## 8-bit microcontroller with DTMF generator

## PCD3349A

**1 FEATURES**

- 8-bit CPU, ROM, RAM, I/O in a single 28-lead package
- 4-kbyte ROM
- 224-byte RAM
- Over 100 instructions (based on MAB8048) all of 1 or 2 cycles
- 20 quasi-bidirectional I/O port lines
- 8-bit programmable Timer/event counter 1
- 2 single-level vectored interrupts:
  - external
  - Timer/event counter 1
- Two test inputs, one of which also serves as the external interrupt input
- DTMF tone generator
- Reference for supply and temperature-independent TONE output
- Filtering for low output distortion (CEPT compatible)
- Power-on-reset
- Stop and Idle modes
- Supply voltage: 1.8 to 6 V (DTMF TONE output from 2.5 V)
- Low standby voltage of 1 V
- Low Stop mode current of 1  $\mu$ A (typical)
- Clock frequency: 1 to 16 MHz (3.58 MHz for DTMF suggested)
- Manufactured in silicon gate CMOS process.

**2 GENERAL DESCRIPTION**

The PCD3349A provides 4 kbytes of Program Memory, 224 bytes of RAM and 20 I/O lines.

The PCD3349A is a microcontroller which has been designed primarily for telecom applications. It includes an on-chip dual tone multi-frequency (DTMF) generator.

The instruction set is based on that of the MAB8048 and is software compatible with the PCD33xxA family.

This data sheet details the specific properties of the PCD3349A. The shared characteristics of the PCD33xxA family of microcontrollers are described in the "PCD33xxA Family" data sheet and also in "Data Handbook IC03; Section PCD33xxA Family", which should be read in conjunction with this publication.

**3 ORDERING INFORMATION**

TYPE NUMBER	PACKAGE		
	NAME	DESCRIPTION	VERSION

5 PINNING INFORMATION

5.1 Pinning

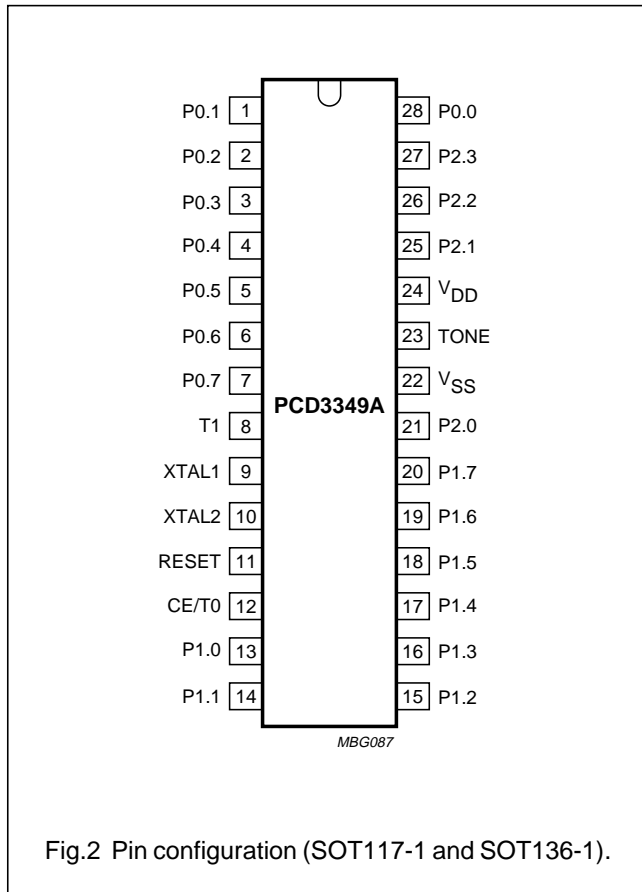

Fig.2 Pin configuration (SOT117-1 and SOT136-1).

5.2 Pin description

Table 1 SOT117-1 and SOT136-1 packages

SYMBOL	PIN	DESCRIPTION
P0.0 to P0.7	28, 1 to 7	Port 0: 8 quasi-bidirectional I/O lines
T1	8	Test 1 or count input of 8-bit Timer/event counter 1
XTAL1	9	crystal oscillator or external clock input
XTAL2	10	crystal oscillator output
RESET	11	reset input
CE/ $\overline{T0}$	12	Chip Enable or Test 0
P1.0 to P1.7	13 to 20	Port 1: 8 quasi-bidirectional I/O lines
P2.0 to P2.3	21, 25, 26, 27	Port 2: 4 quasi-bidirectional I/O lines
V <sub>SS</sub>	22	ground
TONE	23	DTMF output
V <sub>DD</sub>	24	positive supply voltage

8-bit microcontroller with DTMF generator

PCD3349A

6 FREQUENCY GENERATOR

A versatile frequency generator section is provided (see Fig.3). For normal operation, use a 3.58 MHz quartz crystal or PXE resonator. The frequency generator includes precision circuitry for dual tone multifrequency (DTMF) signals, which is typically used for tone dialling telephone sets.

