

440EPx

Data Sheet

PowerPC 440EPx Embedded Processor

Features

- PowerPC® 440 processor operating up to 667MHz with 32KB I-cache and D-cache with parity checking.
- 16KB of on-chip SRAM.
- Selectable processor:bus clock ratios of N:1, N:2.
- Floating Point Unit with single- and double-precision and single-cycle throughput.
- Dual bridged Processor Local Buses (PLBs) with 64- and 128-bit widths.
- Double Data Rate 2/1 (DDR2/1) Synchronous DRAM (SDRAM) interface operating up to 166MHz (333 MHz data transfer rate) with optional ECC.
- DMA support for external peripherals, internal UART and memory.
- Programmable Interrupt Controller supports interrupts from a variety of sources.
- Programmable General Purpose Timers (GPT).
- PCI V2.2 interface (3.3V only). Thirty-two bits at up to 66MHz.
- Two Ethernet 10/100/1000Mbps half- or full-duplex interfaces. Operational modes supported are with packet reject, Jumbo frames, and interrupt coalescing.
- Up to four serial ports (16550 compatible UART).
- One USB 2.0 Device or Host interface with internal PHY and one USB 2.0 direct Device UTMI interface.
- External peripheral bus (32-bit data) for up to six devices with external mastering.
- Two IIC interfaces (one with boot parameter read capability).
- NAND Flash interface.
- SPI interface.
- General Purpose I/O (GPIO) interface.
- JTAG interface for board level testing.
- Boot from PCI memory, NOR Flash on the external peripheral bus, or NAND Flash on the NAND Flash interface.
- Optional security feature (PPC440EPx-S).
- Available in RoHS compliant, lead-free package.

Description

Designed specifically to address high-end embedded applications, the PowerPC 440EPx (PPC440EPx) provides a high-performance, low-power solution that interfaces to a wide range of peripherals and incorporates on-chip power management features.

This chip contains a high-performance RISC processor, on-chip SRAM, a floating point unit, DDR2/1 SDRAM controller, PCI bus interface, control for external ROM and peripherals, DMA with scatter/gather support, Ethernet ports, serial ports, IIC interfaces, SPI interface, USB ports, NAND Flash interface, an optional security feature

(PPC440EPx-S), and general purpose I/O.

Technology: CMOS Cu-11, 0.13µm.

Package: 35mm, 680-ball thermally enhanced plastic ball grid array (TE-EPBGA). RoHS compliant package available.

Typical power: Less than 3W at 533MHz.

Supply voltages required: 3.3V, 2.5V, 1.8V (DDR2) or 2.5V (DDR1), 1.5V.

Ordering and PVR Information

For information on the availability of the following parts, contact your local AMCC sales office. For additional information on the part number structure see *Figure 1*.

Product Name	Order Part Number (see Notes)	Package	Revision Level	PVR Value	JTAG ID
PPC440EPx	PPC440EPx-SpAffT	35mm, 680 TE-EPBGA	A	0x216218D0	0x0440F1E1
PPC440EPx	PPC440EPx-NpAffT	35mm, 680 TE-EPBGA	A	0x216218D4	0x0440F1E1

Notes: Characters following the dash (-):

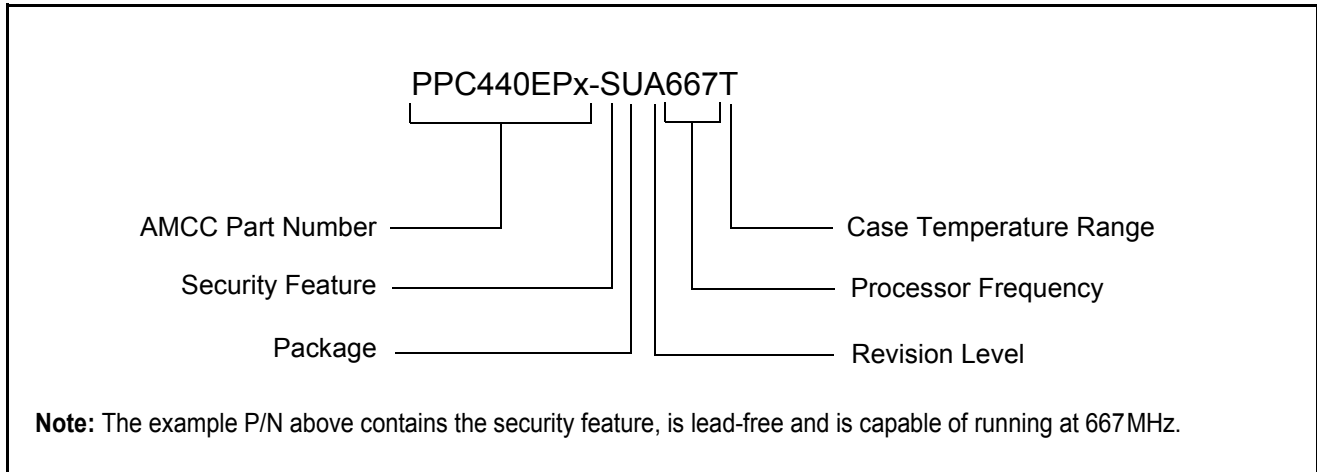

1. S = Security feature present, N = Security feature not present
2. p = Package type: U = lead-free (RoHS compliant), T = contains lead.
3. A = Chip revision level A
4. fff = Processor frequency: 400 = 400MHz, 533 = 533MHz, 667 = 667MHz
5. T = Case temperature range of -40°C to +100°C.

Note: Parts shipped on trays.

Each part number contains a revision code. This is the die mask revision number and is included in the part number for identification purposes only.

The PVR (Processor Version Register) and the JTAG ID register are software accessible (read-only) and contain information that uniquely identifies the part. Refer to the *PPC440EPx User’s Manual* for details on accessing these registers.

Data Sheet**Block Diagram**

Figure 2. PPC440EPx Functional Block Diagram

The PPC440EPx is a system on a chip (SOC) using IBM CoreConnect Bus™ Architecture.

Address Maps

The PPC440EPx incorporates two address maps. The first is a fixed processor System Memory Address Map. This address map defines the possible contents of various address regions which the processor can access. The second is the DCR Address Map for Device Configuration Registers (DCRs). The DCRs are accessed by software running on the PPC440EPx processor through the use of **mtdcr** and **mf dcr** instructions.

Data Sheet

Table 2. DCR Address Map (Sheet 2 of 2)

Function	Start Address	End Address	Size
On Chip Memory (SRAM Controller)	380	38F	16W
Reserved	390	3FF	112W

Notes:

1. DCR addresses are 10 bits (1024 or 1K unique addresses). Each unique address represents a single 32-bit (word) register. One kiloword (1024W) equals 4KB (4096 B).

PowerPC 440 Processor

The PowerPC 440 processor is designed for high-end applications: RAID controllers, SAN, iSCSI, routers, switches, printers, set-top boxes, etc. It implements the Book E PowerPC embedded architecture and uses the 128-bit version of IBM's on-chip CoreConnect Bus Architecture.

Features include:

- Up to 667MHz operation
- PowerPC Book E architecture
- 32KB I-cache, 32KB D-cache
 - UTLB Word Wide parity on data and tag address parity with exception force
- Three logical regions in D-cache: locked, transient, normal
- D-cache full line flush capability
- 41-bit virtual address, 36-bit (64 GB) physical address
- Superscalar, out-of-order execution
- 7-stage pipeline
- 3 execution pipelines
- Dynamic branch prediction
- Memory management unit
 - 64-entry, full associative, unified TLB with optional parity
 - Separate instruction and data micro-TLBs
 - Storage attributes for write-through, cache-inhibited, guarded, and big or little endian
- Debug facilities
 - Multiple instruction and data range breakpoints
 - Data value compare
 - Single step, branch, and trap events
 - Non-invasive real-time trace interface
- 24 DSP instructions
 - Single cycle multiply and multiply-accumulate
 - 32 x 32 integer multiply
 - 16 x 16 -> 32-bit MAC

Floating Point Unit (FPU)

The chip has a built-in super scalar FPU that supports both single- and double-precision operations, and offers single cycle through put on most instructions.

Features include:

- Five stages with 2 MFlops/Hz
- Hardware support for IEEE 754
- Single- and double-precision
- Single-cycle throughput on most instructions
- Thirty-two 64-bit floating point registers

SRAM Controller

The internal SRAM controller (ISC) supports the following features:

- One bank (Bank 0) of 16KB configurable as 4KB, 8KB or 16KB (128 bits wide)
- 128-bit slave attachment addressable by any PLB master
- Transfers by PLB slave cycles:
 - Single-beat read and write (1 to 8 bytes for 64-bit masters, 1 to 16 bytes for 128-bit masters)
 - 4-word line read and write
 - 8-word line read and write
 - Double word read and write bursts for 64-bit masters
 - Quadword read and write bursts for 128-bit masters

Data Sheet

- Slave-terminated double word and quadword fixed length bursts
- Master-terminated variable length bursts
- Guarded memory access on 4 KB boundaries
- Data parity checking
- Data transfers occur at PLB bus speeds.
- Power management

Internal Buses

The PowerPC 440EPx features six standard internal buses: two Processor Local Buses (PLBs), three On-Chip Peripheral Buses (OPBs), and the Device Control Register Bus (DCR). The high performance, high bandwidth cores such as the PowerPC 440 processor, the DDR SDRAM memory controller, and the PCI bridge connect to the PLBs. OPB0 hosts lower data rate peripherals. OPB1 is dedicated to USB 2.0 Device support, and OPB2 is dedicated to USB 2.0 Host. The daisy-chained DCR provides a lower bandwidth path for passing status and control information between the processor and the other on-chip cores.

Features include:

- PLB4 (128-bit)
 - 128-bit implementation of the PLB architecture
 - Separate and simultaneous read and write data paths
 - 36-bit address
 - Simultaneous control, address, and data phases
 - Four levels of pipelining
 - Byte-enable capability supporting unaligned transfers
 - 32- and 64-byte burst transfers
 - 166MHz, maximum 5.3GB/s (simultaneous read and write)
 - Processor:bus clock ratios of N:1 and N:2
- PLB3 (64-bit)
 - 64-bit implementation of the PLB architecture
 - 32-bit address
 - 166MHz (1:1 ratio with PLB4), maximum 1.3GB/s (no simultaneous read and write)
- OPBs (OPB0, OPB1, and OPB2)
 - 32-bit data path
 - 32-bit address
 - 83MHz
- DCR
 - 32-bit data path
 - 10-bit address

Security Function (optional)

The built-in security function (PPC440EPx-S only) is a cryptographic engine attached to the 128-bit PLB with built-in DMA and interrupt controllers.

Features include:

- Federal Information Processing Standard (FIPS) 140-2 design
- Support for an unlimited number of Security Associations (SA)
- Different SA formats for each supported protocol (IPsec/SSL/TLS/sRTP)
- Internet Protocol Security (IPSec) features
- Full packet transforms (ESP & AH)
- Complete header and trailer processing (IPv4 and IPv6)
- Multi-mode automatic padding
- "Mutable bit" handler for AH, including IPv4 option and IPv6 extension headers

- Secure Socket Layer (SSL) and Transport Layer Security (TLS) features
 - Packet transforms
 - One-pass hash-then-encrypt for SSL and TLS packet transforms for inbound packet using Stream Cipher
- Secure Real-Time Protocol (sRTP) features
 - Packet transforms
 - ROC removal and TAG insertion
 - Variable bypass offset of header length per packet
- IPsec/SSL security acceleration engine
- DES, 3DES, AES, ARC-4 encryption
- MD-5, SHA-1 hashing, HMAC encrypt-hash and hash-decrypt, and KASUMI
- Public key acceleration for RSA, DSA and Diffie-Hellman
- True or pseudo random number generators
 - Non-deterministic true random numbers
 - Pseudo random numbers with lengths of 8B or 16B
 - ANSI X9.17 Annex C compliant using a DES algorithm
- Interrupt controller
 - Fifteen programmable, maskable interrupts
 - Initiate commands via an input interrupt
 - Sixteen programmable interrupts indicating completion of certain operations
 - All interrupts mapped to one level- or edge-sensitive programmable interrupt output
- DMA controller
 - Autonomous, 4-channel
 - 1024-words (32 bits/word) per DMA transfer
 - Scatter/gather capability with byte aligned addressing

KASUMI Algorithm (optional)

- Key scheduling hardware
- *f8* and *f9* algorithm support
- Automatic data padding mechanism for *f9* algorithm
- KASUMI encryption and decryption modes
- 32-bit slave interface
- Fully synchronous to PLB clock

PCI Controller

The PCI interface allows connection of PCI devices to the PowerPC processor and local memory. This interface is designed to Version 2.2 of the PCI Specification and supports 32-bit PCI devices.

