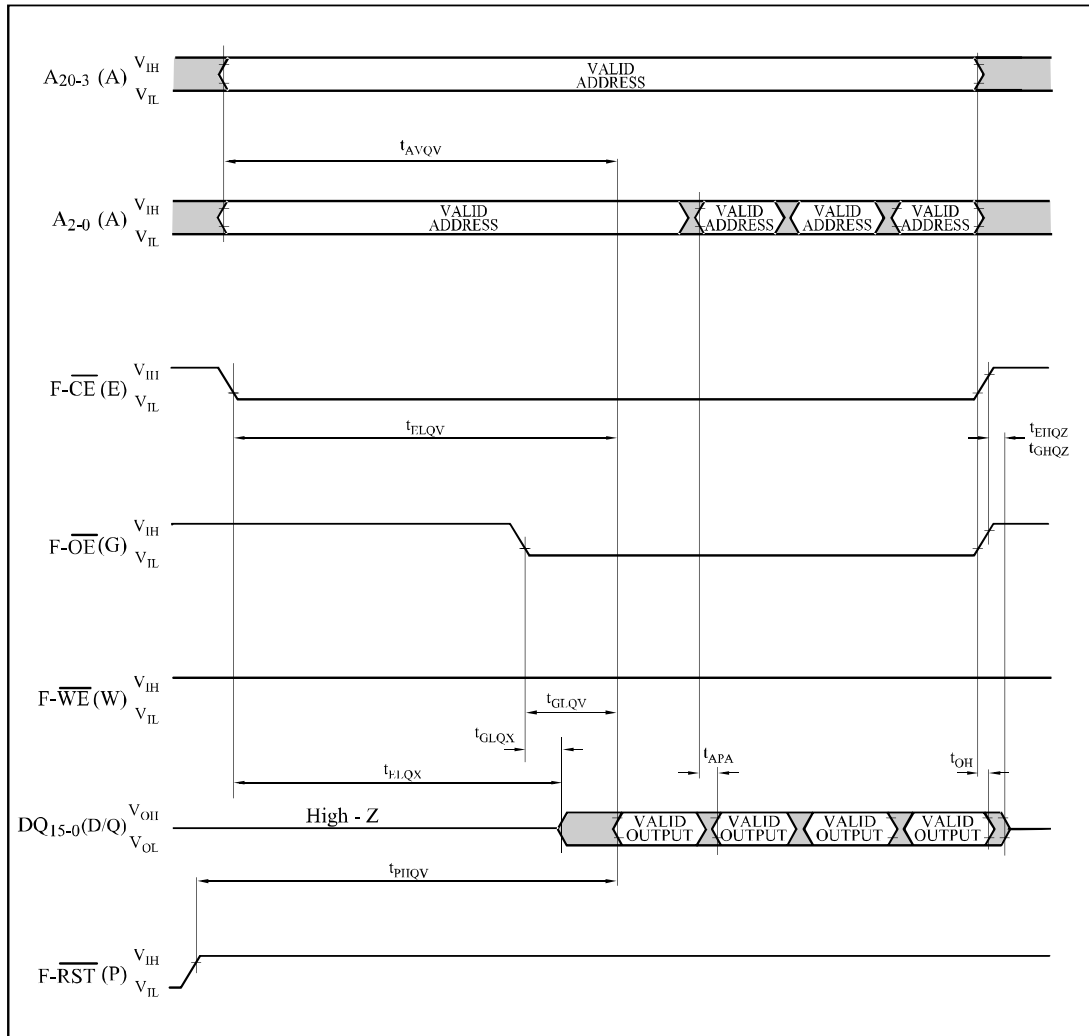

1. Typical values measured at F-V_{CC} = 3.0V, F-V_{pp} = 3.0V or 12V, and T_A = +25°C. Assumes corresponding lock bits are not set. Subject to change based on device characterization.
2. Excludes external system-level overhead.
3. Sampled, but not 100% tested.
4. A latency time is required from writing suspend command (F- \overline{WE} or F- \overline{CE} going high) until SR.7 going "1" or F-RY/ \overline{BY} going High-Z.
5. If the interval time from a Block Erase Resume command to a subsequent Block Erase Suspend command is shorter than t_{ERES} and its sequence is repeated, the block erase operation may not be finished.