The TONE output can alternatively issue twelve modem frequencies for data rates between 300 and 1200 bits/s.

In addition to DTMF and modem frequencies, two octaves of musical scale in steps of semitones are available.

6.1 Frequency generator derivative registers

Table 2 gives the derivative addresses, mnemonics and access types of the frequency generator derivative registers. The addresses 03H to FFH are not used.

Table 2 Addresses of the frequency generator derivative registers

ADDRESS	REGISTER	7	6	5	4	3	2	1	0
01H	HGF <sup>(1)</sup>	H7	H6	H5	H4	H3	H2	H1	H0
02H	LGF <sup>(2)</sup>	L7	L6	L5	L4	L3	L2	L1	L0

Notes

1. HGF = High Group Frequency; access type W.
2. LGF = Low Group Frequency; access type W.

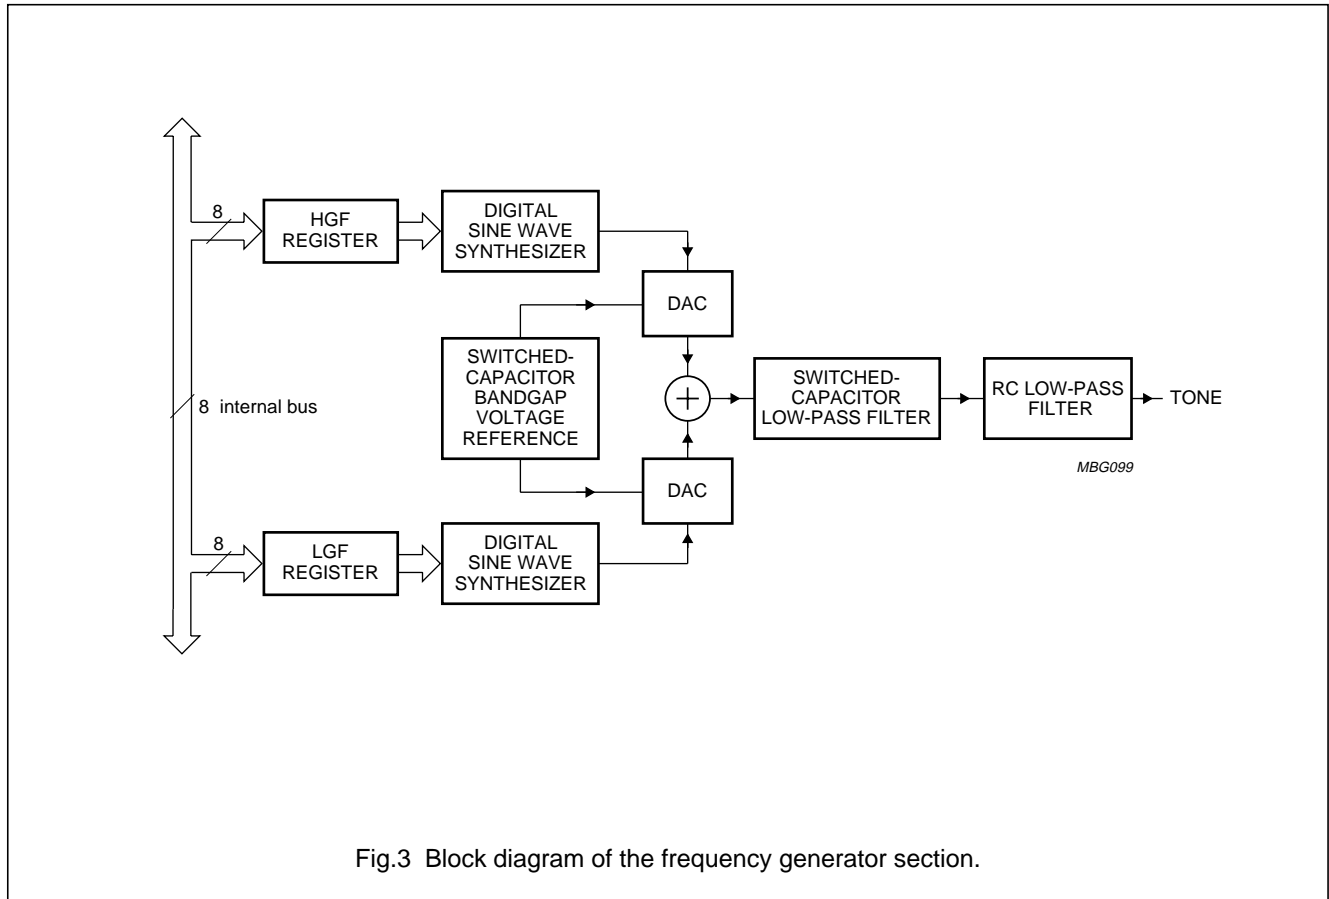

Fig.3 Block diagram of the frequency generator section.

## 8-bit microcontroller with DTMF generator

## PCD3349A

## 6.2 Frequency registers

The two frequency registers HGF and LGF define two frequencies. From these, the digital sine synthesizers together with the Digital-to-Analog Converters (DACs) construct two sine waves. Their amplitudes are precisely scaled according to the bandgap voltage reference. This ensures TONE output levels independent of supply voltage and temperature. The amplitude of the Low Group Frequency sine wave is attenuated by 2 dB compared to the amplitude of the High Group Frequency sine wave.

The two sine waves are summed and then filtered by an on-chip switched capacitor and RC low-pass filters. These guarantee that all DTMF tones generated fulfil the CEPT recommendations with respect to amplitude, frequency deviation, total harmonic distortion and suppression of unwanted frequency components.

The value 00H in a frequency register stops the corresponding digital sine synthesizer. If both frequency registers contain 00H, the whole frequency generator is shut off, resulting in lower power consumption.

The frequency of the sine wave generated is dependent upon the decimal value 'x' held in the frequency registers (HGF and LGF), and this may be calculated as follows:

$$f = \frac{f_{xtal}}{[23(x+2)]}; \text{ where } 60 \leq x \leq 255.$$

The frequency limitation given by  $x \geq 60$  is due to the low-pass filters which would attenuate higher frequency sine waves.