Reference Specifications:

- PowerPC CoreConnect Bus (PLB) Specification Version 3.1
- PCI Specification Version 2.2
- PCI Bus Power Management Interface Specification Version 1.1

Features include:

- PCI 2.2
 - Frequency to 66MHz
 - 32-bit bus
- PCI Host Bus Bridge or an Adapter Device's PCI interface
- Internal PCI arbitration function, supporting up to six external devices, that can be disabled for use with an external arbiter
- Support for Message Signaled Interrupts
- Simple message passing capability
- Asynchronous to the PLB

Data Sheet

- PCI Power Management 1.1
- PCI register set addressable both from on-chip processor and PCI device sides
- Ability to boot from PCI bus memory
- Error tracking/status
- Supports initiation of transfers of the following types:
 - Single beat I/O reads and writes
 - Single beat and burst memory reads and writes
 - Single beat configuration reads and writes (type 0 and type 1)
 - Single beat special cycles

DDR2/1 SDRAM Memory Controller

The Double Data Rate 2/1 (DDR2/1) SDRAM memory controller supports industry standard discrete devices that are compatible with both the DDR1 or DDR2 specifications. The correct I/O supply voltage must be provided for the two types of DDR devices: DDR1 devices require +2.5V and DDR2 devices require +1.8V.

Global memory timings, address and bank sizes, and memory addressing modes are programmable.

Features include:

- 32-bit memory interface for DDR1
- 32- or 64-bit memory interface for DDR2
- Optional Error Checking and Correcting (ECC)
- 2.6-GB/s peak data rate
- Two memory banks of up to 1 GB each
- Maximum capacity of 2GB
- Support for 128-Mb, 256-Mb, 512-Mb, and 1-Gb DDR devices, with CAS latencies of 2, 2.5, or 3
- Clock frequencies from 133MHz (266Mbps) to 166MHz (333Mbps) supported (Faster parts may be used, but must be clocked no faster than 166MHz)
- Page mode accesses (up to 16 open pages) with configurable paging policy
- Programmable address mapping and timing
- Software initiated self-refresh
- Power management (self-refresh, suspend, sleep)
- One or two chip selects

External Peripheral Bus Controller (EBC)

Features include:

- Up to six ROM, EPROM, SRAM, Flash memory, and slave peripheral I/O banks supported
- Up to 83MHz operation
- Burst and non-burst devices
- 32-bit byte-addressable data bus
- Data parity
- 30-bit address
- Peripheral Device pacing with external "Ready"
- Latch data on Ready, synchronous or asynchronous
- Programmable access timing per device
 - 256 Wait States for non-burst
 - 32 Burst Wait States for first access and up to 8 Wait States for subsequent accesses
 - Programmable C_{son}, C_{soff} relative to address
 - Programmable OE_{on}, WE_{on}, WE_{off} (1 to 4 clock cycles) relative to CS
- Programmable address mapping
- External DMA Slave Support

- External master interface
 - Write posting from external master
 - Read prefetching on PLB for external master reads
 - Bursting capable from external master
 - Allows external master access to all non-EBC PLB slaves
 - External master can control EBC slaves for access

Ethernet Controller

Ethernet support provided by the PPC440EPx interfaces to the physical layer but the PHY is not included on the chip:

- Two 10/100/1000 interfaces running in full- and half-duplex modes providing:
 - One Gigabit Media Independent Interface (GMII)
 - One Media Independent Interface (MII)
 - Two Reduced Gigabit MII (RGMII)
 - Two Serial MII (SMII) at 100/10Mbps.
 - Packet reject support
 - Jumbo frame support
 - DMA capability
 - Interrupt coalescence

DMA-to-PLB3 (64-bit) Controller

This DMA controller provides a DMA interface between OPB0 and PLB3.

Features include:

- Supports the following transfers:
 - Memory-to-memory transfers
 - Buffered peripheral to memory transfers
 - Buffered memory to peripheral transfers
- Four channels
- Scatter/Gather capability for programming multiple DMA operations
- 32-byte buffer
- 8-, 16-, 32-bit peripheral support (OPB and external)
- 32-bit addressing
- Address increment or decrement
- Supports internal and external peripherals
- Support for memory mapped peripherals
- Support for peripherals running on slower frequency buses

DMA-to-PLB4 (128-bit) Controller

This DMA controller provides a DMA interface between the OPB1 dedicated to the USB 2.0 device ports and PLB4.

Features include:

- Four independent channels supporting internal USB 2.0 Device endpoints 1 and 2
- Support for memory-to-memory, peripheral-to-memory, and memory-to-peripheral transfers
- Scatter/gather capability
- 128-byte buffer with programmable thresholds

Data Sheet

Serial Ports (UART)

Features include:

- Up to four ports in the following combinations:
 - One 8-pin (UART0)
 - Two 4-pin (UART0 and UART1)
 - One 4-pin (UART0) and two 2-pin (UART1 and UART2)
 - Four 2-pin (UART0, UART1, UART2, and UART3)
- Selectable internal or external serial clock to allow wide range of baud rates
- Register compatibility with NS16550 register set
- Complete status reporting capability
- Fully programmable serial-interface characteristics
- Supports DMA using internal DMA function on PLB3

IIC Bus Controller

Features include:

- Two IIC interfaces provided
- Support for Philips® Semiconductors I²C Specification, dated 1995
- Operation at 100kHz or 400kHz
- 8-bit data
- 10- or 7-bit address
- Slave transmitter and receiver
- Master transmitter and receiver
- Multiple bus masters
- Two independent 4 x 1 byte data buffers
- Twelve memory-mapped, fully programmable configuration registers
- One programmable interrupt request signal
- Provides full management of all IIC bus protocols
- Programmable error recovery
- Includes an integrated bootstrap controller (BSC) that is multiplexed with the IIC0 interface

Serial Peripheral Controller (SPI/SCP)

The Serial Peripheral Interface (also known as the Serial Communications Port) is a full-duplex, synchronous, character-oriented (byte) port that allows the exchange of data with other serial devices. The SCP is a master on the serial port supporting a 3-wire interface (receive, transmit, and clock), and is a slave on the OPB.

Features include:

- Three-wire serial port interface
- Full-duplex synchronous operation
- SCP bus master
- OPB bus slave
- Programmable clock rate divider
- Clock inversion
- Reverse data
- Local data loop back for test

Universal Serial Bus 2.0 (USB)

The USB 2.0 interface provides both device and host support. One interface provides host or device support and operates through an internal PHY. The other interface provides device support only through the UTMI interface with no internal PHY.

Features include:

- USB 2.0 Host with internal PHY
 - Fully compliant to the following specifications:
 - Universal Serial Bus Specification, Revision 2.0.
 - Enhanced Host Controller Interface (EHCI) Specification for USB, Revision 2.0.
 - Open Host Controller Interface (OHCI) Specification for USB, Revision 1.0a.
 - One USB port provided through a UTMI transceiver interface connected to the internal USB 2.0 Physical Layer (Single port USB 2.0 Physical Layer UTMI+ version 1.05).
 - One USB EHCI high speed (480Mbps) host controller with 1024-byte packet buffer.
 - One USB OHCI full/low speed (12Mbps/1.5Mbps) host controller.
 - Host controller does not support high-bandwidth isochronous transfers
 - Independent OPB master and slave ports which run asynchronously to the USB clocks.
 - USB OHC/EHCI registers and data structures implemented in Big Endian format.
- USB 2.0 Device UTMI or USB 2.0 Device with internal PHY (excluding USB 2.0 Host function)
 - Device support provides six end points (3 IN, 3 OUT)
 - 8192-byte FIFO by endpoint (supports high-bandwidth isochronous transfers, double buffering of 1024-byte packets)
 - FIFOs are not shared between IN and OUT endpoints
 - Two USB 2.0 device end points have DMA dedicated channels (DMA-to-PLB4)

NAND Flash Controller

The NAND Flash controller provides a simple interface between the EBC and up to four separate external NAND Flash devices. It provides both direct command, address, and data access to the external device as well as a memory-mapped linear region that generates data accesses. NAND Flash data is transferred on the peripheral data bus.

Features include:

- One to four banks supported on EBC
- Direct interface to:
 - Discrete NAND Flash devices (up to four devices)
 - SmartMedia Card socket (22-pins)
- Device Sizes:
 - 4MB and larger supported for read/write access
 - 4MB to 256MB for boot-from-NAND flash (size supported depends on addressing mode)
- (512 + 16)-B or (2K + 64)-B page sizes supported
- Boot-from-NAND
 - Execute up to 4KB of boot code out of first block
 - Automatic page read accesses performed based on device configuration and addressing mode
- ECC provides single-bit error correction and double-bit error detection in each 256B of stored data

General Purpose Timers (GPT)

Provides a separate time base counter and additional system timers in addition to those defined in the processor.

Features include:

- 32-bit Time Base Counter driven by the OPB bus clock
- Seven 32-bit compare timers

Data Sheet

General Purpose IO (GPIO) Controller

- Controller functions and GPIO registers are programmed and accessed via memory-mapped OPB bus master accesses.
- 64 GPIOs are multiplexed with other functions. DCRs control whether a particular pin that has GPIO capabilities acts as a GPIO or is used for another purpose.
- Each GPIO output is separately programmable to emulate an open drain driver (that is, drives to zero, tri-stated if output bit is 1).

Universal Interrupt Controller (UIC)

Two Universal Interrupt Controllers (UIC) are employed. They provide control, status, and communications necessary between the external and internal sources of interrupts and the on-chip PowerPC processor.

Note: Processor specific interrupts (for example, page faults) do not use UIC resources.

Features include:

- 10 external interrupts
- Edge triggered or level-sensitive
- Positive or negative active
- Non-critical or critical interrupt to the on-chip processor
- Programmable interrupt priority ordering
- Programmable critical interrupt vector for faster vector processing

JTAG

Features include:

- IEEE 1149.1 Test Access Port
- JTAG Boundary Scan Description Language (BSDL)
- Refer to <http://www.amcc.com/Embedded/Partners> for a list of AMCC partners supplying probes for use with this port.

Solder Ball Metallurgy	63Sn/37Pb	Sn/4Ag/05Cu

Signal Lists

The following table lists all the external signals in alphabetical order and shows the ball (pin) number on which the signal appears. Multiplexed signals are shown with the default signal (following reset) *not* in brackets and alternate signals in brackets. Multiplexed signals appear alphabetically multiple times in the list—once for each signal name on the ball. The page number listed gives the page in *Table 8* on page 56 where the signals in the indicated interface group begin. In cases where signals in the same interface group (for example, Ethernet) have different names to distinguish variations in the mode of operation, the names are separated by a comma with the primary mode name appearing first. In cases where the signals have the same function but are associated with different ports (for example, UART), the signals are separated by a slash (/). These signals are listed only once, and appear alphabetically by the primary mode or primary port name.

Signals in Ball Assignment Order

In the following table, only the primary (default) signal name is shown for each ball. Multiplexed or multifunction signals are marked with an asterisk (*). To determine what other signals or functions are on those balls, look up the primary signal name in *Table 5* on page 20.

Data Sheet

Signal Descriptions

The PPC440EPx embedded controller is packaged in a 680-ball thermally enhanced plastic ball grid array (TE-PBGA). The following tables describe the package level pin-out.