Notes:

1. A reset time, t_{PHQP} , is required from the later of SR.7 ($\overline{\text{F-RY/BY}}$) going "1" (High-Z) or $\overline{\text{F-RST}}$ going high until outputs are valid. See the AC Characteristics - read cycle for t_{PHQP} .
2. t_{PLPH} is <100ns the device may still reset but this is not guaranteed.
3. Sampled, not 100% tested.
4. If $\overline{\text{F-RST}}$ asserted while a block erase, full chip erase or (page buffer) program operation is not executing, the reset will complete within 100ns.
5. When the device power-up, holding $\overline{\text{F-RST}}$ low minimum 100ns is required after $F\text{-}V_{CC}$ has been in predefined range and also has been in stable there.

13.4 SRAM AC Characteristics Timing Chart

Read Cycle Timing Chart

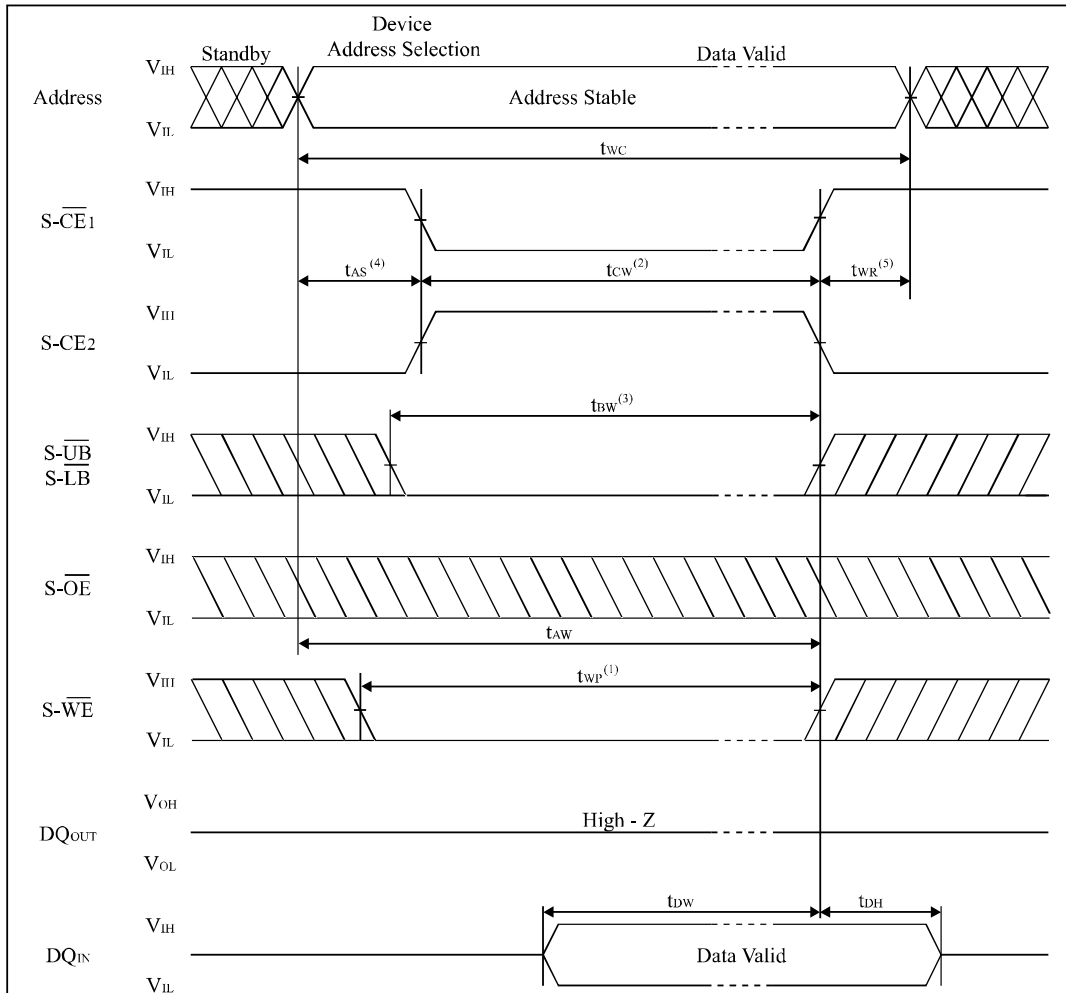

Write Cycle Timing Chart (S-WE Controlled)

Notes:

1. A write occurs during the overlap of a low S-CE₁, a high S-CE₂ and a low S-WE.
 A write begins at the latest transition among S-CE₁ going low, S-CE₂ going high and S-WE going low.
 A write ends at the earliest transition among S-CE₁ going high, S-CE₂ going low and S-WE going high.
 t_{WP} is measured from the beginning of write to the end of write.
2. t_{CW} is measured from the later of S-CE₁ going low or S-CE₂ going high to the end of write.
3. t_{BW} is measured from the time of going low S-UB or low S-LB to the end of write.
4. t_{AS} is measured from the address valid to beginning of write.
5. t_{WR} is measured from the end of write to the address change. t_{WR} applies in case a write ends at S-CE₁ going high, S-CE₂ going low or S-WE going high.
6. During this period DQ pins are in the output state, therefore the input signals of opposite phase to the outputs must not be applied.
7. If S-CE₁ goes low or S-CE₂ goes high simultaneously with S-WE going low or after S-WE going low, the outputs remain in high impedance state.
8. If S-CE₁ goes high or S-CE₂ goes low simultaneously with S-WE going high or before S-WE going high, the outputs remain in high impedance state.