## 6.3 DTMF frequencies

Assuming an oscillator frequency  $f_{xtal} = 3.58$  MHz, the DTMF standard frequencies can be implemented as shown in Table 3.

The relationship between telephone keyboard symbols and the frequency register contents are given in Table 4.

**Table 3** DTMF standard frequencies and their implementation; value = LGF, HGF contents

VALUE (HEX)	FREQUENCY (Hz)		DEVIATION

## 8-bit microcontroller with DTMF generator

## PCD3349A

## 6.4 Modem frequencies

Again assuming an oscillator frequency  $f_{\text{xtal}} = 3.58$  MHz, the standard modem frequency pairs summarized in Table 5 can be implemented. It is suggested to define the frequency by the HGF register while the LGF register contains 00H, disabling Low Group Frequency generation.

**Table 5** Standard modem frequency pairs and their implementation

HGF VALUE (HEX)	FREQUENCY (Hz)		DEVIATION

## Notes

1. Standard is V.21.
2. Standard is Bell 103.
3. Standard is Bell 202.
4. Standard is V.23.

## 6.5 Musical scale frequencies

Finally, two octaves of musical scale in steps of semitones can be realized, again assuming an oscillator frequency  $f_{\text{xtal}} = 3.58$  MHz (Table 6). It is suggested to define the frequency by the HGF register while the LGF contains 00H, disabling Low Group Frequency generation.

**Table 6** Musical scale frequencies and their implementation

## 8-bit microcontroller with DTMF generator

## PCD3349A

**7 TIMING**

Although the PCD3349A operates over a clock frequency range from 1 to 16 MHz,  $f_{xtal} = 3.58$  MHz will usually be chosen to take full advantage of the frequency generator section.

**8 RESET**

In addition to the conditions given in the "PCD33xxA Family" data sheet, all derivative registers are cleared in the RESET state.

**9 STOP MODE**

Since the oscillator is switched off, the frequency generator receives no clock. It is suggested to clear both the HGF and LGF registers before entering Stop mode. This will cut-off the biasing of the internal amplifiers, considerably reducing current requirements.

**10 IDLE MODE**

In the Idle mode, the frequency generator remains operative.

**11 INSTRUCTION SET RESTRICTIONS**

Since no serial I/O interface is provided, the serial I/O (Input/Output) instructions are not available. 'MOV Dx, A' is the only applicable derivative instruction because the derivative registers are write-only.