Table 7. Pin Summary

Group	No. of Pins
Total Signal Pins	367
AV _{DD}	1
AGND	1
EAV _{DD}	1
EAGND	1
UAV _{DD}	4
UAGND	5
OV _{DD}	26
SOV _{DD}	14
EOV _{DD}	12
V _{DD}	56
GND	192
Total Power Pins	313
Reserved	0
Total Pins	680

In the table *Table 8* on page 56, each I/O signal is listed along with a short description of its function. Active-low signals (for example, RAS) are marked with an overline. Please see *Table 5* on page 20 for the pin (ball) number to which each signal is assigned.

Multiplexed Signals

Some signals are multiplexed on the same pin so that the pin can be used for different functions. In most cases, the signal names shown in this table are not accompanied by signal names that may be multiplexed on the same pin. If you need to know what, if any, signals are multiplexed with a particular signal, look up the name in *Table 5* on page 20. It is expected that in any single application a particular pin will always be programmed to serve the same function. The flexibility of multiplexing allows a single chip to offer a richer pin selection than would otherwise be possible.

Note: Signals multiplexed with GPIO default to GPIO receivers and float after reset. Initialization software must configure the GPIO registers for the desired function as described in the GPIO chapter of the user's manual. Any of these signals requiring a particular state prior to running initialization code must be terminated with pull ups or pull downs.

Multipurpose Signals

In addition to multiplexing, some pins are also multi-purpose. For example, the EBC peripheral controller address pins (PerAddr) are used as outputs by the PPC440EPx to broadcast an address to external slave devices when the PPC440EPx has control of the external bus. When, during normal operation, an external master gains ownership

Data Sheet

of the external bus, these same pins are used as inputs which are driven by the external master and received by the EBC in the PPC440EPx. In this example, the pins are also bidirectional, serving both as inputs and outputs.

Multimode Signals

In some cases (for example, Ethernet) the function of a pin may vary with different modes of operation. When a pin has multiple signal names assigned to distinguish different modes of operation, all of the names are shown.

Strapping Pins

One group of pins is used as strapped inputs during system reset. These pins function as strapped inputs only during reset and are used for other functions during normal operation (see “Strapping” on page 89). Note that these are *not multiplexed* pins since the function of the pins is not programmable.

Unused I/Os

Termination of unused receivers is generally required; however, there are some exceptions that reduce or eliminate the need for termination.

Signals Multiplexed with GPIO:

By default after reset, signals shared with GPIO pins are configured as GPIO receivers. Termination however, is not needed if the GPIO during initialization are configured as outputs. To configure as drivers, set and clear the appropriate bits in the GPIOx_ODR, GPIOx_TCR and GPIOx_OR registers as described in the GPIO chapter of the user’s manual.

PCI:

When the PCI bridge is unused, configure the PCI controller to park on the bus by pulling the PCIReg0[Gnt] signal low. Parking forces the PLB3 to PCI bridge to actively drive PCIAD31:0 and PCIC3:0[BE3:0]. The remaining PCI control signals must be terminated as follows:

- Disable the internal PCI arbiter and enable PCI synchronous mode. (See IIC Boot Strap Chapter in the user’s manual).

Note: Synchronous mode is not supported when operating the PCI bus. (This mode should only be used for terminating an unused PCI interface).

- Individually connect PCISerr, PCITRDY, and PCIStop through 3k Ω resistors to +3.3V.
- Individually connect PCIReq1:5 through 3k Ω resistors to +3.3V.
- Connect PCIReq0[Gnt] through 1k Ω resistor to GND.

DDR:

- In 32 bit mode, termination is not needed on the upper data, strobe and mask signals when the DDR I/O and DDR controller are configured for 32 bit mode, SDR0_DDRCFG[64B32B]=0 and DDR0_14[REDUC]=1.
- Termination of unused ECC signals (ECC0:7, DM8, DQS8) is not needed.

GMII and MII:

- Configure EMAC0 and EMAC1 to use internal clocks by setting SDR0_MFR[EnCS]=1 and reset EMACn by setting EMACn_MR0[SRST]=1.
- Pull down the following signals with 1K resistor: GMCCRefClk, GMCCD, GMCTxCLK and GMCRxCik. Pull downs are only required if the interface is never used.

SMIIx

- Configure the unused EMACn to use an internal clock by setting SDR0_MFR[EnCS]=1 and reset EMACn by setting EMACn_MR1[SRST]=1.
- No pull ups or pull downs required.

RGMIIX

- Configure the unused EMACn to use an internal clock by setting SDR0_MFR[EnCS]=1 and reset EMACn by setting EMACn_MR1[SRST]=1
- Pull down the unused GMCnRxClk signal with a 1K resistor. Pull down is only required if the interface is never used.

Table 8. Signal Functional Description (Sheet 1 of 9)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} (EOV_{DD} for Ethernet)
3. Must pull down (recommended value is 1k Ω)
4. If not used, must pull up (recommended value is 3k Ω to OV_{DD} (EOV_{DD} for Ethernet)
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up or pull-down required

Signal Name	Description	I/O	Type	Notes
PCI Interface				
PCIAD00:31	Address/Data bus (bidirectional).	I/O	3.3V PCI	
PCIC0:3/BE0:3	PCI Command/Byte Enables.	I/O	3.3V PCI	
PCIClk	Provides timing to the PCI interface for PCI transactions.	I	3.3V PCI	1, 5
PCIDevSel	Indicates the driving device has decoded its address as the target of the current access. (PCI 2.2 specification requires 8.2K Ω pull up on host system)	I/O	3.3V PCI	
PCIFrame	Driven by the current master to indicate beginning and duration of an access. (PCI 2.2 specification requires 8.2K Ω pull up on host system)	I/O	3.3V PCI	
PCIGnt0/Req	Indicates that the specified agent is granted access to the bus. When the internal arbiter is enabled, output is PCIGnt0. When the internal arbiter is disabled, output is Req.	O	3.3V PCI	
PCIGnt1:5	Indicates that the specified agent is granted access to the bus. Used only when internal PCI arbiter enabled.	O	3.3V PCI	
PCIIDSel	Used as a chip select during configuration read and write transactions.	I	3.3V PCI	
PCIINT	Level sensitive PCI interrupt.	O	3.3V PCI	
PCIIRDY	Indicates initiating agent's ability to complete the current data phase of the transaction. (PCI 2.2 specification requires 8.2K Ω pull up on host system)	I/O	3.3V PCI	
PCIPar	Even parity.	I/O	3.3V PCI	
PCIPERR	Reports data parity errors during all PCI transactions except a Special Cycle. (PCI 2.2 specification requires 8.2K Ω pull up on host system)	I/O	3.3V PCI	
PCIREQ0/Gnt	Indicates to the PCI arbiter that the specified agent wishes to use the bus. When the internal arbiter is enabled, input is PCIREQ0. When internal arbiter is disabled, input is Gnt.	I	3.3V PCI	1, 4
PCIREQ1:5	An indication to the PCI arbiter that the specified agent wishes to use the bus. Used only when internal PCI arbiter enabled.	I	3.3V PCI	1, 4
PCIReset	Brings PCI device registers and logic to a consistent state.	O	3.3V PCI	
PCISErr	Reports address parity errors, data parity errors on the Special Cycle command, or other catastrophic system errors. (PCI 2.2 specification requires 8.2K Ω pull up on host system)	I/O	3.3V PCI	
PCIStop	Indicates the current target is requesting the master to stop the current transaction. (PCI 2.2 specification requires 8.2K Ω pull up on host system)	I/O	3.3V PCI	
PCITRDY	Indicates the target agent's ability to complete the current data phase of the transaction. (PCI 2.2 specification requires 8.2K Ω pull up on host system)	I/O	3.3V PCI	

Data Sheet

Table 8. Signal Functional Description (Sheet 2 of 9)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} (EOV_{DD} for Ethernet)
3. Must pull down (recommended value is 1k Ω)
4. If not used, must pull up (recommended value is 3k Ω to OV_{DD} (EOV_{DD} for Ethernet)
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up or pull-down required

Signal Name	Description	I/O	Type	Notes
DDR2/1 SDRAM Interface				
BA0:2	Bank Address supporting up to eight internal banks.	O	2.5V (1.8V) SDRAM-DDR	
BankSel0:1	Selects up to two external DDR SDRAM banks.	O	2.5V (1.8V) SDRAM-DDR	
CAS	Column Address Strobe.	O	2.5V (1.8V) SDRAM-DDR	
ClkEn	Clock Enable.	O	2.5V (1.8V) SDRAM-DDR	
DM0:7 DM8	Memory write data byte lane masks. DM8 is the byte lane mask for the ECC byte lane.	O	2.5V (1.8V) SDRAM-DDR	
DQS0:7 DQS8	Byte lane data strobe. Byte lane data strobe for ECC.	I/O	2.5V (1.8V) SDRAM-DDR	
ECC0:7	ECC check bits 0:7.	I/O	2.5V (1.8V) SDRAM-DDR	
MemAddr00:13	Memory address bus.	O	2.5V (1.8V) SDRAM-DDR	
MemData00:63	Memory data bus (MemData32:63 available for DDR2 only).	I/O	2.5V (1.8V) SDRAM-DDR	
MemClkOut MemClkOut	Subsystem clock.	O	2.5V (1.8V) SDRAM-DDR Diff driver	
MemODT0:1	DDR2 On-die termination enable (not used with DDR1).	O	2.5V (1.8V) SDRAM-DDR	
RAS	Row Address Strobe.	O	2.5V (1.8V) SDRAM-DDR	
WE	Write Enable.	O	2.5V (1.8V) SDRAM-DDR	
S _{VREF1A:B}	DDR SDRAM reference voltage 1 input.	I	Volt ref receiver (1.25V or 0.9V)	
S _{VREF2A:B}	DDR SDRAM reference voltage 2 input.	I	Volt ref driver (1.25V or 0.9V)	

Table 8. Signal Functional Description (Sheet 3 of 9)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} (EOV_{DD} for Ethernet)
3. Must pull down (recommended value is 1k Ω)
4. If not used, must pull up (recommended value is 3k Ω to OV_{DD} (EOV_{DD} for Ethernet)
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up or pull-down required

Signal Name	Description	I/O	Type	Notes
Ethernet Interface				
GMCRxD0:1, GMC0RxD0:1, SMII0:1RxD	GMII/MII: Receive data. RGMII 0: Receive data. SMII 0:1: Receive data.	I	3.3V tolerant 2.5V CMOS	1
GMCRxD2:3 GMC0RxD2:3	GMII/MII: Receive data. RGMII 0: Receive data.	I	3.3V tolerant 2.5V CMOS	1
GMCRxD4:7, GMC1RxD0:3	GMII/MII: Receive data. RGMII 1: Receive data.	I	3.3V tolerant 2.5V CMOS	1
GMCTxD0:1, GMC0TxD0:1, SMII0:1TxD	GMII/MII: Transmit data. RGMII 0: Transmit data. SMII 0:1: Transmit data.	O	3.3V tolerant 2.5V CMOS	
GMCTxD2:3, GMC0TxD2:3	GMII/MII: Transmit data. RGMII 0: Transmit data.	O	3.3V tolerant 2.5V CMOS	1
GMCTxD4:7, GMC1TxD0:3	GMII/MII: Transmit data. RGMII 1: Transmit data.	O	3.3V tolerant 2.5V CMOS	1
GMCRxEr, GMC1RxCtl	GMII/MII: Receive error. RGMII 1: Receive control.	I	3.3V tolerant 2.5V CMOS	1
GMCRxCIk, GMC0RxCIk, SMIISync	GMII/MII: Receive clock. RGMII 0: Receive clock. SMII: Synchronizing signal. Note: Redrive SMIISync when driving more than one load. SMIISync is a weak driver.	I	3.3V tolerant 2.5V CMOS	1, 5
GMCRxDV, GMC0RxCtl	GMII/MII: Receive data valid. RGMII 0: Receive control.	I	3.3V tolerant 2.5V CMOS	1
GMCCrS, GMC1TxCIk	GMII/MII: Carrier sense. RGMII 1: Transmit clock.	I/O	3.3V tolerant 2.5V CMOS	1
GMCTxEr, GMC1TxCtl	GMII/MII: Transmit error. RGMII 1: Transmit control.	O	3.3V tolerant 2.5V CMOS	
GMCTxEn, GMC0TxCtl	GMII/MII: Transmit enable. RGMII 0: Transmit control.	O	3.3V tolerant 2.5V CMOS	
GMCTxCIk	MII: Transmit clock for MII.	I	3.3V tolerant 2.5V CMOS	1, 5
GMCCD, GMC1RxCIk	GMII/MII: Collision detect. RGMII 1: Receive clock.	I	3.3V tolerant 2.5V CMOS	1, 5
GMCMDCIk	Management data clock	O	3.3V tolerant 2.5V CMOS	
GMCMDDIO	Management data I/O	I/O	3.3V tolerant 2.5V CMOS	
GMCGTxCIk, GMC0TxCIk	GMII: Transmit clock for GMII. RGMII 0: Transmit clock.	O	3.3V tolerant 2.5V CMOS	
GMCRRefCIk, SMIIRefCIk	GMII, RGMII: Reference clock. SMII: Reference clock.	I	3.3V tolerant 2.5V CMOS Rcvr	1, 5
RejectPkt0:1	External request to reject a packet.	I	3.3V tolerant 2.5V CMOS	1