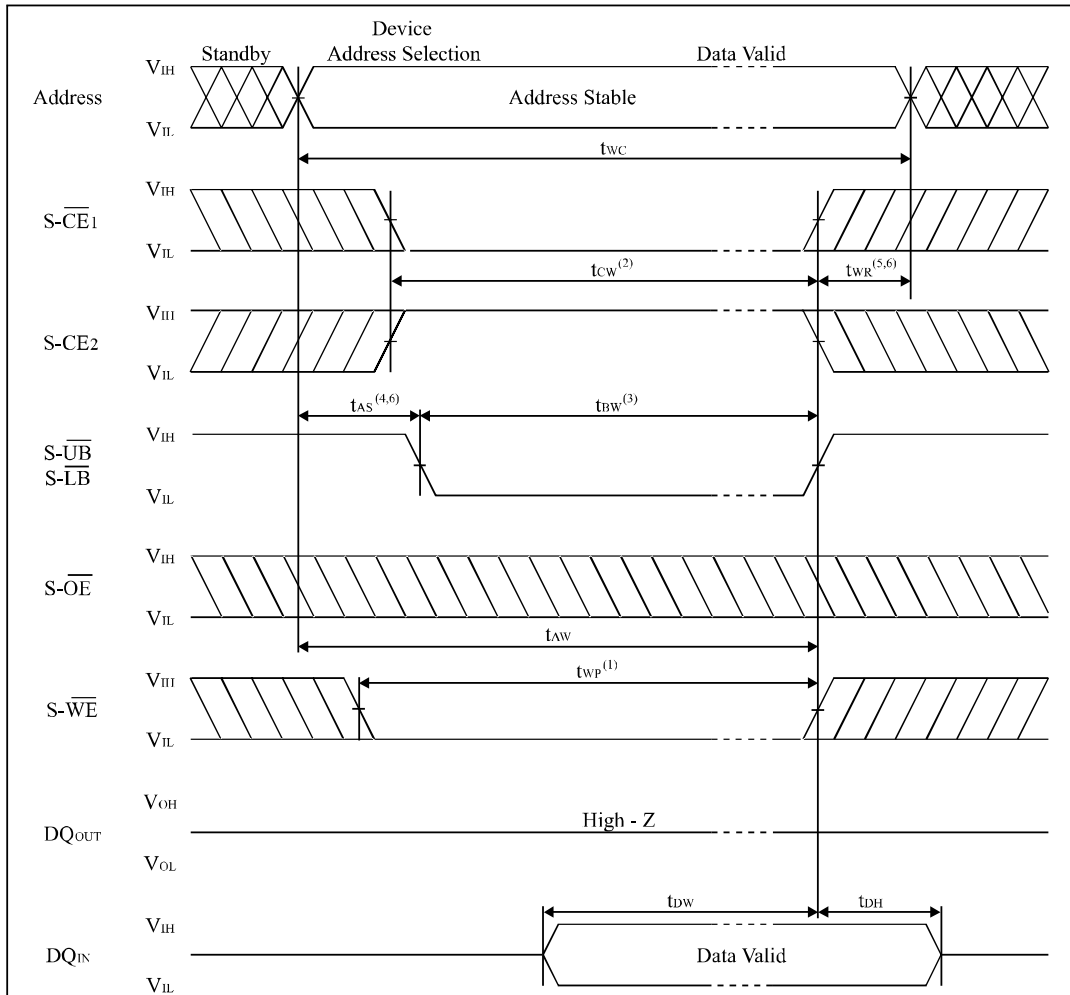

Write Cycle Timing Chart (S- \overline{CE} Controlled)

Notes:

1. A write occurs during the overlap of a low S- \overline{CE} 1, a high S-CE2 and a low S- \overline{WE} .
 A write begins at the latest transition among S- \overline{CE} 1 going low, S-CE2 going high and S- \overline{WE} going low.
 A write ends at the earliest transition among S- \overline{CE} 1 going high, S-CE2 going low and S- \overline{WE} going high.
 t_{WP} is measured from the beginning of write to the end of write.
2. t_{CW} is measured from the later of S- \overline{CE} 1 going low or S-CE2 going high to the end of write.
3. t_{BW} is measured from the time of going low S- \overline{UB} or low S-LB to the end of write.
4. t_{AS} is measured from the address valid to beginning of write.
5. t_{WR} is measured from the end of write to the address change. t_{WR} applies in case a write ends at S- \overline{CE} 1 going high, S-CE2 going low or S- \overline{WE} going high.

Notes:

1. A write occurs during the overlap of a low S-CE₁, a high S-CE₂ and a low S-WE.
 A write begins at the latest transition among S-CE₁ going low, S-CE₂ going high and S-WE going low.
 A write ends at the earliest transition among S-CE₁ going high, S-CE₂ going low and S-WE going high.
 t_{WP} is measured from the beginning of write to the end of write.
2. t_{CW} is measured from the later of S-CE₁ going low or S-CE₂ going high to the end of write.
3. t_{BW} is measured from the time of going low S-UB or low S-LB to the end of write.
4. t_{AS} is measured from the address valid to beginning of write.
5. t_{WR} is measured from the end of write to the address change. t_{WR} applies in case a write ends at S-CE₁ going high, S-CE₂ going low or S-WE going high.
6. S-UB and S-LB need to make the time of start of a cycle, and an end "high" level for reservation of t_{AS} and t_{WR}.

