

TENTATIVE TOSHIBA BIPOLAR LINEAR INTEGRATED CIRCUIT SILICON MONOLITHIC

# TA1310N

## NTSC VIDEO, CHROMA, DEFLECTION, AND DEC. DISTORTION COMPENSATION IC (FOR YUV INTERFACE AND ACB WITH)

TA1310N is Video Chroma and deflection signal.  
Processing IC for NTSC. On a 56-pin shrink DIP package.  
TA1310N has deflection distortion compensation.  
TA1310N uses an I<sup>2</sup>C Bus controls for controllings and  
settings.

### FEATURES

#### Video Signal Processing

- Built-in Y delay line
- Black stretch
- DC restoration ratio compensation
- Aperture controlled sharpness
- Output for velocity scan modulation (VSM)
- White peak suppression (WPS)

#### Chroma Signal Processing

- Built-in chroma BPF/TOF
- R-Y and B-Y outputs
- Color/BW situation output by read bus

Weight : 5.55 g (Typ.)

980910EBA1

- TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.
- The products described in this document are subject to the foreign exchange and foreign trade laws.
- The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA CORPORATION for any infringements of intellectual property or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any intellectual property or other rights of TOSHIBA CORPORATION or others.
- The information contained herein is subject to change without notice.

**Sync Signal Processing**

- Counts down  $32 f_H$
- Dual AFC
- Vertical AGC
- HD and VD outputs
- Vertical frequency fixed mode
- Horizontal and Vertical position alignment
- DC outputs for vertical centering