Data Sheet

Table 8. Signal Functional Description (Sheet 4 of 9)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} (EOV_{DD} for Ethernet)
3. Must pull down (recommended value is 1k Ω)
4. If not used, must pull up (recommended value is 3k Ω to OV_{DD} (EOV_{DD} for Ethernet)
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up or pull-down required

Signal Name	Description	I/O	Type	Notes
External Slave Peripheral Interface				
DMAAck0:3	Used by the PPC440EPx to indicate that data transfers have occurred.	O	3.3V LVTTTL	1
DMAReq0	Used by slave peripherals to indicate they are prepared to transfer data.	I	3.3V LVTTTL	1
DMAReq1	Used by slave peripherals to indicate they are prepared to transfer data.	I	3.3V LVTTTL	1, 5
DMAReq2:3	Used by slave peripherals to indicate they are prepared to transfer data.	I	3.3V LVTTTL	1
EOT0:3/TC0:3	End Of Transfer/Terminal Count.	I/O	3.3V LVTTTL	1
PerAddr02:07	Peripheral address bus used by the PPC440EPx when not in external master mode; otherwise, used by external master.	I/O	3.3V LVTTTL	1, 2
PerAddr08:31	Peripheral address bus used by the PPC440EPx when not in external master mode; otherwise, used by external master.	I/O	3.3V LVTTTL	
PerData00:31	Peripheral data bus used by the PPC440EPx when not in external master mode; otherwise, used by external master. Note: PerData00 is the most significant bit (msb) on this bus.	I/O	3.3V LVTTTL	
PerDataPar0:3	Peripheral data bus parity used by the PPC440EPx when not in external master mode; otherwise, used by external master.	I/O	3.3V LVTTTL	
PerBLast	Used by either the peripheral controller, DMA controller, or external master to indicate the last transfer of a memory access.	I/O	3.3V LVTTTL	1, 4
PerCS0	External peripheral device select.	O	3.3V LVTTTL	2
PerCS1:5	External peripheral device select.	I/O	3.3V LVTTTL	1, 2
PerOE	Used by either peripheral controller or DMA controller depending upon the type of transfer involved. When the PPC440EPx is the bus master, it enables the selected device to drive the bus.	O	3.3V LVTTTL	1, 2
PerReady	Used by a peripheral slave to indicate it is ready to transfer data.	I	3.3V LVTTTL	1
PerR/ \overline{W}	Used by the PPC440EPx when not in external master mode, as output by either the peripheral controller or DMA controller depending upon the type of transfer involved. High indicates a read from memory, low indicates a write to memory. Otherwise, it is used by the external master as an input to indicate the direction of transfer.	I/O	3.3V LVTTTL	1, 2
PerWBE0:3	External peripheral data bus byte enables.	I/O	3.3V LVTTTL	1, 2
PerErr	External Error. Used as an input to record external slave peripheral errors.	I	3.3V LVTTTL	1

Table 8. Signal Functional Description (Sheet 5 of 9)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} (EOV_{DD} for Ethernet)
3. Must pull down (recommended value is 1k Ω)
4. If not used, must pull up (recommended value is 3k Ω to OV_{DD} (EOV_{DD} for Ethernet)
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up or pull-down required

Signal Name	Description	I/O	Type	Notes
External Master Peripheral Interface				
BusReq	Bus Request. Used when the PPC440EPx needs to regain control of peripheral interface from an external master.	O	3.3V LVTTTL	
$\overline{\text{ExtAck}}$	External Acknowledgement. Used by the PPC440EPx to indicate that a data transfer occurred.	O	3.3V LVTTTL	
$\overline{\text{ExtReq}}$	External Request. Used by an external master to indicate it is prepared to transfer data.	I	3.3V LVTTTL	1
$\overline{\text{ExtReset}}$	Peripheral Reset. Used by an external master and by synchronous peripheral slaves. Note: The state of signals or clocks cannot be guaranteed until the ExtReset signal has been de-asserted.	O	3.3V LVTTTL	
HoldAck	Hold Acknowledge. Used by the PPC440EPx to transfer ownership of peripheral bus to an external master.	O	3.3V LVTTTL	
HoldReq	Hold Request. Used by an external master to request ownership of the peripheral bus.	I	3.3V LVTTTL	
HoldPri	Hold Primary. Used by an external master to indicate the priority of a given external master tenure.	I	3.3V LVTTTL w/pull-up	
PerClk	Peripheral Clock. Used by an external master and by synchronous peripheral slaves.	O	3.3V LVTTTL	1
UART Peripheral Interface				
The UART interface can be configured as follows:				
1. One 8-pin, where n = 0				
2. Two 4-pin, where n = 0 & 1				
3. One 4-pin, where n = 0 and two 2-pin, where n = 1 & 2				
4. Four 2-pin, where n = 0 & 1 & 2 & 3				
UARTSerClk	The SerClk input provides an alternative to the internally generated serial clock. It is used in cases where the allowable internally generated clock rates are not satisfactory.	I	3.3V LVTTTL	1, 4
UARTn_Rx	Receive data.	I	3.3V LVTTTL Rcvr	1, 4
UARTn_Tx	Transmit data.	O	3.3V LVTTTL	
$\overline{\text{UARTn_DCD}}$	Data Carrier Detect.	I	3.3V LVTTTL	1, 6
$\overline{\text{UARTn_DSR}}$	Data Set Ready.	I	3.3V LVTTTL	1, 6
$\overline{\text{UARTn_CTS}}$	Clear To Send.	I	3.3V LVTTTL	1, 6
$\overline{\text{UARTn_DTR}}$	Data Terminal Ready.	O	3.3V LVTTTL	1
$\overline{\text{UARTn_RTS}}$	Request To Send.	O	3.3V LVTTTL	1
UARTn_RI	Ring Indicator.	I	3.3V LVTTTL	1
IIC Peripheral Interface				
IIC0SClk	IIC0 Serial Clock.	I/O	3.3V LVTTTL	1, 2
IIC0SData	IIC0 Serial Data.	I/O	3.3V LVTTTL	1, 2
IIC1SClk	IIC1 Serial Clock.	I/O	3.3V LVTTTL	2
IIC1SData	IIC1 Serial Data.	I/O	3.3V LVTTTL	2

Data Sheet

Table 8. Signal Functional Description (Sheet 6 of 9)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} (EOV_{DD} for Ethernet)
3. Must pull down (recommended value is 1k Ω)
4. If not used, must pull up (recommended value is 3k Ω to OV_{DD} (EOV_{DD} for Ethernet)
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up or pull-down required

Signal Name	Description	I/O	Type	Notes
USB UTMI Peripheral Interface				
USB2DI7:0	Unidirectional data inputs.	I/O	3.3V LVTTTL	
USB2DO7:0	Unidirectional data outputs.	I/O	3.3V LVTTTL	
USB2TxRdy	Transmit data ready.	I	3.3V LVTTTL w/pull-down	
USB2RxAct	Receive active.	I	3.3V LVTTTL	
USB2RxDV	Receive valid.	I/O	3.3V LVTTTL w/pull-up	1
USB2RxErr	Receive error.	I/O	3.3V LVTTTL	1
USB2LS0:1	Line state 0 and Line state 1.	I	3.3V LVTTTL w/pull-up	
USB2TxVal	Transmit valid.	I/O	3.3V LVTTTL	1
USB2Susp	Suspend.	I/O	3.3V LVTTTL	1
USB2XcwrSel	Transceiver select.	I/O	3.3V LVTTTL	1
USB2TermSel	Termination select.	I/O	3.3V LVTTTL	1
USB2OM0:1	Operational mode.	I/O	3.3V LVTTTL	1
USB2Clk	USB 2.0 Clock (60MHz).	I	3.3V LVTTTL	1, 5
USB PHY Peripheral Interface				
USB2Xcwr USB2Xcwr	USB 2.0 differential transceiver.	I/O	5V tolerant Analog	5
USB2XtalIn USB2XtalOut	USB 2.0 external crystal (48MHz) or external oscillator (48MHz). External crystal: In/Out differential must not be less than 500mV. External oscillator: Connect oscillator with signal swing of 3.3V between USB2XtalOut and ground. See Table 19 on page 74.	I/O	Analog	
USB2RExt	External resistor connection for bias current. Use 3.4k Ω , 1% resistor connected to GND.	I/O	Analog	
NAND Flash Interface				
NFALE	Address Latch Enable.	O	3.3V LVTTTL	1
NFCE0:3	Chip Enable (multiplexed with the $\overline{\text{PerCS0:3}}$ signals).	O	3.3V LVTTTL	1
NFCLE	Command Latch Enable. Latches operational commands into the NAND Flash.	O	3.3V LVTTTL	1
$\overline{\text{NFRdy}}/\overline{\text{Busy}}$	Ready/Busy. Indicates status of device during program erase or page read. This signal is wire-OR connected from all NAND Flash devices.	I	3.3V LVTTTL	1
$\overline{\text{NFREn}}$	Read Enable. Data is latched on the rising edge.	O	3.3V LVTTTL	1
$\overline{\text{NFWEn}}$	Write Enable. Data is latched on the rising edge.	O	3.3V LVTTTL	1

Table 8. Signal Functional Description (Sheet 7 of 9)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} (EOV_{DD} for Ethernet)
3. Must pull down (recommended value is 1k Ω)
4. If not used, must pull up (recommended value is 3k Ω to OV_{DD} (EOV_{DD} for Ethernet)
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up or pull-down required

Signal Name	Description	I/O	Type	Notes
Serial Peripheral Interface				
SCPClkOut	Clock output.	I/O	3.3V LVTTTL	2
SCPDI	Data input.	I/O	3.3V LVTTTL	2
SCPDO	Data output.	O	3.3V LVTTTL	2
Interrupts Interface				
IRQ0:4	External interrupt requests 0 through 4.	I/O	3.3V LVTTTL	1
IRQ5	External interrupt request 5.	I	3.3V LVTTTL Rcvr	1, 5
IRQ6:9	External interrupt requests 6 through 9.	I/O	3.3V LVTTTL	1
JTAG Interface				
TCK	Test Clock.	I	3.3V LVTTTL w/pull-up	1
TDI	Test Data In.	I	3.3V LVTTTL w/pull-up	1, 4
TDO	Test Data Out.	O	3.3V LVTTTL	
TMS	Test Mode Select.	I	3.3V LVTTTL w/pull-up	1
$\overline{\text{TRST}}$	Test Reset. Note: Must be asserted low during a power-on system reset in order to reset the JTAG interface. If the JTAG interface is not reset, the processor may not boot.	I	3.3V LVTTTL w/pull-up	1, 5