14. Data Retention Characteristics for SRAM

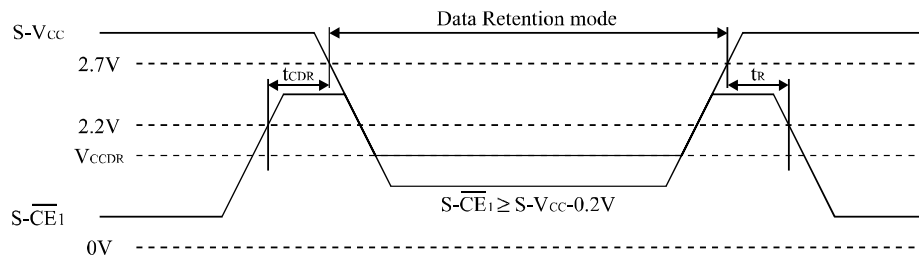

($T_A = -25^{\circ}\text{C}$ to $+85^{\circ}\text{C}$)

Symbol	Parameter	Note	Min.	Typ. ⁽¹⁾	Max.	Unit	Conditions

15. Notes

This product is a stacked CSP package that a 32M (x16) bit Flash Memory and a 8M (x16) bit SRAM are assembled into.

- Supply Power

Maximum difference (between F-V_{CC} and S-V_{CC}) of the voltage is less than 0.3V.

- Power Supply and Chip Enable of Flash Memory and SRAM (F- $\overline{\text{CE}}$, S- $\overline{\text{CE}}_1$, S-CE₂)

S- $\overline{\text{CE}}_1$ should not be "low" and S-CE₂ should not be "high" when F- $\overline{\text{CE}}$ is "low" simultaneously.

If the two memories are active together, possibly they may not operate normally by interference noises or data collision on DQ bus.

Both F-V_{CC} and S-V_{CC} are needed to be applied by the recommended supply voltage at the same time expect SRAM data retention mode.

- Power Up Sequence

When turning on Flash memory power supply, keep F- $\overline{\text{RST}}$ "low". After F-V_{CC} reaches over 2.7V, keep F- $\overline{\text{RST}}$ "low" for more than 100 nsec.

- Device Decoupling

The power supply is needed to be designed carefully because one of the SRAM and the Flash Memory is in standby mode when the other is active. A careful decoupling of power supplies is necessary between SRAM and Flash Memory. Note peak current caused by transition of control signals (F- $\overline{\text{CE}}$, S- $\overline{\text{CE}}_1$, S-CE₂).

16. Flash Memory Data Protection

Noises having a level exceeding the limit specified in the specification may be generated under specific operating conditions on some systems. Such noises, when induced onto $\overline{F\text{-WE}}$ signal or power supply, may be interpreted as false commands and causes undesired memory updating. To protect the data stored in the flash memory against unwanted writing, systems operating with the flash memory should have the following write protect designs, as appropriate:

■ The below describes data protection method.

1. Protection of data in each block

- Any locked block by setting its block lock bit is protected against the data alternation. When $\overline{F\text{-WP}}$ is low, any locked-down block by setting its block lock-down bit is protected from lock status changes.
By using this function, areas can be defined, for example, program area (locked blocks), and data area (unlocked blocks).
- For detailed block locking scheme, see Chapter 5.Command Definitions for Flash Memory.

2. Protection of data with $F\text{-V}_{pp}$ control

- When the level of $F\text{-V}_{pp}$ is lower than V_{ppLK} ($F\text{-V}_{pp}$ lockout voltage), write functions to all blocks are disabled. All blocks are locked and the data in the blocks are completely protected.

3. Protection of data with $\overline{F\text{-RST}}$

- Especially during power transitions such as power-up and power-down, the flash memory enters reset mode by bringing $\overline{F\text{-RST}}$ to low, which inhibits write operation to all blocks.
- For detailed description on $\overline{F\text{-RST}}$ control, see Chapter 12.6 AC Electrical Characteristics for Flash Memory, Reset Operations.

■ Protection against noises on $\overline{F\text{-WE}}$ signal

To prevent the recognition of false commands as write commands, system designer should consider the method for reducing noises on $\overline{F\text{-WE}}$ signal.

17. Design Considerations

1. Power Supply Decoupling

To avoid a bad effect to the system by flash memory power switching characteristics, each device should have a 0.1μF ceramic capacitor connected between its F-V_{CC} and GND and between its F-V_{PP} and GND.

Low inductance capacitors should be placed as close as possible to package leads.

