TA7318P

WIDE RANGE PEAK POWER METER DRIVER

- . Dynamic Range=40dB (Typ.)
- . With built-in two channels excellent in matching characteristics for stereo.
- . Wide range meter for the 1/4 root compression circuit.
- . Single and dual power supply operation.
- . Built-in Zener diode providing stable operation to variations in supply voltage (Zener voltage: ±8.5V)

MAXIMUM RATINGS (Ta=25°C)

CHARACTERISTIC	SYMBOL	RATING	UNIT	
Supply Current	ICC	20	mA	
Power Dissipation (Note)	PD	700	mW	
Operating Temperature	Topr	-25 ~ 75	°C	
Storage Temperature	Tstg	- 55 ~125	°c	

Note: Derated above Ta=25°C in the proportion of 7mW/°C

Unit in mm 230 MAX 0.25±0

Lead pitch is 254 and tolerance is ±0.25 against theoretical center of each lead that is obtained on the basis of No.1 lead.

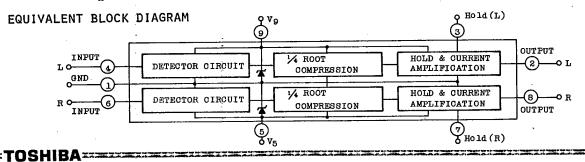

JEDEC TOSHIBA 89A-P

ELECTRICAL CHARACTERISTICS

 $(V_{CC}-V_{EE}=\pm 25V, Ta=25^{\circ}C, f=1kHz)$

CHARACTERISTIC	SYMBOL	TEST CIR- CUIT	TEST CONDITION	MIN.	TYP.	MAX.	UNIT
Quiescent Current	ICCQ	1	I _{IN} =0, V ₉ =7V, V ₅ =-7V	-	2.1	3.0	mA
Quiescent Output Current	IoQ	1	Input short	•	1	1	μA
Channel Balance	CH.B	1	I _{IN} =-100μA	-	-	1.4	dB
Input-Resistance	RIN	1	-	-	2	_	kΩ
Channel Separation	IOUT(sep)	1	I _{IN} =-1mA	_	-60	-	dB
Output Current	lour	1	I _{IN} =-100μΑ	1.6	2.1	2.6	mA
Min. Input Current	I _{IN} (Min)	1	-	-	7	-	μА
Max. Input Current	IIN (Max)	1	-	-	-	2	mA
Hold Terminal Voltage (Note)	v _H	2	Input short	25	_	150	mV

The hold terminal voltage is classified into two ranks as follows: $V_{H}-1$: 25 ~ 65mV, $V_{H}-2$: 45 ~ 150mV

TEST CIRCUIT 2.

APPLICATION CIRCUIT

1. APPLICATION TO POWER METER (Use of Dual-power supply)

2. USE OF SINGLE POWER SUPPLY

Power meter

Sensitivity: 1.1mA

Impedance: $1.5k\Omega$

C₁,C₂: Mylar film capacitor is used.

(Note) In case of using single power supply, the meter deflects the current charged to

C1 and C2 at power ON.

APPLICATION

1. DECISION OF R1(R2)

 $R_1(R_2)$ is a resistance that decides input current, by which the IC input is decided to be about lmA. For example, when full scale is 100W, if $R_L=8\Omega$ load, $R_1(R_2)$ is expressed as follows:

$$P_{OUT} = \frac{V^2 \text{ (V.rms)}}{R_L(8\Omega)}$$
 $V = \sqrt{P \times R_L} = \sqrt{100 \times 8} = 28.28 \text{Vrms}$

$$V_{IN} = 1mA \times R_1(R_2) = 28.28V$$

$$R_1(R_2) = 28.28k\Omega$$
 $27k\Omega$ is used for $R_1(R_2)$

2. DECISION OF R5(R6)

 $R_5(R_6)$ is a shunt resistance that decides angle of a meter, by which the meter is adjusted so as to become full scale when the IC input is lmA.

For example, when 1mA enters the input, the output is about. 4mA. (Refer to $I_{IN}-I_{OUT}$ characteristics shown in the attached sheet.) Therefore, if a meter of 1mA in meter sensitivity and $680\,\Omega$ in internal impedance is used, the following equation is expressed:

$$R_5(R_6) = \frac{680}{3} = 226.7 \div 220\Omega$$

Since $R_5(R_6)$ has meter variations, the use of variable resistance enables right and left adjustments to be made more easily.

D'

TA7318P

3. DECISION OF R3(R4)

 $R_3(R_4)$ is a resistance that decides supply current, by which pin 9 and pin 5 are fixed to GND (Pin 1) at $\pm 8.5 V$ respectively. Therefore, the value of $R_3(R_4)$ should be decided so that the current flown into IC by supply voltage may become $10 \text{mA} \sim 20 \text{mA}$.

For example, when $R_3(R_4)$ is used at V_{CC} = 25V and V_{EE} =-25V, if it has 10% sumply voltage variation, the following equation is obtained:

$$R_3(R_4) \ge \frac{25 \times 1.1 - 8.5V}{20mA} k\Omega = 0.95k\Omega$$

If $R_3(R_4)$ is $1k\Omega$, the supply current becomes 19mA.

In this case, if $R_3(R_4)$ is $1.2k\Omega$ by taking the power and variation into consideration, the supply current is expressed as follows:

$$I = \frac{25 - 8.5}{1.2k\Omega} = 13.8mA$$

Since $P=I^2R=13.82mA \times 1.2k\Omega \doteq 230mW$, the resistance of 1/4W type is sufficient. (Refer to $I_{CC}-I_{OUT}$ shown in the data sheet.)

4. DECISION OF C1(C2)

 $c_1(c_2)$ is a capacity that decides the recovery time of a meter. A capacitor to be used should be lower in variation; for example, it is recommended that mylar film capacitor be used. The capacitor is classified into two ranks according to recovery time variations.

The typical values are shown as follows: (The recovery time from $OdB \rightarrow -40dB$ is about. $2 \sim 4 sec.$)

Classification	C ₁ (C ₂)			
TA7318P-1	0.0068#F			
TA7318P-2	0.022µF			

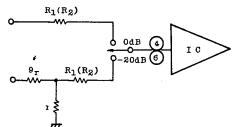

(Refer to $C_1(C_2)$ -TRECA shown in the data sheet.)

5. PRECAUTIONS AT TURN OF METER SENSITIVITY

When the signal scurce impedance $R_1(R_2)$ is remarkably changed, the variations in amplification at the time of small input to the meter are apt to generate; therefore, these variations must be attenuated without changing the impedance.

In this case, however, $r < R_1(R_2)$.

6. CONNECTION OF R1 AND R7 TO CIRCUIT WHICH RELAY IS USED FOR OUTPUT TERMINAL

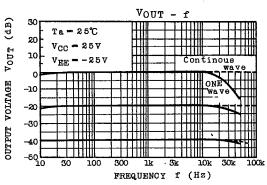

The resistance (R₇) should be inserted between input and ground as shown in the above figure. This is because the resistance prevents the ocurrence of such a phenomenon as, as long as the relay is turned OFF, the input impedance of TA7318P becomes high to be liable to receive the surrounding noise.

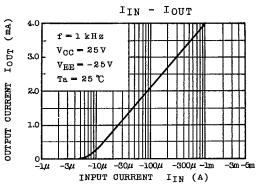

It is recommended that \mathbf{R}_1 and \mathbf{R}_7 be arranged close to the IC as far as possible.