Data Sheet

Table 8. Signal Functional Description (Sheet 8 of 9)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} (EOV_{DD} for Ethernet)
3. Must pull down (recommended value is 1k Ω)
4. If not used, must pull up (recommended value is 3k Ω to OV_{DD} (EOV_{DD} for Ethernet)
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up or pull-down required

Signal Name	Description	I/O	Type	Notes
System Interface				
SysClk	Main system clock input.	I	3.3V tolerant 2.5V CMOS	1
SysErr	Set to 1 when a machine check is generated.	O	3.3V tolerant 2.5V CMOS	
SysReset	Main system reset. External logic can drive this bidirectional pin low (minimum of 16 cycles) to initiate a system reset. A system reset can also be initiated by software. Implemented as an open-drain output (two states; 0 or open circuit).	I/O	3.3V tolerant 2.5V CMOS	1, 2
Halt	Halt from external debugger.	I	3.3V LVTTTL Rcvr w/pull-up	
TmrClk	Processor timer external input clock.	I	3.3V LVTTTL	
GPIO00:15 GPIO22:23 GPIO26:48	General purpose I/O. To access these functions, software must set DCR register bits.	I/O	3.3V LVTTTL	1
GPIO16:21 GPIO24:25	General purpose I/O. To access these functions, software must set DCR register bits.	I/O	3.3V tolerant 2.5V CMOS	1
GPIO49:63	General purpose I/O. To access these functions, software must set DCR register bits.	I/O	3.3V tolerant 2.5V CMOS	
TestEn	Test Enable. Note: Do not connect for normal operation.	I	3.3V LVTTTL Rcvr w/pull-down	
RcvrInh	Receiver Inhibit. Active only when TestEn is active. Used for manufacturing test only.	I	3.3V LVTTTL	1
ModeCtrl	Mode Control. Active only when TestEn is active. Used for manufacturing test only.	I	3.3V tolerant 2.5V CMOS Rcvr	1
LeakTest LeakTest2	Leakage Test. Active only when TestEn is active. Used for manufacturing test only.	I	3.3V LVTTTL w/pull-up	1
RefEn	Reference Enable. Active only when TestEn is active. Used for manufacturing test only.	I	3.3V LVTTTL	1
DrvrInh1:2	Driver Inhibit. Active only when TestEn is active. Used for manufacturing test only.	I	3.3V LVTTTL w/pull-up	1
TherMonA:B	On-chip PNP thermal monitor transistor. A is the emitter and B is the base. The collector is grounded.	I	Thermal monitor	5
PSROut	Module characterization and screening. Use for test purposes only. Tie down as specified in Note 3 for normal operation.	O	Perf screen ring oscillator	1, 3

Table 8. Signal Functional Description (Sheet 9 of 9)

Notes:

1. Receiver input has hysteresis
2. Must pull up (recommended value is 3k Ω to OV_{DD} (EOV_{DD} for Ethernet)
3. Must pull down (recommended value is 1k Ω)
4. If not used, must pull up (recommended value is 3k Ω to OV_{DD} (EOV_{DD} for Ethernet)
5. If not used, must pull down (recommended value is 1k Ω)
6. Strapping input during reset; pull-up or pull-down required

Signal Name	Description	I/O	Type	Notes
Trace Interface				
TrcBS0:2	Trace branch execution status.	I/O	3.3V tolerant 2.5V CMOS	
TrcClk	Trace data capture clock, runs at 1/4 the frequency of the processor.	O	3.3V tolerant 2.5V CMOS	
TrcES0:4	Trace Execution Status is presented every fourth processor clock cycle.	I/O	3.3V tolerant 2.5V CMOS	
TrcTS0:6	Additional information on trace execution and branch status.	I/O	3.3V tolerant 2.5V CMOS	
Power				
V _{DD}	+1.5V—Logic voltage.	n/a	n/a	
OV _{DD}	+3.3V—I/O (except DDR2 SDRAM and Ethernet).	n/a	n/a	
EOV _{DD}	+2.5V—I/O Ethernet.	n/a	n/a	
SOV _{DD}	+1.8V (DDR2) or +2.5V (DDR1)—I/O DDR SDRAM.	n/a	n/a	
GND	Ground for logic and I/O voltage.	n/a	n/a	
AV _{DD}	+1.5V—Filtered voltage for system PLLs (analog).	n/a	n/a	
AGND	Ground for system PLL voltage (analog).	n/a	n/a	
EAV _{DD}	+1.5V—Filtered voltage for Ethernet PLLs (analog).	n/a	n/a	
EAGND	Ground for Ethernet PLL voltage (analog).	n/a	n/a	
U1AV _{DD}	+3.3V—Filtered voltage for USB PLL (analog). Connect to OV _{DD} .	n/a	n/a	
U2AV _{DD}	+3.3V—Filtered voltage for USB PHY (analog). Connect to OV _{DD} .	n/a	n/a	
U1AGND	Ground for USB PLL (analog) voltage. Connect to GND.	n/a	n/a	
U2AGND	Ground for USB PHY (analog) voltage. Connect to GND.	n/a	n/a	

Data Sheet**Device Characteristics****Table 9. Absolute Maximum Ratings**

The absolute maximum ratings below are stress ratings only. Operation at or beyond these maximum ratings can cause permanent damage to the device. None of the performance specification contained in this document are guaranteed when operating at these maximum ratings.

Characteristic	Symbol	Value	Unit	Notes
Internal logic supply voltage	V_{DD}	0 to +1.65	V	1
I/O supply voltage	OV_{DD}	0 to +3.6	V	1
Ethernet I/O supply voltage	EOV_{DD}	0 to +2.7	V	1
DDR2 (DDR1) SDRAM I/O supply voltage	SOV_{DD}	0 to +1.94 (+2.7V)	V	1
System analog supply voltage	AV_{DD}	0 to +1.65	V	
Ethernet analog supply voltage	EAV_{DD}	0 to +1.65	V	
USB PLL analog supply voltage	$U1AV_{DD}$	0 to +3.6	V	
USB PHY analog supply voltage	$U2AV_{DD}$	0 to +3.6	V	
Storage Temperature Range	T_{STG}	-55 to +150	°C	
Case temperature under bias	T_C	-40 to +120	°C	2

Notes:

1. If $OV_{DD} \leq 0.4V$, it is required that $V_{DD} \leq 0.4V$. Supply excursions not meeting this criteria must be limited to less than 25ms duration during each power up or power down event.
2. This value is not a specification of the operational temperature range, it is a stress rating only.

Table 10. Recommended DC Operating Conditions (Sheet 1 of 2)

Device operation beyond the conditions specified is not recommended. Extended operation beyond the recommended conditions can affect device reliability.

Parameter	Symbol	Minimum	Typical	Maximum	Unit	Notes
Logic Supply Voltage	V_{DD}	+1.425	+1.5	+1.6	V	4
I/O Supply Voltage	OV_{DD}	+3.15	+3.3	+3.45	V	4
Ethernet I/O Supply Voltage	EOV_{DD}	+2.4	+2.5	+2.6	V	4
DDR2 (DDR1) SDRAM I/O Supply Voltage	SOV_{DD}	+1.7 (+2.4)	+1.8 (+2.5)	+1.9 (+2.6)	V	4
System Analog Supply Voltages	AV_{DD}	+1.425	+1.5	+1.6	V	3, 4
Ethernet Analog Voltage	EAV_{DD}	+1.425	+1.5	+1.6	V	3, 4
USB Analog Voltages	$UnAV_{DD}$	+3.15	+3.3	+3.45	V	3, 4
DDR2 (DDR1) SDRAM Reference Voltage	SV_{REF}	+0.85 (+1.19)	+0.9 (+1.25)	+0.95 (+1.31)	V	2

Table 10. Recommended DC Operating Conditions (Sheet 2 of 2)

Device operation beyond the conditions specified is not recommended. Extended operation beyond the recommended conditions can affect device reliability.

Parameter	Symbol	Minimum	Typical	Maximum	Unit	Notes
Input Logic High 3.3V PCI	V_{IH}	$0.5OV_{DD}$		$OV_{DD}+0.5$	V	1
Input Logic High 3.3V LVTTTL		+2.0		+3.6	V	
Input Logic High 2.5V CMOS, 3.3V tolerant		+1.7		+3.6	V	
Input Logic High 1.8V DDR2 (2.5V DDR1)		$SV_{REF} + 0.125 (0.15)$		2.2 (3.0)	V	
Input Logic Low 3.3V PCI	V_{IL}	-0.5		$0.35OV_{DD}$	V	1
Input Logic Low 3.3V LVTTTL		0		+0.8	V	
Input Logic Low 2.5V CMOS		0		+0.7	V	
Input Logic Low 1.8V DDR2 (2.5V DDR1)		-0.3 (-0.3)		$SV_{REF} - 0.125 (0.15)$	V	
Output Logic High 3.3V PCI	V_{OH}	$0.9OV_{DD}$		-	V	1
Output Logic High 3.3V LVTTTL		+2.4		+3.6	V	
Output Logic High 2.5V CMOS		+2.0		+2.7	V	
Output Logic High 1.8V DDR2 (2.5V DDR1)		+0.95 (+1.7)		+1.95 (+2.7)	V	5
Output Logic Low 3.3V PCI	V_{OL}	-		$0.1OV_{DD}$	V	1
Output Logic Low 3.3V LVTTTL		0		+0.4	V	
Output Logic Low 2.5V CMOS		0		+0.4	V	
Output Logic Low 1.8V DDR2 (2.5V DDR1)		0		+0.43 (+0.54)	V	5
Input Leakage Current (no pull-up or pull-down)	I_{IL1}	0		0	μA	
Input Leakage Current for pull-down	I_{IL2}	0 (LPDL)		200 (MPUL)	μA	
Input Leakage Current for pull-up	I_{IL3}	-150 (LPDL)		0 (MPUL)	μA	
Input Max Allowable Overshoot 3.3V LVTTTL	V_{IMAO}			+3.9	V	
Input Max Allowable Undershoot 3.3V LVTTTL	V_{IMAU}	-0.6			V	
Output Max Allowable Overshoot 3.3V LVTTTL	V_{OMAO}			+3.9	V	
Output Max Allowable Undershoot 3.3V LVTTTL	V_{OMAU3}	-0.6			V	
Case Temperature	T_C	-40		+100	$^{\circ}C$	6

Notes:

1. PCI drivers meet PCI specifications.
2. $SV_{REF} = SOV_{DD}/2$. $SOV_{DD} = +1.8V$ for DDR2 memory or $+2.5V$ for DDR1 memory.
3. The analog voltages used for the on-chip PLLs can be derived from the logic voltage, but must be filtered before entering the PPC440EPx. See "Absolute Maximum Ratings" on page 65.
4. Startup sequencing of the power supply voltages is not required. A power-down cycle must complete (OV_{DD} and V_{DD} are below +0.4V) before a new power-up cycle is started
5. At $I_{OH} = I_{OL} = 10ma$.
6. Case temperature, T_C , is measured at top center of case surface with device soldered to a circuit board.

Data Sheet

Table 11. Input Capacitance

Parameter	Symbol	Maximum	Unit	Notes
2.5V/1.8V DDR	C_{IN1}	2.9	pF	
3.3V LVTTTL	C_{IN2}	2.1	pF	
PCI	C_{IN3}	2.5	pF	
3.3V tolerant CMOS	C_{IN5}	2.4	pF	
USB	C_{IN6}	3.0	pF	

Figure 4. Overshoot Waveform

Table 12. Overshoot and Undershoot

Receiver	AC Overshoot (V)	DC Overshoot (V)	DC Undershoot (V)	AC Undershoot (V)	T_{OS}
3.3V LVTTTL	3.9	3.6	0	-0.6	$0.1 * T_{CYC}^1$
2.5V (3.3V tolerant)	3.9	3.6	0	-0.6	$0.1 * T_{CYC}^1$
DDR	$1.2 * SOV_{DD}$	$SOV_{DD} + 0.3$	0	-0.6	$0.1 / MemClkOut$
PCI	$1.2 * OV_{DD}$	$OV_{DD} + 0.5$	0	$-0.2 * OV_{DD}$	$0.1 / PCIClk$

Notes:

- T_{CYC} is the period of the bus clock.
 - 1/PerClk - EBC and NAND flash interfaces.
 - 1/GMCRXClk - GMII and MII mode
 - 1/SMIIRefClk - SMII mode
 - 1/GMCOORxClk and 1/GMC1RxClk - RGMII mode
 - 1/USB2Clk - UTMI
 - 1/TrcClk - instruction trace interface
 - 1/IIC0Clk and 1/IIC1Clk - IIC interfaces
 - 1/SPIClkOut - SPI

Power Sequencing

Startup sequencing of the power supply voltages is not required. However, a power-down cycle must complete (OV_{DD} and V_{DD} are below +0.4V) before a new power-up cycle is started.