2. F-V_{PP} Trace on Printed Circuit Boards

Updating the memory contents of flash memories that reside in the target system requires that the printed circuit board designer pay attention to the F-V_{PP} Power Supply trace. Use similar trace widths and layout considerations given to the F-V_{CC} power bus.

3. The Inhibition of Overwrite Operation

Please do not execute reprogramming “0” for the bit which has already been programed “0”. Overwrite operation may generate unerasable bit.

In case of reprogramming “0” to the data which has been programed “1”.

- Program “0” for the bit in which you want to change data from “1” to “0”.
- Program “1” for the bit which has already been programed “0”.

For example, changing data from “1011110110111101” to “1010110110111100” requires “111011111111110” programing.

4. Power Supply

Block erase, full chip erase, word write with an invalid F-V_{PP} (See Chapter 11. DC Electrical Characteristics) produce spurious results and should not be attempted.

Device operations at invalid F-V_{CC} voltage (See Chapter 11. DC Electrical Characteristics) produce spurious results and should not be attempted.

19 Package and packing specification

1.Storage Conditions.

1-1.Storage conditions required before opening the dry packing.

- Normal temperature : 5~40°C
- Normal humidity : 80% R.H. max.

1-2.Storage conditions required after opening the dry packing.

In order to prevent moisture absorption after opening, ensure the following storage conditions apply:

- (1) Storage conditions for one-time soldering. (Convection reflow*1, IR/Convection reflow.*1)
 - Temperature : 5~25°C
 - Humidity : 60% R.H. max.
 - Period : 96 hours max. after opening.
- (2) Storage conditions for two-time soldering. (Convection reflow*1, IR/Convection reflow.*1)
 - a. Storage conditions following opening and prior to performing the 1st reflow.
 - Temperature : 5~25°C.
 - Humidity : 60% R.H. max.
 - Period : 96 hours max. after opening.
 - b. Storage conditions following completion of the 1st reflow and prior to performing the 2nd reflow.
 - Temperature : 5~25°C.
 - Humidity : 60% R.H. max.
 - Period : 96 hours max. after completion of the 1st reflow.

*1:Air or nitrogen environment.

1-3.Temporary storage after opening.

To re-store the devices before soldering, do so only once and use a dry box or place desiccant (with a blue humidity indicator) with the devices and perform dry packing again using heat-sealing.

The storage period, temperature and humidity must be as follows :

(1) Storage temperature and humidity.

※1 : External atmosphere temperature and humidity of the dry packing.

(2) Storage period.

- X1 + X2 : Refer to Section 1-2(1) and (2)a , depending on the mounting method.
- Y : Two weeks max.

2. Baking Condition.

- (1) Situations requiring baking before mounting.
 - Storage conditions exceed the limits specified in Section 1-2 or 1-3.
 - Humidity indicator in the desiccant was already red (pink) when opened.
(Also for re-opening.)
- (2) Recommended baking conditions.
 - Baking temperature and period :
120+10/-0°C for 1~3 hours.
 - The above baking conditions apply since the trays are heat-resistant.
- (3) Storage after baking.
 - After baking, store the devices in the environment specified in Section 1-2 and mount immediately.

3. Surface mount conditions.

The following soldering condition are recommended to ensure device quality.

3-1. Soldering.

- (1) Convection reflow or IR/Convection. (one-time soldering or two-time soldering in air or nitrogen environment)
 - Temperature and period :
Peak temperature of 240°C max., above 230°C for 15 sec. max.
Above 200°C for 30~50 sec.
Preheat temperature of 140~160°C for 90±30 sec.
Temperature increase rate of 1~3°C/sec.
 - Measuring point : IC package surface.
 - Temperature profile :

4. Condition for removal of residual flux.

- (1) Ultrasonic washing power : 25 watts / liter max.
- (2) Washing time : Total 1 minute max.
- (3) Solvent temperature : 15~40°C

5. Package outline specification.

Due to the different manufacturing process, there are tow types of package outline. (see *1)
 No changes are planned on package structure, substrate, and quality or reliability level remains unchanges. Refer to the attached drawing.