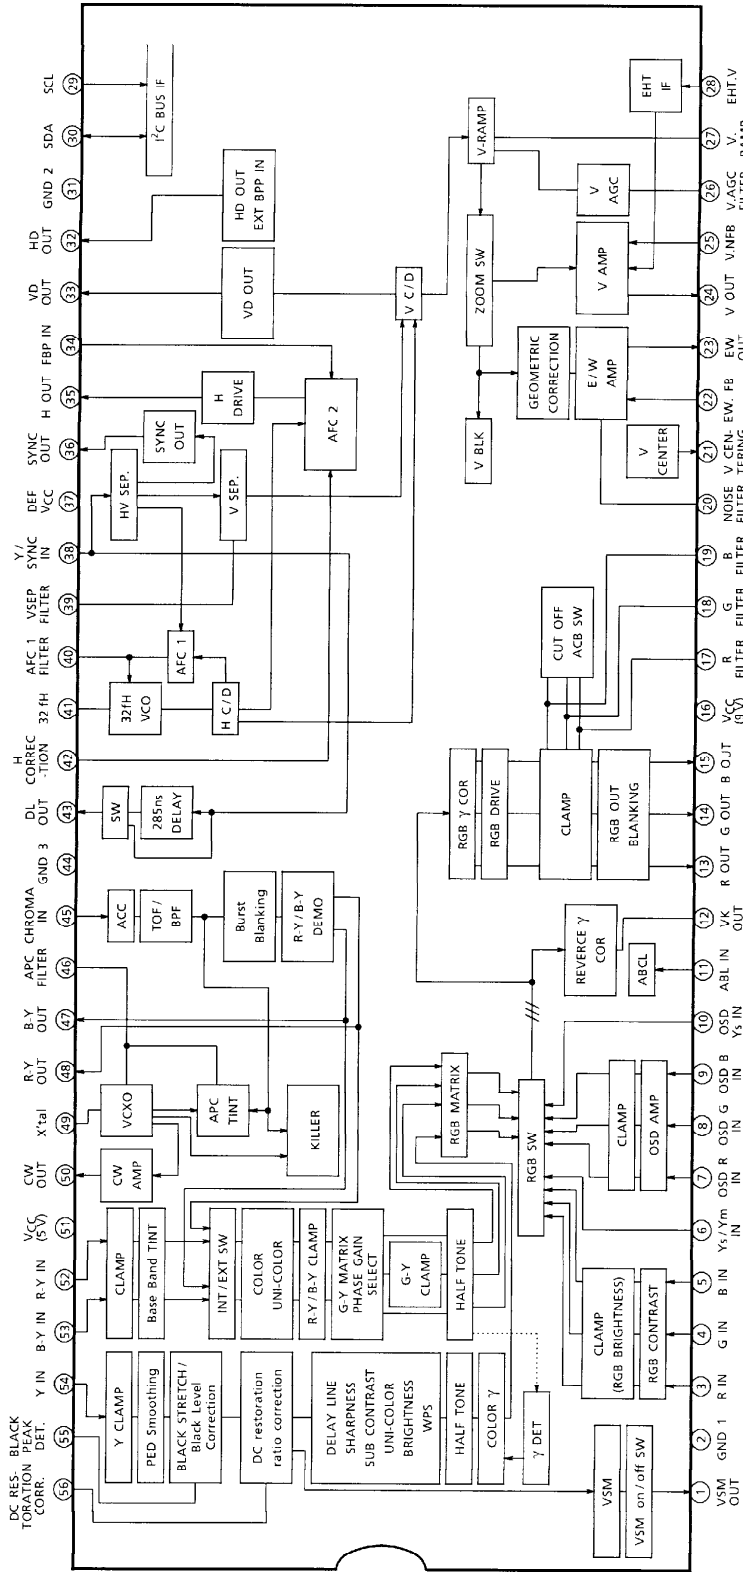

**Text Signal Processing**

- Analog RGB inputs
- Digital RGB inputs
- Halftone switch ( $Y_M$ )
- Cutoff and drive alignment
- YUV inputs

**Deflection Correction Function**

- Horizontal and Vertical amplitude adjustment
- Vertical linearity correction
- Vertical S correction
- Vertical EHT correction
- E/W parabola correction
- E/W corner correction
- E/W trapezium correction

BLOCK DIAGRAM

TA1310N-3

PIN FUNCTION

PIN No.	SYMBOL	FUNCTION	INTERFACE	I/O SIGNAL
1	VSM OUT	VSM means Verocity Scanning Modulation.	<p>4 MHz peak</p>	
2	GND I	The terminal for GND of Video / Y / TEXT circuits.	—	
3 4 5	RIN GIN BIN	The terminals for Analog RGB signal input. Input signals clamped by coupling capacitors. (*)Even when not in use, connect to GND with a coupling capacitor.	<p>Buffer Clamp</p>	<p>100 IRE = 0.5 V<sub>p-p</sub> 3.7 V</p>
6	Y <sub>S</sub> /Y <sub>M</sub> IN	The terminal for switching of Analog RGB Mode and Half tone.		<p>RGB 2.1 V Half Tone 0.7 V TV GND</p>
7 8 9	OSD R IN OSD G IN OSD B IN	The terminals for Analog OSD RGB signal input. Input signals clamped by coupling capacitors. (*)Even when not in use, connect to GND with a coupling capacitor.		<p>100 IRE = 1.25 V<sub>p-p</sub> 5.5 V</p>

PIN No.	SYMBOL	FUNCTION	INTERFACE	I/O SIGNAL
10	OSD Y <sub>S</sub> IN	The terminal for switching of internal RGB signals and Analog OSD RGB signals (Pin 7, 8, 9).		<p>Analog RGB 2.8 V</p> <p>Main GND</p>
11	ABL IN	The terminal for the external unicolor and brightness control. ABL Gain and ABL start point can be set by using BUS.		OPEN 6.0 V
12	VK OUT	The terminal outputs signal in order to input in H-correction (Pin 42). The signal corresponds to RGB signal.		
13 14 15	R OUT G OUT B OUT	The terminals for RGB signal output.		
16	V <sub>CC</sub> (9 V)	The terminal for V <sub>CC</sub> Supply 9 V. The terminals is connected to 9 V (typ.).	—	
17 18 19	R Filter G Filter B Filter	Control the RGB output cutoff voltage, holding the standard pulse period comparator output to one vertical period. For this control, use the bus function RGB cutoff. The filters must be low leakage current filters.		

PIN No.	SYMBOL	FUNCTION	INTERFACE	I/O SIGNAL
20	NOISE FILTER	Connect to GND with a 0.47- $\mu$ F coupling capacitor.		
21	V Centering	The terminal for the DAC output that controlled by BUS (V-center).		
22	EW FB	The terminal for E/W feedback.		
23	EW OUT	The terminal for output of E/W drive signal.		
24	V OUT	The terminal for output of Vertical drive signal.		
25	V NFB	The terminal for input of Vertical negative feedback. If input voltage is less than 2 V, V-Guard function works and blanks RGB signal output.		

