## M54HC123

## RAD-HARD DUAL RETRIGGERABLE MONOSTABLE MULTIVIBRATOR

- HIGH SPEED: $\mathrm{t}_{\mathrm{PD}}=23 \mathrm{~ns}$ (TYP.) at $\mathrm{V}_{\mathrm{CC}}=6 \mathrm{~V}$
- LOW POWER DISSIPATION: STAND BY STATE:
$\mathrm{I}_{\mathrm{CC}}=4 \mu \mathrm{~A}$ (MAX.) at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$
ACTIVE STATE:
$\mathrm{I}_{\mathrm{CC}}=200 \mu \mathrm{~A}$ (MAX.) at $\mathrm{V}_{\mathrm{CC}}=5 \mathrm{~V}$
- HIGH NOISE IMMUNITY:
$\mathrm{V}_{\mathrm{NIH}}=\mathrm{V}_{\mathrm{NIL}}=28 \% \mathrm{~V}_{\mathrm{CC}}(\mathrm{MIN}$.
- SYMMETRICAL OUTPUT IMPEDANCE:
$\left|\mathrm{I}_{\mathrm{OH}}\right|=\mathrm{I}_{\mathrm{OL}}=4 \mathrm{~mA}(\mathrm{MIN})$
- BALANCED PROPAGATION DELAYS:
$\mathrm{t}_{\mathrm{PLH}} \cong \mathrm{t}_{\text {PHL }}$
- WIDE OPERATING VOLTAGE RANGE:
$\mathrm{V}_{\mathrm{CC}}(\mathrm{OPR})=2 \mathrm{~V}$ to 6 V
- WIDE OUTPUT PULSE WIDTH RANGE:
$\mathrm{t}_{\text {WOUT }}=120 \mathrm{~ns} \sim 60 \mathrm{~s}$ OVER AT $\mathrm{V}_{\mathrm{CC}}=4.5 \mathrm{~V}$
- PIN AND FUNCTION COMPATIBLE WITH 54 SERIES 123
- SPACE GRADE-1: ESA SCC QUALIFIED
- 50 krad QUALIFIED, 100 krad AVAILABLE ON REQUEST
- NO SEL UNDER HIGH LET HEAVY IONS IRRADIATION
- DEVICE FULLY COMPLIANT WITH SCC-9207-006

## DESCRIPTION

The M54HC123 is an high speed CMOS MONOSTABLE MULTIVIBRATOR fabricated with silicon gate $\mathrm{C}^{2} \mathrm{MOS}$ technology.
There are two trigger inputs, $\bar{A}$ INPUT (negative edge) and B INPUT (positive edge). These inputs

ORDER CODES

| PACKAGE | FM | EM |
| :---: | :---: | :---: |
| DILC | M54HC123D | M54HC123D1 |
| FPC | M54HC123K | M54HC123K1 |

are valid for slow rising/falling signals, ( $\mathrm{tr}=\mathrm{tf}=\mathrm{l} \mathrm{sec}$ ). The device may also be triggered by using the $\overline{C L R}$ input (positive-edge) because of the Schmitt-trigger input; after triggering the output maintains the MONOSTABLE state for the time period determined by the external resistor $\mathrm{R}_{\mathrm{X}}$ and capacitor $C_{X}$. When $C_{X} \geq 10 n F$ and $R_{X} \geq 10 K \Omega$, the output pulse width value is approximately given by the formula: $t_{W(O U T)}=K \cdot C_{x} \cdot R_{x}$.
( $\mathrm{K} \cong 0.45$ ).
Taking CLR low breaks this MONOSTABLE STATE. If the next trigger pulse occurs during the MONOSTABLE period it makes the MONOSTABLE period longer. Limit for values of $\mathrm{C}_{\mathrm{x}}$ and $\mathrm{R}_{\mathrm{x}}: \mathrm{C}_{\mathrm{x}}$ : NO LIMIT
$\mathrm{R}_{\mathrm{x}}: \mathrm{V}_{\mathrm{CC}}<3.0 \mathrm{~V} 5 \mathrm{~K} \Omega$ to $1 \mathrm{M} \Omega$
$\mathrm{V}_{\mathrm{CC}} \geq 3.0 \mathrm{~V} 1 \mathrm{~K} \Omega$ to $1 \mathrm{M} \Omega$
All inputs are equipped with protection circuits against static discharge and transient excess voltage.

