

■ General Description

The AME1505 is a 5A low-dropout positive voltage regulator. The dropout voltage of AME1505 is 750mV at maximum output current. The output voltage is preset at factory. It is available in fixed and adjustable output voltage versions. The fixed voltage range could expand from 1.25V to 3.7V, where 5V and 3.3V voltage supplies are available. AME1505 has 2 new features: First, a remote Sense pin is wired out to eliminate output voltage variation due to load changes. Secondly, an extra Control pin is available to effectively decrease Vin to Vo drop. It greatly improves the power dissipation.

Overcurrent and thermal protection are integrated onto the chip. Output current will limit as it reaches the pre-set current. AME1505 series have excellent regulation over line, load and temperature variations.

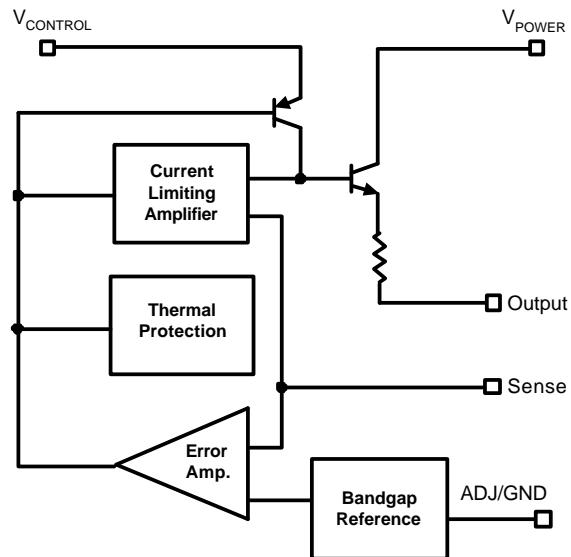

■ Features

- Low dropout voltage --- 750mV at 5A
- Adjustable or 1.25~3.7V fixed voltage
- Line regulation 3 mV maximum
- Load regulation 7mV maximum
- Adjust pin (ADJ) current less than 120 μ A
- Dual voltage supplies is recommended
- Overcurrent protection
- Available in TO-220-5, TO-263-5

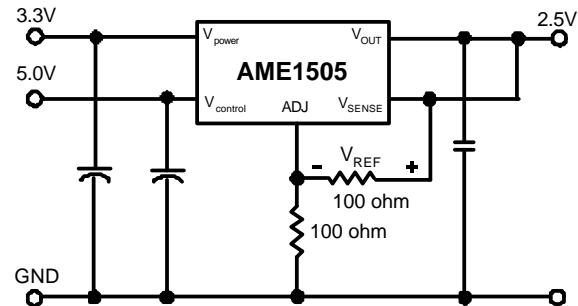

■ Applications

- VGA Card Supplies
- Post Regulators for Switching Supplies
- Microprocessor Supply
- Chipset Supplies
- LCD Monitor Power

Ripple rejection ratio	R_A	$V_{\text{CONTROL}} = V_{\text{POWER}} = V_o + 2.5\text{V}$, $V_{\text{RIPPLE}} = 1\text{V}_{\text{P-P}}$, $I_o = 2\text{A}$	60	80	-	dB

■ Application Description

1. Output voltage adjustment

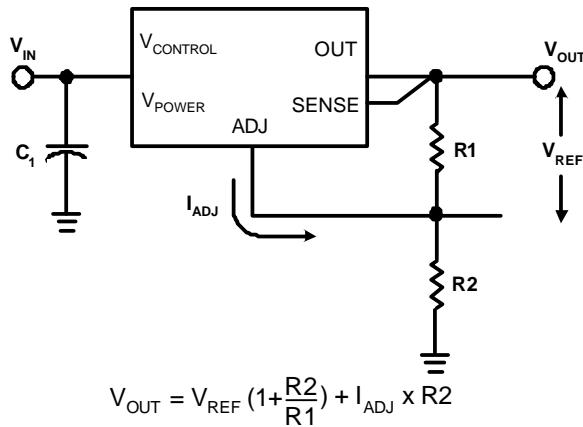

Like most regulators, the AME1505 regulates the output by comparing the output voltage to an internally generated reference voltage. On the adjustable version, the V_{REF} is available externally as 1.25V between V_{OUT} and ADJ. The voltage ratio formed by R1 and R2 should be set to conduct 10mA (minimum output load). The output voltage is given by the following equation:

$$V_{OUT} = V_{REF} \left(1 + \frac{R2}{R1} \right) + I_{ADJ} \times R2$$

On fixed versions of AME1505, the voltage divider is factory-preset internally.

2. Current limit protection

AME1505 is protected against overload conditions. Current protection is triggered at typical 7.5A.

3. Stability and load regulation

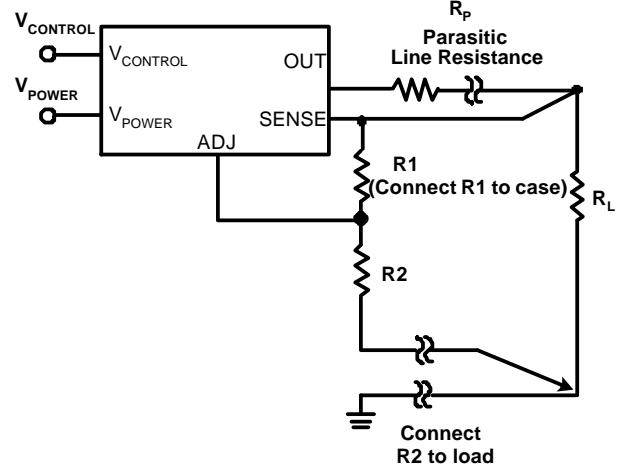

AME1505 requires a capacitor from V_{OUT} to GND to provide compensation feedback to the internal gain stage. This is to ensure stability at the output terminal. Typically, a 10 μ F tantalum or 50 μ F aluminum electrolytic is sufficient.

(Note: It is important that the ESR for this capacitor does not exceed 0.5W.)

The output capacitor dose not have a theoretical upper limit and increasing its value will increase stability. $C_{OUT} = 100\mu$ F or more is typical for high current regulator design.

For the adjustable version, the best load regulation is accomplished when the top of the resistor divider (R1) is connected directly to the output pin of the AME1505. When so connected, R_p is not multiplied by the divider ratio.

For fixed output versions, the top of R1 is internally connected to the output. The ground pin can be connected to low side of the load to eliminate ground loop errors.

AME1505

High Power BiPolar Linear LDO

4. Thermal consideration

The AME1505 series contain thermal limiting circuitry designed to protect itself for over-temperature conditions. Even for normal load conditions, maximum junction temperature ratings must not be exceeded. As mention in thermal protection section, we need to consider all sources of thermal resistance between junction and ambient. It includes junction-to-case, case-to-heat-sink interface and heat sink thermal resistance itself.

Junction-to-case thermal resistance is specified from the IC junction to the bottom of the case directly below the die. Proper mounting is required to ensure the best possible thermal flow from this area of the package to the heat sink. The case of all devices in this series is electrically connected to the output. Therefore, if the case of the device must be electrically isolated, a thermally conductive spacer is recommended.