Analog Voltage Filter

The analog voltages (AV_{dd} , EAV_{dd} , and $UnAV_{dd}$) used for the on-chip PLLs can be derived from the logic voltage, but must be filtered before the PPC440EPx. A Separate filter, as shown below, is recommended for each voltage.

- The filter should keep the analog voltage to analog ground compression/expansion due to noise less than ± 50 mV.
- Keep all wire lengths as short as possible.
- Analog grounds must be brought out and connected to the digital ground plane at the filter capacitor.
- The impedance of the ferrite bead should be much greater than that of the capacitor at frequencies where noise is expected.

L – SMT ferrite bead chip, Murata BLM21PG600SN1
 C – 0.1 μ F ceramic dielectric

Table 13. Typical DC Power Supply Requirements Using DDR2 Memory

Frequency (MHz)	+1.5V Supply ($V_{DD}+AV_{DD}+EAV_{DD}$)	+1.8V Supply (SOV_{DD})	+2.5V Supply (EOV_{DD})	+3.3V Supply ($OV_{DD}+UAV_{DD}$)	Total	Unit	Notes
400	1.61	0.35	0.28	0.2	2.44	W	1
533	1.82	0.36	0.28	0.2	2.66	W	1
667	2.16	0.37	0.28	0.2	3.01	W	1

Notes:

1. Typical power is measured and is based on a nominal voltage of $V_{DD} = +1.5V$, $T_C = 100^\circ C$, while running Linux and a test application that exercises each function with representative traffic.

Table 14. Typical DC Power Supply Requirements Using DDR1 Memory

Frequency (MHz)	+1.5V Supply ($V_{DD}+AV_{DD}+EAV_{DD}$)	+1.8V Supply (SOV_{DD})	+2.5V Supply ($SOV_{DD} + EOV_{DD}$)	+3.3V Supply ($OV_{DD}+UAV_{DD}$)	Total	Unit	Notes
400	1.69	na	1.33	0.2	3.22	W	1
533	1.88	na	1.35	0.2	3.43	W	1
667	2.20	na	1.37	0.2	3.77	W	1

Notes:

1. Typical power is measured and is based on a nominal voltage of $V_{DD} = +1.5V$, $T_C = 100^\circ C$, while running Linux and a test application that exercises each function with representative traffic.

Data SheetTable 15. V_{DD} Supply Power Dissipation

Frequency (MHz)	+1.425V	+1.5V	+1.6V	Unit	Notes
400	1.49	1.69	2.00	W	1
533	1.64	1.88	2.21	W	1
667	1.94	2.20	2.78	W	1

Notes:

- Power is measured and is based on V_{DD} specified in the table and $T_C = 100^\circ\text{C}$, while running Linux and a test application that exercises each function with representative traffic.

Table 16. DC Power Supply Loads

Parameter	Symbol	Typical ⁴	Maximum ⁵	Unit	Notes
V_{DD} (+1.5V) active operating current	I_{DD}	1575	3350	mA	
OV_{DD} (+3.3V) active operating current	I_{ODD}	60	70	mA	
EOV_{DD} (+2.5V) active operating current	I_{EODD}	115	120	mA	
SOV_{DD} (+1.8V) DDR2 active operating current ²	I_{SODD2}	210	300	mA	
SOV_{DD} (+2.5V) DDR1 active operating current ²	I_{SODD1}	440	450	mA	
AV_{DD} (+1.5V) input current ¹	I_{ADD}	20	30	mA	
EAV_{DD} (+1.5V) active operating current	I_{EADD}	20	30	mA	1
$UnAV_{DD}$ (+3.3V) active operating current	I_{UADD}	90	110	mA	1

Notes:

- See "Absolute Maximum Ratings" on page 65 for filter recommendations.
- SOV_{DD} will be either +2.5V or +1.8V but not both.
- The maximum current values listed above are not guaranteed to be the highest obtainable. These values are dependent on many factors including the type of applications running, clock rates, use of internal functional capabilities, external interface usage, case temperature, and the power supply voltages. Your specific application can produce significantly different results. V_{DD} (logic) current and power are primarily dependent on the applications running and the use of internal chip functions (DMA, PCI, Ethernet, and so on). OV_{DD} (I/O) current and power are primarily dependent on the capacitive loading, frequency, and utilization of the external buses.
- Typical current is estimated at 667MHz with $V_{DD} = +1.5\text{V}$, $OV_{DD} = +3.3\text{V}$, $EOV_{DD} = +2.5\text{V}$, $SOV_{DD} = +2.5\text{V}$ (DDR1) or +1.8V (DDR2), and $T_C = +100^\circ\text{C}$ with a typical process.
- Maximum current is measured at 667MHz with $V_{DD} = +1.6\text{V}$, $OV_{DD} = +3.45\text{V}$, $EOV_{DD} = +2.6\text{V}$, $SOV_{DD} = +2.6\text{V}$ (DDR1) or +1.9V (DDR2), and $T_C = +100^\circ\text{C}$, and best-case process (which drives worst-case power).

Table 17. Package Thermal Specifications

Thermal resistance values for the TE-PBGA package in a convection environment at 6.3W are as follows:

Parameter	Symbol	Airflow ft/min (m/sec)						Unit	Notes
		0 (0)	100 (0.51)	200 (1.02)	300 (1.53)	400 (2.04)	500 (2.55)		
Junction-to-ambient thermal resistance without heat sink	θ_{JA}	13.1	11.7	10.9	10.5	10.3	10	°C/W	5
Junction-to-ambient thermal resistance with heat sink	θ_{JA}	11.1	8.2	7.2	6.8	6.6	6.3	°C/W	5, 6
		Resistance Value							
Junction-to-case thermal resistance	θ_{JC}	3.5						°C/W	5
Junction-to-board thermal resistance	θ_{JB}	7.3						°C/W	5

Notes:

1. Case temperature, T_C , is measured at top center of case surface with device soldered to circuit board.
2. $T_A = T_C - P \times \theta_{CA}$, where T_A is ambient temperature and P is power consumption.
3. $T_{CMax} = T_{JMax} - P \times \theta_{JC}$, where T_{JMax} is maximum junction temperature (+125°C) and P is power consumption.
4. The preceding equations assume that the chip is mounted on a board with at least one signal and two power planes.
5. Values in the table were achieved using a JEDEC standard board with the following characteristics: 114.5mm x 101.6mm x 1.6mm, 4 layers. The board has 100 thermal vias (same as the number of thermal balls on the TE-PBGA package).
6. Values for an attached heat sink were achieved with a 35mm x 35mm x 15mm unit (see Thermal Management below), attached with a 0.1mm thickness of adhesive having a thermal conductivity of 1.3W/mK.

Thermal Management

The following heat sink was used in the above thermal analysis:
ALPHA LPD35-15B (35mm x 35mm x15mm)

The heat sink is manufactured by:
Alpha Novatech, Inc. (www.alphanovatech.com)
473 Sapena Court, #12
Santa Clara, CA 95054
Phone: 408-567-8082

Data Sheet

Thermal Monitor

Thermal monitoring of the chip is accomplished using the PNP transistor ($\beta \approx 2$) provided on the chip. The collector of the transistor is connected to ground (GND). The emitter (TherMonA) and base (TherMonB) are connected to chip pins. A voltage measurement (V_{BE1} and V_{BE2}) across the TherMonA and TherMonB pins at the two current values I_1 and I_2 provides the chip temperature in °K according to the equation:

$$T = (q/nk)(V_{BE2} - V_{BE1}) / \ln(I_2/I_1) \text{ } ^\circ\text{K} \quad \text{where } q = 1.602 \ 176 \ 53 \times 10^{-19}, n = 1.0 \pm 0.015, \text{ and } k = 1.380 \ 6505 \times 10^{-23}.$$

Note: V_{BE2} and V_{BE1} should be specified in Volts. I_1 and I_2 can be any units of measure provided they are the same. The small values require precision measurement and current sources.

The calculated on chip (ball to ball) series resistance for the PPC440EPx thermal monitor circuit is 2.0 ohms. The thermal sensor reflects the PPC440EPx junction temperature.

Note: The bias voltage V_{EB} should be between +0.5V and +0.7V.

Test Conditions

Clock timing and switching characteristics are specified in accordance with operating conditions shown in *Table 10* on page 65. AC specifications are characterized with $V_{DD} = +1.5V$, $T_C = +85^\circ\text{C}$ and a 50pF test load as shown in the figure to the right.

Table 18. Clocking Specifications

Symbol	Parameter	Min	Max	Units	Notes
SysClk Input					
F_C	Frequency	33.33	66.66	MHz	1
T_C	Period	15	30	ns	
T_{CS}	Edge stability (cycle-to-cycle jitter)	–	± 0.15	ns	2
T_{CH}	High time	40% of nominal period	60% of nominal period	ns	
T_{CL}	Low time	40% of nominal period	60% of nominal period	ns	
Note: Input rising and falling edge slew rate $\geq 1V/ns$					3
TrcClk Output					
F_C	Frequency	CPU $F_C/4$	CPU $F_C/4$		
PLL VCO					
F_C	Frequency	600	1333.33	MHz	
T_C	Period	0.750	1.66	ns	

Table 18. Clocking Specifications (continued)

Symbol	Parameter	Min	Max	Units	Notes
Processor (CPU) Clock					
F_C	Frequency	333.33	666.66	MHz	
T_C	Period	1.5	3	ns	
MemClkOut and PLB Clock					
F_C	Frequency	133.33	166.66	MHz	
T_C	Period	6	7.5	ns	
T_{CH}	High time	45% of nominal period	55% of nominal period	ns	
MAL Clock					
F_C	Frequency	45	83.33	MHz	
T_C	Period	12	22.2	ns	

Note:

1. SysClk supports spread spectrum clocking with a -1% down-spread and a 40 kHz or less modulation frequency. For a 33.33MHz minimum SysClk, the modulation frequency range of 33.00 MHz to 33.33 MHz is supported.
2. The maximum input cycle-to-cycle jitter is ± 100 ps within the frequency range 100 kHz to 20 MHz. Outside the frequency range of 100 kHz to 20 MHz, the maximum input cycle-to-cycle jitter is ± 150 ps.
3. Slew rate is measured between 0.7V and 1.7V.

Figure 5. Timing Waveform

Note: SysClk and GMClk are 2.5V (3.3V tolerant). Slew rate should be measured between 0.7V and 1.7V.

Spread Spectrum Clocking

Care must be taken when using a spread spectrum clock generator (SSCG) with the PPC440EPx. This controller uses a PLL for clock generation inside the chip. The accuracy with which the PLL follows the SSCG is referred to as tracking skew. The PLL bandwidth and phase angle determine how much tracking skew there is between the SSCG and the PLL for a given frequency deviation and modulation frequency. When using an SSCG with the PPC440EPx the following conditions must be met:

- The frequency deviation must not violate the minimum clock cycle time. Therefore, when operating the PPC440EPx with one or more internal clocks at their maximum supported frequency, the SSCG can only lower the frequency.
- The maximum frequency deviation of SysClk cannot exceed –1%, and the modulation frequency cannot exceed 40kHz. In some cases, on-board PPC440EPx peripherals impose more stringent requirements.