PIN No.	SYMBOL	FUNCTION	INTERFACE	I/O SIGNAL
26	V AGC Filter	The terminal to be connected a capacitor for Automatic gain control of Vertical RAMP signal.		
27	V RAMP	The terminal to be connected a capacitor to generate Vertical RAMP signal.		
28	EHT V	The terminal for the Vertical EHT input.		
29	SCL	The terminal for input of I <sup>2</sup> C BUS clock.		
30	SDA	The terminal for input/output of I <sup>2</sup> C BUS data.		

PIN No.	SYMBOL	FUNCTION	INTERFACE	I/O SIGNAL
31	GND II	The terminal for the GND of DEF / I <sup>2</sup> C / EW.	—	
32	HD OUT	The terminal for the HD pulse. The suspension period of the Black peak stretching is extended by inputting the external pulse.		
33	VD OUT	The terminal for the VD pulse.		
34	FBP IN	The terminal for the flyback pulse to control H-BLK and H-AFC.		
35	H OUT	The terminal for the Horizontal output.		

PIN No.	SYMBOL	FUNCTION	INTERFACE	I/O SIGNAL
36	SYNC OUT	The terminal for output of the synchronizing signal that was separated in the synchronous separation circuit. This terminal is of the open collector system. Connect the pull-up resistor.		
37	DEF V <sub>CC</sub>	The terminal for V <sub>CC</sub> supply 9 V of DEF.	(Caution) Be sure to design the power supply so that when the power is Off, DEF V <sub>CC</sub> is below 1.9 V.	
38	Y/SYNC IN	The terminal for input of the synchronous separation circuit. Input via clamp capacitor.		
39	V SEP Filter	The terminal to be connected a capacitor for the Vertical synchronous separation circuit.		
40	AFC I Filter	Connect the filter for horizontal AFC I detection. The frequency of the horizontal output varies depending on the voltage at this pin.		

PIN No.	SYMBOL	FUNCTION	INTERFACE	I/O SIGNAL
41	32 fh VCO	Connect the ceramic oscillator for horizontal oscillation. The oscillator to be used is CSB503F30, made by Murata electronics.		
42	H Correction	The terminal to correct distortion of picture in the case of high-tension fluctuation. Input the AC component of high tension fluctuation. This terminal can be inputted VK output (Pin 12).		
43	DL OUT	The terminal outputs delayed Y signal. Input this signal to Y IN (Pin 54) via a capacitor.		
44	GND III	The terminal for GND of DEF linear / Chroma circuits.	—	
45	CHROMA IN	The terminal for the chroma input.		DC : 1.77 V AC : Burst 286 mV <sub>p-p</sub>

PIN No.	SYMBOL	FUNCTION	INTERFACE	I/O SIGNAL
46	APC	The terminal to be connected APC filter. The oscillation frequency of VCXO varies depending on the voltage at this pin.		
47	B-Y OUT	The terminal outputs the B-Y signal.		DC : 2.2 V AC : 300m V <sub>p-p</sub> (Rainbow color bar)
48	R-Y OUT	The terminal outputs the R-Y signal.		DC : 2.2 V AC : 300 mV <sub>p-p</sub> (Rainbow color bar)
49	X'tal	The terminal to be connected with a 3.579545 MHz X'tal oscillator. The oscillated frequency, $f_0$ , is controlled by series capacitors, and frequency adjustment range can be expanded by putting capacitors in parallel.		
50	CW OUT	The terminal for CW output generated in VCXO.		

PIN No.	SYMBOL	FUNCTION	INTERFACE	I/O SIGNAL
51	V <sub>CC</sub> (5 V)	The terminal for V <sub>CC</sub> supply 5 V.	—	
52 53	R-Y IN B-Y IN	The terminals for the R-Y/B-Y signal input. Input signals clamped by coupling capacitors.  (* )Even when not in use, connect to GND with a coupling capacitor.		
54	Y IN	The terminal for the Y signal input. Input the Y signals clamped by coupling capacitors.		
55	BLACK PEAK DET	The terminal to be connected the filter controlling the black stretching gain of the black stretching circuit. The black stretching gain varies depending on the voltage at this pin.		
56	DC RESTORATION CORR.	The terminal to be connected capacitor for DC restoration correction control. Open this pin if not use the DC restoration correction.

**I<sup>2</sup>C BUS COMMUNICATIONS, RECEIVE METHOD**

Start and stop condition

Bit transfer

Acknowledgement

Data receive format

When data are received, the master transmitter changes to a receiver immediately after the first acknowledgement and the slave receiver changes to a transmitter.