ROM space being restricted to 4 kbytes, SEL MB2/3 would define non-existing Program Memory banks and should therefore be avoided.

RAM space being restricted to 224 bytes, care should be taken to avoid accesses to non-existing RAM locations.

**12 SUMMARY OF MASK OPTIONS****Table 7** Port mask options

PORT NAME	PORT OUTPUT DRIVE <sup>(1)</sup>			PORT STATE AFTER RESET <sup>(2)</sup>	
	OPTION 1	OPTION 2	OPTION 3	SET	RESET
Port 0 (P0.0 to P0.7)	X	X	X	X	X
Port 1 (P1.0 to P1.7)	X	X	X	X	X
Port 2 (P2.0 to P2.7)	X	X	X	X	X

**Notes**

- Port output drives:
  - Option 1: standard I/O.
  - Option 2: open-drain I/O.
  - Option 3: push-pull output; see "PCD33xxA Family" data sheet.
- Port state after reset: S = Set (HIGH) and R = Reset (LOW).

**Table 8** Mask options

FEATURE	DESCRIPTION
ROM code: program/data	Any mix of instructions and data up to ROM size of 4 kbytes.
Power-on-reset voltage level: $V_{POR}$	1.2 to 3.6 V in increments of 100 mV; OFF
Oscillator transconductance: $g_m$	LOW transconductance: $g_{mL}$
	MEDIUM transconductance: $g_{mM}$
	HIGH transconductance: $g_{mH}$

PCD3349A

**13 LIMITING VALUES**

In accordance with the Absolute Maximum Rating System (IEC 134); see note 1 and 2.

SYMBOL	PARAMETER	MIN.	MAX.	UNIT
$V_{DD}$	supply voltage	-0.5	+7.0	V
$V_I$	all input voltages	-0.5	$V_{DD} + 0.5$	V
$I_I, I_O$	DC input or output current	-10	+10	mA
$P_{tot}$	total power dissipation	-	125	mW
$P_O$	power dissipation per output	-	30	mW
$I_{SS}$	ground supply current	-50	+50	mA
$T_{stg}$	storage temperature	-65	+150	°C
$T_j$	operating junction temperature	-	90	°C

**Notes**

- Stresses above those listed under Limiting Values may cause permanent damage to the device.
- Parameters are valid over operating temperature range unless otherwise specified. All voltages are with respect to  $V_{SS}$  unless otherwise noted.

**14 HANDLING**

Inputs and outputs are protected against electrostatic discharge in normal handling. However, it is good practice to take normal precautions appropriate to handling MOS devices (see "Handling MOS devices").

**15 DC CHARACTERISTICS**

$V_{DD} = 1.8$  to  $6$  V;  $V_{SS} = 0$  V;  $T_{amb} = -25$  to  $+70$  °C; all voltages with respect to  $V_{SS}$ ;  $f_{xtal} = 3.58$  MHz ( $g_{mL}$ ); unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
<b>Supply</b> (see Figs 5 to 9)						
$V_{DD}$	supply voltage		1.8	-	6	V
	operating; note 1		1.0	-	6	V
$I_{DD}$	operating supply current; note 2	$V_{DD} = 3$ V; value HGF $\neq 0$ and/or LGF $\neq 0$	-	0.9	1.8	mA
		$V_{DD} = 3$ V	-	0.3	0.6	mA
		$V_{DD} = 5$ V; $f_{xtal} = 10$ MHz ( $g_{mL}$ )	-	1.1	3.0	mA
		$V_{DD} = 5$ V; $f_{xtal} = 16$ MHz ( $g_{mM}$ )	-	1.7	5.0	mA
		$V_{DD} = 5$ V; $f_{xtal} = 16$ MHz ( $g_{mH}$ )	-	2.5	6.0	mA
$I_{DD(idle)}$	supply current Idle mode; note 2	$V_{DD} = 3$ V; value HGF $\neq 0$ and/or LGF $\neq 0$	-	0.7	1.4	mA
		$V_{DD} = 3$ V; value HGF = LGF = 0	-	0.2	0.4	mA
		$V_{DD} = 5$ V; $f_{xtal} = 10$ MHz ( $g_{mL}$ )	-	0.8	1.6	mA
		$V_{DD} = 5$ V; $f_{xtal} = 16$ MHz ( $g_{mM}$ )	-	1.2	4.0	mA
		$V_{DD} = 5$ V; $f_{xtal} = 16$ MHz ( $g_{mH}$ )	-	1.7	5.0	mA
$I_{DD(stp)}$	supply current Stop mode	$V_{DD} = 1.8$ V; $T_{amb} = 25$ °C; note 3	-	1.0	2.5	$\mu$ A
		$V_{DD} = 1.8$ V; $T_{amb} = 70$ °C; note 3	-	-	10	$\mu$ A