Notes:

1. The serial port baud rates are synchronous to the modulated clock. The serial port has a tolerance of approximately 1.5% on baud rate before framing errors begin to occur. The 1.5% tolerance assumes that the connected device is running at precise baud rates.
2. Ethernet operation is unaffected.
3. IIC operation is unaffected.

Important: It is up to the system designer to ensure that any SSCG used with the PPC440EPx meets the above requirements and does not adversely affect other aspects of the system.

I/O Specifications

Table 19. Peripheral Interface Clock Timings (Sheet 1 of 3)

Parameter	Min	Max	Units	Notes
PCIClk frequency (asynchronous mode)	–	66.66	MHz	
PCIClk period (asynchronous mode)	15	–	ns

GMCRefClk Slew Rate	2	–	V/ns	2

Data Sheet

Table 19. Peripheral Interface Clock Timings (Sheet 2 of 3)

Parameter	Min	Max	Units	Notes
PerClk (and OPB Clock) frequency (for ext. master or sync. slaves)	33.33MHz	83.33	MHz	
PerClk period	12	30	ns	
PerClk high time	50% of nominal period	66% of nominal period	ns	
PerClk low time	33% of nominal period	50% of nominal period	ns	
UARTSerClk frequency	–	$1000 / (2T_{OPB}^1 + 2ns)$	MHz	1
UARTSerClk period	$2T_{OPB}^1 + 2$	–	ns	1
UARTSerClk high time	$T_{OPB}^1 + 1$	–	ns	1
UARTSerClk low time	$T_{OPB}^1 + 1$	–	ns	1
USB2Clk frequency	60	60	MHz	3
USB2Clk period	16.66	16.66	ns	3
USB2XtalIn/USB2XtalOut frequency	12	48	MHz	3
USB2XtalIn/USB2XtalOut period	20.8	83.33	ns	3
USB2XtalIn/USB2XtalOut high time	40% of nominal period	60% of nominal period	ns	
USB2XtalIn/USB2XtalOut low time	40% of nominal period	60% of nominal period	ns	

Table 19. Peripheral Interface Clock Timings (Sheet 3 of 3)

Parameter	Min	Max	Units	Notes
TmrClk frequency	–	100	MHz	
TmrClk period	10	–	ns	
TmrClk high time	40% of nominal period	60% of nominal period	ns	
TmrClk low time	40% of nominal period	60% of nominal period	ns	

Notes:

1. T_{OPB} is the period in ns of the OPB clock. The internal OPB clock runs at 1/2 the frequency of the PLB clock. The maximum OPB clock frequency is 83 MHz.
2. An internal PLL improves this duty cycle to a worst case of 48% minimum, 52% maximum.
3. Crystals, external clocks, or external oscillators must have a maximum tolerance of ±100ppm and maximum jitter of ±100ps. Only a frequencies of 48MHz is allowed for oscillators; only a frequencies of 48MHz is allowed for crystals. Crystals and oscillators should be connected as shown below:

Crystal – Frequency: 48MHz
 Resonance mode: parallel
 C_O: 15–30pF
 ESR: 20-60Ω
 Drive level: 50–500μW

$C = 2(C_L - C_{Stray})$ where

C_L is the load capacitance required by the crystal for oscillation

C_{Stray} is the board parasitic capacitance

DDR2/1 SDRAM I/O Specifications

The DDR2/1 SDRAM controller times its operation using the internal PLB clock signal and generates MemClkOut from the PLB clock. The PLB clock is an internal signal that cannot be directly observed. However, MemClkOut is the same frequency as the PLB clock signal and is in phase with the PLB clock signal. The phase skew between MemClkOut and the PLB clock is affected by the loading on MemClkOut.

Read capture logic in the DDR controller captures read data using a delayed version of DQS and internally re-synchronizes the data to the PLB clock. The PPC440EPx contains three independently programmable digital delay lines (DLLs) that control the timing of the indicated signals in read and write operations:

1. DQS (with respect to MemClkOut) for write operations.
2. MemData, ECC, and DM (with respect to MemClkOut) for write operations.
3. DQS (with respect to inbound MemData) for read operations.

There is also a master delay line for calibration. Programming details can be found in the *PPC440EPx Embedded Processor Users Manual*.

The signals are terminated as indicated in *Figure 9* for the DDR timing data in the following sections.

The PPC440EPx uses a clock forwarding scheme in which it drives the clock to the memory devices.

Data signals are divided into eight subgroups—one for each byte lane (see *Table 27* on page 87)—plus a ninth subgroup for the ECC byte lane. These signals include MemData00:63, DQS0:8, DM0:8, and ECC0:7 signals. Signals within a data subgroup (byte lane) should be routed together.

Command Bus Operation

The command bus (MemAddr, $\overline{\text{RAS}}$, $\overline{\text{CAS}}$, $\overline{\text{WE}}$, BA, ClkEn, BankSel, MemODT) is driven 180° out-of-phase with MemClkOut, and has no corresponding delay line. Therefore, board designers must consider two different types of systems: 1) registered DIMMs and 2) unbuffered DIMMs. The system clocking design must also be considered. To avoid crosstalk, the command bus signals and the data signals should not be routed together.

Board Layout Restrictions

The paths (traces) for the data and the associated data strobe signal should be routed with the same length between the PPC440EPx and the SDRAM devices, allowing the rising and falling edges of the strobe to arrive at the capture logic at the same time the data is in transition. All of the following timing assumes a trace velocity of 167ps/in.

Board designs must meet the following criteria:

- Skew on the signals in any byte lane should not exceed 50ps (0.3 in).
- Data subgroup trace lengths must be no more than 5in. (800ps) and have a difference of no more than 2.5in. (400ps).
- Byte lane subgroup trace length must be no less than 1.25in. (209ps).

For example, traces that average 3.00in. in length and 167ps/in., and meet the maximum 50ps skew requirement, would have a maximum length difference of 0.3in. So, they would be between 2.85in. and 3.15in. in length.

If the above timing recommendations are followed, the package wire bond lengths can be ignored.

Clocking

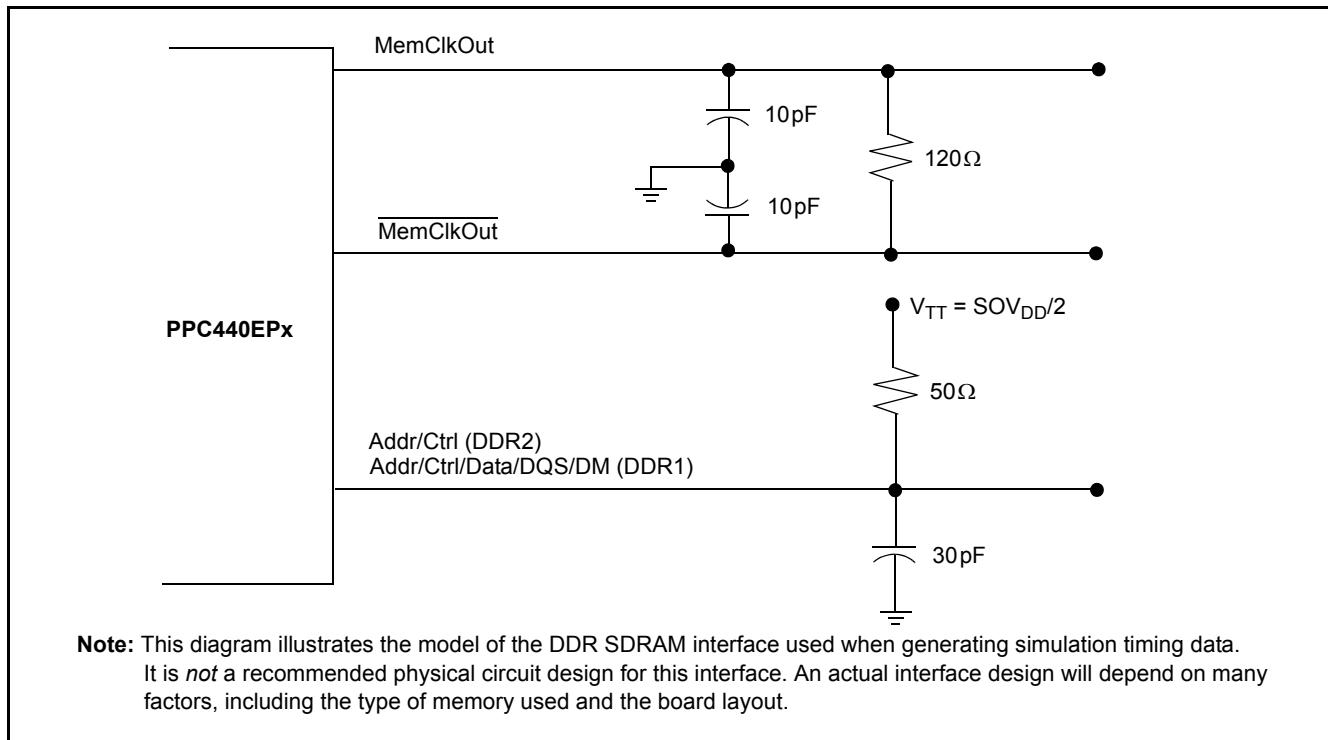

Clocking skew to all DRAMs must be minimized. The maximum allowed is considered to be 10ps. Because of the stringent requirements on DDR device clock inputs, it is expected that board designers will use some type of external PLL suitable to redrive the clock to the DDR SDRAMs. In such a system, the PLL acts like a zero-delay

insertion buffer.

When using unbuffered DIMMS, the loading on the address bus will be considerably greater than the clock (up to 18 loads for double-sided DIMMs). In this case, it is strongly suggested that a delay of 500ps in the clock path so that the Address/Command setup time at the DIMMs can be met. This delay is sufficient to meet the setup time, without having to change the programmable delay (internal to the PPC440EPx) between the DQS/DQ/DM and the clock (assuming nominal settings as specified in the PPC440EPx Users Manual). While the clock is now 500ps later than the nominal DQS arrival time, this still falls well within the window allowed by the JEDEC spec for T_{DQSS} (± 0.25 cycle, or 1.5ns at 166MHz). In the case where it is not possible to anticipate which kind of DIMMs may be employed in a system, it is always safe to use this 500ps clock delay, since registered DIMMs (the least heavily loaded) will have more than enough margin (almost 1/2 cycle) to accommodate the slight decrease in address hold time.

Termination Model

Figure 9. DDR SDRAM Simulation Signal Termination Model

DDR2 SDRAM On-Die Termination Impedance Setting

For all DDR2 applications, the On-Die Termination (ODT) impedance value *must* be set to 75 ohms in the DIMM Extended Mode Register (EMR) in order to optimize the data transmission during memory write operations.

Data Sheet

Table 23. DDR SDRAM Output Driver Specifications

Signal Path	Output Current (mA)	
	I/O H (maximum)	I/O L (maximum)
Write Data		
MemData00:63	10	10

DQS0:8	10	10
MemODT0:1	10	10

DDR SDRAM Write Operation

The rising edge of MemClkOut aligns with the first rising edge of the DQS signal on writes. The following data is generated by means of simulation and includes logic, driver, package RLC, and lengths. Values are calculated over best case and worst case processes with speed, junction temperature, and voltage as follows:

Table 24. DDR SDRAM Write Operation Conditions

Case	Process Speed	Junction Temperature (°C)	Voltage (V)
Best	Fast	–40	+1.6
Worst	Slow	+125	+1.425

Note: In the following tables and timing diagrams, minimum values are measured under best case conditions and maximum values are measured under worst case conditions. The timing numbers in the following sections are obtained using a simulation that assumes a model as shown in *Figure 9*.

The following diagram illustrates the relationship among the signals involved with a DDR write operation.

Figure 10. DDR SDRAM Write Cycle Timing

Note: The timing data in the following tables is based on simulation runs using Einstimer.

Table 25. I/O Timing—DDR SDRAM T_{DS}

Notes:

1. All of the DQS signals are referenced to MemClkOut with the DQS delay line programmed to 1 cycle.
2. Clock speed is 166MHz.