SYSTEM DIAGRAM

This logic diagram has not be used to estimate propagation delays

TIMING CHART

## BLOCK DIAGRAM

1) Cx, Rx, Dx are external components
(2) $D x$ is a clamping diode.

The external capacitor is charged to Vcc in the stand-by-state, i.e. no trigger. When the supply voltage is turned off Cx is discharged mainly trough an internal parasitic diode (see figures). If Cx is sufficiently large and Vcc decreases rapidly, there will be some possibility of damaging the I.C. with a surge current or latch-up. If the voltage supply filter capacitor is large enough and Vcc decrease slowly, the surge current is automatically limited and damage to the I.C. is avoided. The maximum forward current of the parasitic diode is approximately 20 mA . In cases where Cx is large the time taken for the supply voltage to fall to 0.4 Vcc can be calculated as follows:
$\mathrm{t}_{\mathrm{f}} \geq(\mathrm{Vcc}-0.7) \times \mathrm{Cx} / 20 \mathrm{~mA}$
In cases where $t_{f}$ is too short an external clamping diode is required to protect the I.C. from the surge current.

## FUNCTIONAL DESCRIPTION

## STAND-BY STATE

The external capacitor, Cx , is fully charged to $\mathrm{V}_{\mathrm{CC}}$ in the stand-by state. Hence, before triggering, transistor Qp and Qn (connected to the Rx/Cx node) are both turned-off. The two comparators that control the timing and the two reference voltage sources stop operating. The total supply current is therefore only leakage current.

## TRIGGER OPERATION

Triggering occurs when:
1 st) $A$ is "LOW" and $B$ has a falling edge;
2 nd) $B$ is "HIGH" and A has a rising edge;
3 rd ) A is "LOW" and B is HIGH and C 1 has a rising edge;
After the multivibrator has been retriggered comparator C1 and C2 start operating and Qn is turned on. Cx then discharges through Qn. The voltage at the node R/C external falls.
When it reaches $\mathrm{V}_{\text {REFL }}$ the output of comparator C 1 becomes low. This in turn reset the flip-flop and Qn is turned off.
At this point C 1 stops functioning but C 2 continues to operate.
The voltage at R/C external begins to rise with a time constant set by the external components Rx , Cx.

Triggering the multivibrator causes $Q$ to go high after internal delay due to the flip-flop and the gate. $Q$ remains high until the voltage at $R / C$ external rises again to $\mathrm{V}_{\mathrm{REFH}}$. At this point C 2
output goes low and O goes low. C2 stop operating. That means that after triggering when the voltage $R / C$ external returns to $\mathrm{V}_{\text {REFH }}$ the multivibrator has returned to its MONOSTABLE STATE. In the case where Rx . Cx are large enough and the discharge time of the capacitor and the delay time in the I.C. can be ignored, the width of the output pulse $t_{w(o u t)}$ is as follows:

$$
t_{W(O U T)}=0.45 \mathrm{Cx} \cdot R x
$$

RE - TRIGGERED OPERATION
When a second trigger pulse follows the first its effect will depend on the state of the multivibrator. If the capacitor Cx is being charged the voltage level of R/C external falls to $\mathrm{V}_{\text {REFL }}$ again and Q remains High i.e. the retrigger pulse arrives in a time shorter than the period Rx • Cx seconds, the capacitor charging time constant. If the second trigger pulse is very close to the initial trigger pulse it is ineffective; i.e. the second trigger must arrive in the capacitor discharge cycle to be ineffective; Hence the minimum time for a second trigger to be effective depends on $V_{C C}$ and $C x$

