3.3V 8M x 64-Bit SDRAM Module
3.3V 8M x 72-Bit SDRAM Module

HYS64V8000GU-10
HYS72V8000GU-10

168 pin unbuffered DIMM Modules

- 168 Pin JEDEC Standard, Unbuffered 8 Byte Dual-In-Line SDRAM Modules for PC main memory applications
- 1 bank 8M x 64, 8M x 72 organisation
- Optimized for byte-write non-parity or ECC applications
- Fully PC66 layout compatible
- JEDEC standard Synchronous DRAMs (SDRAM)
- Performance:

		-10
f _{CK}	Max. Clock frequency	66 MHz @ CL=2 100 MHz @ CL=3
t _{AC}	Max. access time from clock	8 ns @ CL=2 7 ns @ CL=3

- Single +3.3V(± 0.3V) power supply
- Programmable $\overline{\text{CAS}}$ Latency, Burst Length and Wrap Sequence (Sequential & Interleave)
- Auto Refresh (CBR) and Self Refresh
- Decoupling capacitors mounted on substrate
- All inputs, outputs are LVTTTL compatible
- Serial Presence Detect with E²PROM
- Utilizes eight / nine 8M x 8 SDRAMs in TSOPII-54 packages
- 4096 refresh cycles every 64 ms
- Gold contact pad
- Card Size: 133,35mm x 25,40mm x 4,00 mm

The HYS64(72)V8000GU-10 are industry standard 168-pin 8-byte Dual in-line Memory Modules (DIMMs) which are organised as 8M x 64 and 8M x 72 high speed memory arrays designed with Synchronous DRAMs (SDRAMs) for non-parity and ECC applications. The DIMMs use eight 8M x 8 SDRAMs for the 8M x 64 organisation and an additional SDRAM for the 8M x 72 organisation. Decoupling capacitors are mounted on the PC board.

The DIMMs have a serial presence detect, implemented with a serial E²PROM using the two pin I²C protocol. The first 128 bytes are utilized by the DIMM manufacturer and the second 128 bytes are available to the end user.

All SIEMENS 168-pin DIMMs provide a high performance, flexible 8-byte interface in a 133,35 mm long footprint.

Notes:

7. These parameters depend on the cycle rate and these values are measured by the cycle rate under theminimum value of tck and trc. Input signals are changed one time during tck.
8. These parameter depend on output loading. Specified values are obtained with output open.

Notes:

1. The specified values are valid when addresses are changed no more than once during $t_{CK}(\text{min.})$ and when No Operation commands are registered on every rising clock edge during $t_{RC}(\text{min.})$.
2. The specified values are valid when data inputs (DQs) are stable during $t_{RC}(\text{min.})$.
3. An initial pause of $100\mu\text{s}$ is required after power-up, then a Precharge All Banks command must be given followed by 8 Auto Refresh (CBR) cycles before the Mode Register Set Operation can begin.
4. AC timing tests have $V_{il} = 0.4\text{ V}$ and $V_{ih} = 2.4\text{ V}$ with the timing referenced to the 1.4 V crossover point. The transition time is measured between V_{ih} and V_{il} . All AC measurements assume $t_T = 1\text{ ns}$ with the AC output load circuit shown.

fig.1

5. If clock rising time is longer than 1 ns , a time $(t_T/2 - 0.5)\text{ ns}$ has to be added to this parameter.
6. If t_T is longer than 1 ns , a time $(t_T - 1)\text{ ns}$ has to be added to this parameter.
7. Any time that the refresh Period has been exceeded, a minimum of two Auto (CBR) Refresh commands must be given to "wake-up" the device.
8. Self Refresh Exit is a synchronous operation and begins on the 2nd positive clock edge after CKE returns high. Self Refresh Exit is not complete until a time period equal to t_{RC} is satisfied once the Self Refresh Exit command is registered.
9. Referenced to the time which the output achieves the open circuit condition, not to output voltage levels.

A serial presence detect storage device - E²PROM - is assembled onto the module. Information about the module configuration, speed, etc. is written into the E²PROM device during module production using a serial presence detect protocol (I²C synchronous 2-wire bus)