6. Markings.

6-1. Marking details. (The information on the package should be given as follows.)

- (1) Product name : LRS1383
- (2) Company name : S
- (3) Date code

(Example) YY WW XXX

A-1 RECOMMENDED OPERATING CONDITIONS

A-1.1 At Device Power-Up

AC timing illustrated in Figure A-1 is recommended for the supply voltages and the control signals at device power-up. If the timing in the figure is ignored, the device may not operate correctly.

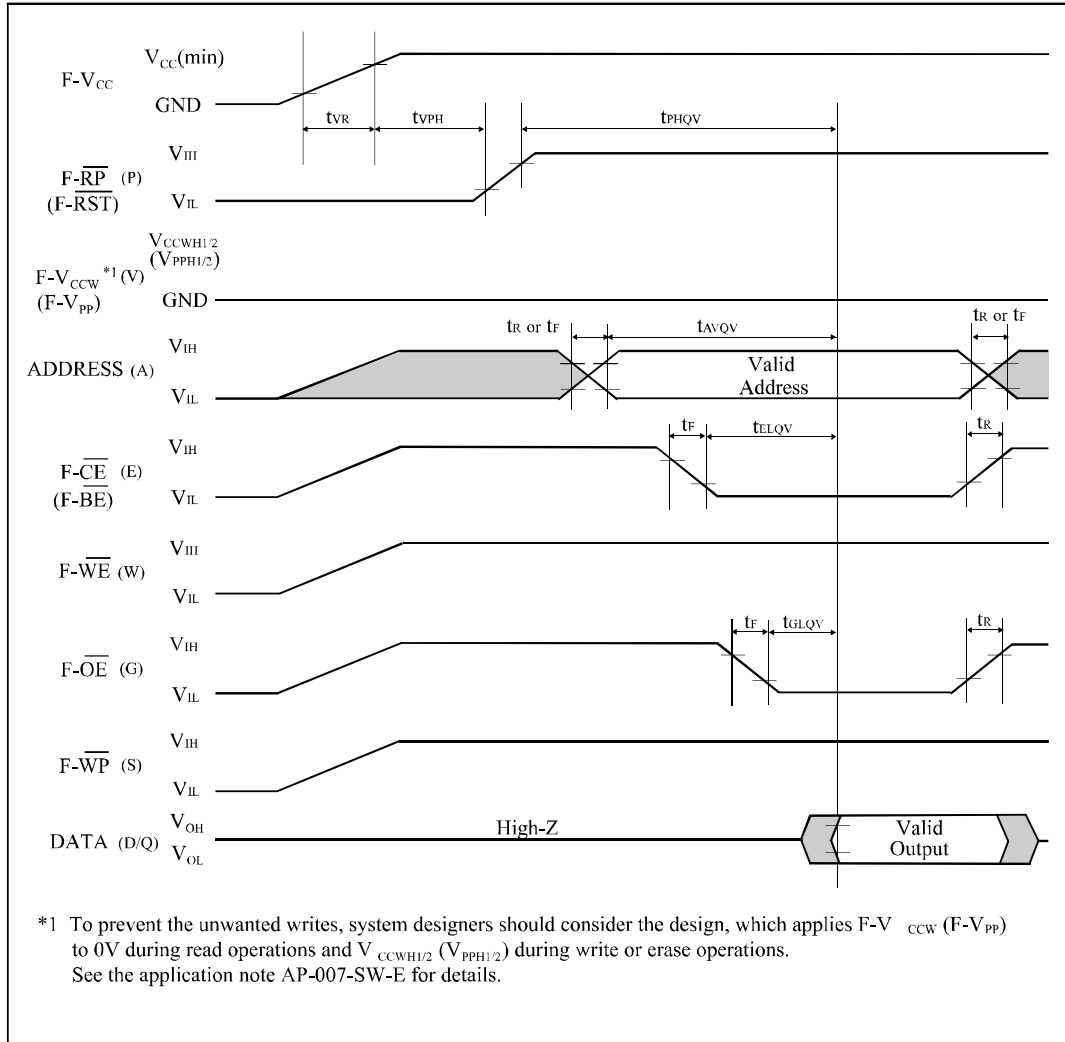

Figure A-1. AC Timing at Device Power-Up

For the AC specifications t_{vR} , t_r , t_f in the figure, refer to the next page. See the “AC Electrical Characteristics for Flash Memory” described in specifications for the supply voltage range, the operating temperature and the AC specifications not shown in the next page.