Signal Name	T_{DS} (ns)	
	Minimum	Maximum
DQS0	-0.030	+0.650
DQS1	-0.030	+0.620
DQS2	-0.050	+0.580
DQS3	-0.110	+0.480
DQS4	-0.140	+0.410
DQS5	-0.120	+0.480
DQS6	-0.060	+0.580
DQS7	-0.010	+0.690
DQS8	-0.140	+0.420

Data SheetTable 26. I/O Timing—DDR SDRAM T_{SK} , T_{SA} , and T_{HA} **Notes:**

1. Clock speed is 166MHz. T_{SK} is referenced to MemClkOut falling edge. T_{SA} and T_{HA} are referenced to MemClkOut rising edge.
2. The timing in this table assumes a single registered DIMM load on the outputs. To adjust the timing for unbuffered DIMMs, use the following values by subtracting them from T_{SA} and adding them to T_{SK} and T_{HA} :
 - 5 loads adjust by 0.41 ns
 - 9 loads adjust by 1.12 ns
 - 18 loads adjust by 2.12 ns
3. To obtain adjusted T_{SA} values for lower clock frequencies, use 1/2 of the cycle time for the lower clock frequency and subtract T_{SK} maximum ($0.5T_{CYC} - T_{SKmax}$).
4. To obtain adjusted T_{HA} values for lower clock frequencies, use 1/2 of the cycle time for the lower clock frequency and add T_{SK} minimum ($0.5T_{CYC} + T_{SKmin}$).

Signal Name	T_{SK} (ns)		T_{SA} (ns)	T_{HA} (ns)
	Minimum	Maximum	Minimum	Minimum
MemAddr00:13	-0.960	-0.270	3.27	2.04
BA0:2				
BankSel0:1				
ClkEn				
CAS				
RAS				
WE				

Table 27. I/O Timing—DDR SDRAM T_{SD} and T_{HD} **Notes:**

1. T_{SD} and T_{HD} are measured under worst case conditions.
2. Clock speed for the values in the table is 166MHz.
3. The time values in the table include 1/4 of a cycle at 166MHz ($6ns \times 0.25 = 1.5 ns$).
4. To obtain adjusted T_{SD} and T_{HD} values for lower clock frequencies, subtract 1.5 ns from the values in the table and add 1/4 of the cycle time for the lower clock frequency (for example, $T_{SD} - 1.5 + 0.25T_{CYC}$).

Signal Names	Reference Signal	T_{SD} (ns)	T_{HD} (ns)
MemData00:07, DM0	DQS0	1.37	1.23
MemData08:15, DM1	DQS1	1.41	1.18
MemData16:23, DM2	DQS2	1.40	1.17
MemData24:31, DM3	DQS3	1.41	1.20
MemData32:39, DM4	DQS4	1.45	1.18
MemData40:47, DM5	DQS5	1.40	1.18
MemData48:55, DM6	DQS6	1.46	1.17
MemData56:63, DM7	DQS7	1.45	1.10
ECC0:7, DM8	DQS8	1.46	1.18

DDR SDRAM Read Operation

The read data capture logic is responsible for capturing the data outputs from the SDRAM devices and passing the data back to the system clock domain. The data strobe signal (DQS) signals used to capture data are delayed to ensure that the rising and falling edges of these strobes are in the middle of the valid window of data.

DDR devices send a DQS coincident with the read data so that the data can be reliably captured by the PPC440EPx. The edges of these strobe signals are aligned with the data output by the SDRAM devices.

In order to reliably latch the data into a synchronizing FIFO, the PPC440EPx produces an internal, delayed version of DQS. The amount of delay is user programmable. In the example shown in *Figure 11*, the delay is set to approximately 25% of the system clock. A delay compensation circuit in the PPC440EPx keeps this delay

constant.

Figure 11. DDR SDRAM DQS Read Timing

Data Sheet**Boot Configuration**

The PPC440EPx supports several configurable boot parameters that must be initialized prior to booting. These parameters are configured by one of several default boot options or programmed by data read from an IIC serial EEPROM (see “Serial EEPROM” below). Strap signals sampled during reset select which method is used to initialize the boot parameters (see “Strapping” below).

Strapping

The Bootstrap Controller selects the boot options based on the state of the strap signals during reset. The strap signals are sampled on the rising edge of SysClk while SysReset(overbar) is driven low. They must not change state until after SysReset(overbar) is driven high in order to guarantee the correct boot option is selected.

These pins are used for strap functions only during reset. Following reset, they are used for normal functions. The signal names assigned to the pins for normal operation are shown in parentheses following the pin number.

Note: To isolate the strapping pins, the ExReset(overbar) signal may be used as a buffer enable or multiplexer select.

The following table lists the strapping pins along with their functions and boot strap options:

Table 28. Strapping Pin Assignments

Function	Option	Pin Strapping		
		C28 (UART0_DCD)	C29 (UART0_DSR)	A29 (UART0_CTS)
Serial device is disabled. Each of the six options (A–F) is a combination of boot source, boot-source width, and clock frequency specifications. Refer to the IIC Bootstrap Controller chapter in the <i>PPC440EPx Embedded Processor User's Manual</i> for details.	A ¹	0	0	0
	B ¹	0	0	1
	C	0	1	0
	D ¹	0	1	1
	E ¹	1	0	0
	F	1	1	0
Serial device is enabled. The option being selected is the IIC0 slave address that will respond with strapping data.	G (0xA8)	1	0	1
	H (0xA4)	1	1	1

1. Bootstrap options A, B, D, and E result in a PLL Forward Divisor B setting such that Forward Divisor B output frequency exceeds the CPU clock frequency. Following a power up, system reset or chip reset (when CPR0_ICFG[RLI] = 0), FWDVB and PRBDV0 must be re-programmed as documented in the *PowerPC 440EPx/GRx Embedded Processor User's Manual* in the Bootstrap Options section. The dividers must be re-programmed before the DDR is tuned such that the output of PLL Forward Divisor B does not exceed the CPU clock frequency.

Serial EEPROM

Boot Options G and H enable the Bootstrap Controller to read 16 bytes of configuration data from a serial EEPROM attached to the IIC0 bus after SysReset(overbar) de-asserts. The Bootstrap Controller stores the data in the SDR0_SDSTP0:3 registers.

Note: The IIC serial EEPROM must have a one-byte base address. Multi-byte base addresses are not supported.

The initialization settings and their default values are covered in detail in the *PowerPC 440EPx/GRx Embedded Processor User's Manual*.

Revision Log

Date	Version	Contents of Modification
06/01/2005		Initial creation of document.
06/03/2005		Add "Preliminary—Subject to Change" watermark.
07/06/2005		Change maximum NAND Flash to 256MB.
08/29/2005		Update with signal-to-pin assignment and I/O circuit type specifications.
09/12/2005		Replace existing DDR SDRAM information with new DDR2 SDRAM information.
10/03/2005		Implement updates from the 09/12 review.
10/05/2005		Misc. updates.
11/14/2005	1.07	Correct MemClkOut duty cycle. Correct description and move PerErr signal from master to slave. Change maximum VCO frequency to 1334MHz.
03/01/2006	1.08	Update corporate address and copyright date Update available Ethernet interface configurations (no RMII).
03/15/2006	1.09	Add four peripheral data parity signals. Change multiplexing of six GPIO signals. Update DDR2 SDRAM data. Adjust all other I/O timing.
04/05/2006	1.10	Misc. updates. Remove Confidential status. Correct OPB bridge information.
04/24/2006	1.11	Misc. updates. Correct security function designation. Add new power and current values.
05/12/2006	1.12	Misc. updates. Remove data for 333MHz CPU speed. Change all GPIOxx signals from alternate to primary. Change UART designations to eliminate letter designations B, C, D.
05/15/2006	1.13	Misc. updates.
05/30/2006	1.14	Correct list containing balls by ball number. Update power and temperature data. Add clocking information. Update EEPROM.
07/12/2006	1.15	Memory address corrections.
07/19/2006	1.16	Change and delete incorrect MemClkEn references. Correct enable/disable specifications for PCI Gnt/Req signals.
11/02/2006	1.17	Change USB2Rext pull-down from 2.4kΩ to 3.4kΩ Change analog voltage filter circuit inductor part number. Switch multiplex defaults for PerData16:31 from the USB signals to the PerData signals. Correct I/O designation for some Ethernet signals. Add thermal monitor information. Provide corrected and additional information on USB crystal/oscillator inputs. Remove leaded PNs.

Data Sheet

Date	Version	Contents of Modification
12/28/2006	1.18	Indicate that two USB analog voltages are needed with separate filters. Correct descriptions of LeakTest, RcvrInh, ModeCtrl, RefEn, and DrvrInh1:2 signals. Add information concerning address bus loading on DDR SDRAMs. Additions to information on USB crystal/oscillator inputs. Restore leaded PNs.
01/10/2007	1.19	Update DDR2/1 SDRAM timing and board design data.
02/01/2007	1.20	Update power data. Change V_{IL} .
03/12/2007	1.21	Change Typical Power on first page. Change V_{IL} back to what it was. Update package drawing with another view.
04/23/2007	1.22	Remove all valid USB oscillator and crystal frequencies except 48MHz.
07/18/2007	1.23	Added more information to the Thermal Monitor section.
08/06/2007	1.24	Changes to Figure 3.
08/24/2007	1.25	Added Assembly Recommendations, added Tables 3 and 4. Added recommendations for Unused I/O. Updated signal description in table 7 for signals SPCClkOUT, SCPDI, SCPDO, LeakTest and LeakTest2. Updated Table 19 to include reference clocks. Removed all references to TBI and RTBI as these modes are not supported due to errata: Chip_4 and Chip_5. Added voltage reference to Figures 4, 5, and 6 Corrected I/O comments for UART and Ethernet signals in Table 6. Removed Note 2 from Table 7 and added section on Analog Voltage Filter Added Figure and Table for Overshoot and Undershoot. Added section on Power Sequencing. Added slew rate and jitter requirements for GMCTxClk in Table 20. Added note in Strapping section Changed GPIO26[IIC0SData] to [GPIO26]IIC0SData. Added figures showing setup, hold, output valid and output hold timing for RGMII signals.
10/15/2007	1.26	Corrected telephone numbers on the last page. Corrected RGMII timing relative to GMCTxClk in table 21. Pull up recommendations to Table 9 for PCI signals.
01/07/2008	1.27	Correction to table 19 "GMCTxClk Period" unit column, changed MHz to ns. Corrected DC Overshoot in Overshoot. Added note for SMIISync signal to I/O Specification table. Added timing references to I/O Specification tables. Added an unused termination recommendation for Ethernet interfaces. Added TrcClk supported range to Clock Specification table. Remove tape and reel as a shipping option. Corrected GMCTxClk entry in Table 8 to indicate that it is an input.
03/18/2008	1.28	Replaced 16750 compatible UART to 16550 Replaced NS16750 with NS16550. Updated the DrvrInh1:2. Updated the Analog Voltage Filter from SAV_{DD} to EAV_{DD} and SAGND to EAGND Updated the RejectPkt0:1 note in table 8. Update to table 6 signals list: F02, AB33, and AL27
07/22/2008	1.29	Add JTAG timing specification to Table 20.

Date	Version	Contents of Modification
02/27/2009	1.30	<p>Doc Issue 5025: Added C value to filter AVdd circuit on page 68.</p> <p>Doc Issue 5172: Replaced Figure 8 with new RGMII timing figure. Removed former Figure 9. Added new Table 20 with RGMII I/O Timing data. Removed RGMII timing data from former Table 20 (is now Table 21).</p> <p>Doc Issue 5437: Update USB Host EHCI description to USB 2.0.</p> <p>Doc Issue 5632: Updated Boot Configuration, Strapping, and Serial EEPROM information on page 89.</p> <p>Doc Issue 5856: Added notes to Table 18 regarding Spread Spectrum, SysClk jitter, and slew rate.</p> <p>Doc Issue 5894: Removed "Preliminary".</p>