## RESET OPERATION

$C L$ is normally high. If $C L$ is low, the trigger is not effective because Q output goes low and trigger control flip-flop is reset.
Also transistor Op is turned on and Cx is charged quickly to $\mathrm{V}_{\mathrm{CC}}$. This means if $\mathrm{C}_{\mathrm{L}}$ input goes low the IC becomes waiting state both in operating and non operating state.

## ABSOLUTE MAXIMUM RATINGS

| Symbol | Parameter | Value | Unit |
| :---: | :--- | :---: | :---: |
| $\mathrm{V}_{\mathrm{CC}}$ | Supply Voltage | -0.5 to +7 | V |
| $\mathrm{~V}_{\mathrm{I}}$ | DC Input Voltage | -0.5 to $\mathrm{V}_{\mathrm{CC}}+0.5$ | V |
| $\mathrm{~V}_{\mathrm{O}}$ | DC Output Voltage | -0.5 to $\mathrm{V}_{\mathrm{CC}}+0.5$ | V |
| $\mathrm{I}_{\mathrm{IK}}$ | DC Input Diode Current | $\pm 20$ | mA |
| $\mathrm{I}_{\mathrm{OK}}$ | DC Output Diode Current | $\pm 20$ | mA |
| $\mathrm{I}_{\mathrm{O}}$ | DC Output Current | $\pm 25$ | mA |
| $\mathrm{I}_{\mathrm{CC}}$ or $\mathrm{I}_{\mathrm{GND}}$ | DC $\mathrm{V}_{\mathrm{CC}}$ or Ground Current | $\pm 50$ | mA |
| $\mathrm{P}_{\mathrm{D}}$ | Power Dissipation | 300 | mW |
| $\mathrm{~T}_{\text {stg }}$ | Storage Temperature | -65 to +150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\mathrm{L}}$ | Lead Temperature (10 sec) | 265 | ${ }^{\circ} \mathrm{C}$ |

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied

## RECOMMENDED OPERATING CONDITIONS

| Symbol | Parameter |  | Value | Unit |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\mathrm{CC}}$ | Supply Voltage |  | 2 to 6 | V |
| $V_{1}$ | Input Voltage |  | 0 to $\mathrm{V}_{\mathrm{CC}}$ | V |
| $\mathrm{V}_{\mathrm{O}}$ | Output Voltage |  | 0 to $\mathrm{V}_{\mathrm{CC}}$ | V |
| $\mathrm{T}_{\text {op }}$ | Operating Temperature |  | -55 to 125 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{t}_{\mathrm{r}}, \mathrm{t}_{\mathrm{f}}$ | Input Rise and Fall Time | $\mathrm{V}_{\mathrm{CC}}=2.0 \mathrm{~V}$ | 0 to 1000 | ns |
|  |  | $\mathrm{V}_{\mathrm{CC}}=4.5 \mathrm{~V}$ | 0 to 500 | ns |
|  |  | $\mathrm{V}_{\mathrm{CC}}=6.0 \mathrm{~V}$ | 0 to 400 | ns |
| Cx | External Capacitor |  | NO LIMITATION | pF |
| Rx | External Resistor | $\mathrm{V}_{\text {CC }}<3 \mathrm{~V}$ | 5 K to 1M | $\Omega$ |
|  |  | $\mathrm{V}_{\mathrm{CC}} \geq 3 \mathrm{~V}$ | 1 K to 1M |  |

The Maximum allowable values of $C x$ and $R x$ are a function of leakage of capacitor $C x$, the leakage of device and leakage due to the board layout and surface resistance. Susceptibility to externally induced noise may occur for $R x>1 \mathrm{M} \Omega$