A-1.1.1 Rise and Fall Time

Symbol	Parameter	Notes	Min.	Max.	Unit
t_{VR}	F- V_{CC} Rise Time	1	0.5	30000	$\mu\text{s}/\text{V}$
t_R	Input Signal Rise Time	1, 2		1	$\mu\text{s}/\text{V}$
t_F	Input Signal Fall Time	1, 2		1	$\mu\text{s}/\text{V}$

NOTES:

1. Sampled, not 100% tested.
2. This specification is applied for not only the device power-up but also the normal operations.

A-1.2 Glitch Noises

Do not input the glitch noises which are below $V_{IH}(\text{Min.})$ or above $V_{IL}(\text{Max.})$ on address, data, reset, and control signals, as shown in Figure A-2 (b). The acceptable glitch noises are illustrated in Figure A-2 (a).

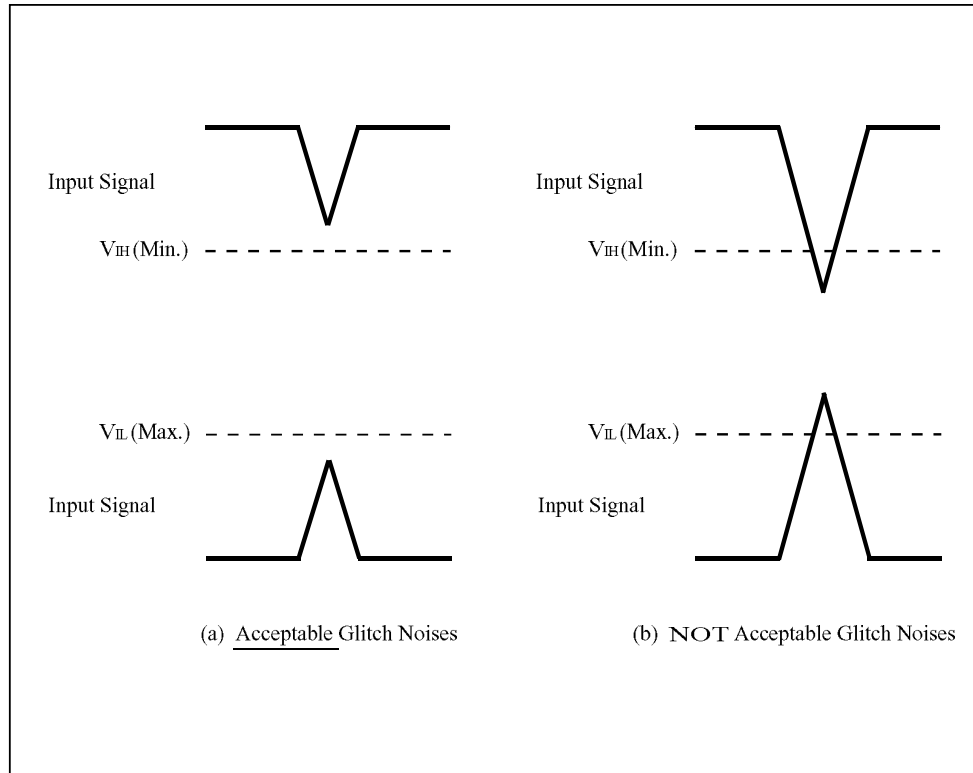

Figure A-2. Waveform for Glitch Noises