## 8-bit microcontroller with DTMF generator

## PCD3349A

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
<b>Inputs</b>						
$V_{IL}$	LOW-level input voltage		0	–	$0.3V_{DD}$	V
$V_{IH}$	HIGH-level input voltage		$0.7V_{DD}$	–	$V_{DD}$	V
$I_{IL}$	input leakage current	$V_{SS} \leq V_I \leq V_{DD}$	–1	–	+1	$\mu\text{A}$
<b>Port outputs (see Figs 10 to 12)</b>						
$I_{OL}$	LOW-level port sink current	$V_{DD} = 3\text{ V}; V_O = 0.4\text{ V}$	0.7	3.5	–	mA
$I_{OH}$	HIGH-level port pull-up source current	$V_O = 2.7\text{ V}; V_{DD} = 3\text{ V}$	–10	–20	–	$\mu\text{A}$
		$V_O = 0\text{ V}; V_{DD} = 3\text{ V}$	–	–100	–300	$\mu\text{A}$
$I_{OH}$	HIGH-level port push-pull source current	$V_{DD} = 3\text{ V}; V_O = 2.6\text{ V}$	–0.7	–4	–	mA
<b>TONE output (see Fig.4; notes 1 and 4)</b>						
$V_{HG_{rms}}$	HGF voltage (RMS)		158	181	205	mV
$V_{LG_{rms}}$	LGF voltage (RMS)		125	142	160	mV
$\Delta f/f$	frequency deviation		–0.6	–	0.6	%
$V_{DC}$	DC voltage level		–	$0.5V_{DD}$	–	V
$ Z_O $	output impedance		–	100	500	$\Omega$
$V_G$	pre-emphasis of group		1.5	2.0	2.5	dB
THD	total harmonic distortion	$T_{amb} = 25\text{ }^\circ\text{C}; \text{note 5}$	–	25	–	dB
<b>Power-on-reset</b>						
$\Delta V_{POR}$	Power-on-reset level variation around chosen $V_{POR}$	note 6	–0.5	0	+0.5	V

**Notes**

1. TONE output requires  $V_{DD} \geq 2.5\text{ V}$ .
2.  $V_{IL} = V_{SS}$ ;  $V_{IH} = V_{DD}$ ; open-drain outputs connected to  $V_{SS}$ ; all other outputs open; value HGF = LGF = 0, unless otherwise specified.
3. Crystal connected between XTAL1 and XTAL2; pins T1 and  $\overline{CE/T0}$  at  $V_{SS}$ ; value HGF = LGF = 0.
4. Values are specified for DTMF frequencies only (CEPT).
5. Related to the Low Group Frequency (LGF) component (CEPT).
6.  $V_{POR}$  is an option chosen by the user. Depending on its value, it may restrict the supply voltage range.

## 8-bit microcontroller with DTMF generator

## PCD3349A

**18 SOLDERING****18.1 Introduction**

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"Data Handbook IC26; Integrated Circuit Packages"* (order code 9398 652 90011).

**18.2 DIP****18.2.1 SOLDERING BY DIPPING OR BY WAVE**

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ( $T_{stg\ max}$ ). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

**18.2.2 REPAIRING SOLDERED JOINTS**

Apply a low voltage soldering iron (less than 24 V) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

**18.3 SO****18.3.1 REFLOW SOLDERING**

Reflow soldering techniques are suitable for all SO packages.

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt. Dwell times vary between 50 and 300 seconds depending on heating method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 minutes at 45 °C.

**18.3.2 WAVE SOLDERING**

Wave soldering techniques can be used for all SO packages if the following conditions are observed:

- A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.
- The longitudinal axis of the package footprint must be parallel to the solder flow.
- The package footprint must incorporate solder thieves at the downstream end.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

**18.3.3 REPAIRING SOLDERED JOINTS**

Fix the component by first soldering two diagonally-opposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

## 8-bit microcontroller with DTMF generator

PCD3349A

**19 DEFINITIONS**

<b>Data sheet status</b>	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
<b>Limiting values</b>	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
<b>Application information</b>	
Where application information is given, it is advisory and does not form part of the specification.	

**20 LIFE SUPPORT APPLICATIONS**

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