The master always creates the stop condition.

Details are provided in the Philips I<sup>2</sup>C specifications.

Option data transmit format

In the above method, the subaddresses are automatically incremented from the specified subaddress and data are set.

Purchase of TOSHIBA I<sup>2</sup>C components conveys license under the Philips I<sup>2</sup>C patent Rights to use these components in an I<sup>2</sup>C system, provided that the system conforms to the I<sup>2</sup>C standard specification as defined by Philips.

**MAXIMUM RATINGS** (Ta = 25°C)

CHARACTERISTICS	SYMBOL	RATING	UNIT

NOTE	ITEM	MEASUREMENT METHOD	
		SW MODE	SW45   SW46
C6	Color Difference Output Tint Adjustment Characteristics	B	ON
C7	Supply Voltage Dependence of Color Difference Output	B	ON
C8	Identification Sensitivity	B	ON
C9	Bus Read Identification	B	ON

(#16 V<sub>CC</sub> = 9 V, #37 V<sub>CC</sub> = 9 V, #51 V<sub>CC</sub> = 5 V, Ta = 25 ± 3°C)

**MEASUREMENT METHOD**

① Input a rainbow signal (signal C-1) to the chroma input pin (TP45).  
Burst : chroma = 300 mV<sub>p-p</sub> : 300 mV<sub>p-p</sub>

② Measure the demodulation angles  $\theta_{B'}$  and  $\theta_{R'}$  in the outputs with the tint set to the maximum (subaddress (03H), data (FE)). Calculate  $\theta_{Bmax}$  and  $\theta_{Rmax}$  by the following formulas.  

$$\theta_{Bmax} = \theta_{B'} - \theta_{Bcnt}$$

$$\theta_{Rmax} = \theta_{R'} - \theta_{Rcnt}$$

③ Measure the demodulation angles  $\theta_{B''}$  and  $\theta_{R''}$  in the outputs with the tint set to the minimum (subaddress (03H), data (00)). Calculate  $\theta_{Bmin}$  and  $\theta_{Rmin}$  by the following formulas.  

$$\theta_{Bmin} = \theta_{B''} - \theta_{Bcnt}$$

$$\theta_{Rmin} = \theta_{R''} - \theta_{Rcnt}$$

① Input a rainbow signal (signal C-1) to the chroma input pin (TP45).  
Burst : chroma = 300 mV<sub>p-p</sub> : 300 mV<sub>p-p</sub>

② As in C02, measure the amplitudes  $\Delta VBp$  and  $\Delta VRp$  of the B-Y output pin (TP47) and R-Y output pin (TP48) when the 5-V V<sub>CC</sub> is set to 5 V + 0.3 V. Calculate the amplitude ratios BVp and RVp when the 5-V V<sub>CC</sub> is set to 5 V.  

$$BVp = \frac{\Delta VBp - vB}{vB} \times 100 \quad RVp = \frac{\Delta VRp - vR}{vR} \times 100$$

③ Using the same tests as above, calculate BVn and RVn when the 5-V V<sub>CC</sub> is set to 5 V - 0.3 V  

$$BVn = \frac{\Delta VBn - vB}{vB} \times 100 \quad RVn = \frac{\Delta VRn - vR}{vR} \times 100$$

① Input a rainbow signal (signal C-1) to the chroma input pin (TP45).  
Burst : chroma = 1 : 1

② Gradually reduce the input signal amplitude from 100 mV<sub>p-p</sub>. When the B-Y output pin (TP47) signal disappears (when the current is DC), measure the input signal amplitude vCB.

③ Gradually increase the input signal amplitude from 0 mV<sub>p-p</sub>. When a demodulation signal appears on the B-Y output pin (TP47), measure the input signal amplitude vBC.

① Perform the same tests as above while observing the bus read : When the input signal amplitude is vCB, check that the first bit is set to 0 (bCB).  
When the input signal amplitude is vBC, check that the first bit is set to 1 (bBC).

(Note 1) : Where the bus data are not specified, set the preset values.

(Note 2) : Ensure the sync signal is always input to TP38 (SYNC IN).

T46	RGB $\gamma$ Correction Characteristics	A	A	A	OFF	A	A	A	OFF	A	OFF	A

① Set pin 17 to open, connect a 1-k $\Omega$  resistor to the pin, and apply 3V to the pin from the power supply.

② When the subaddress (11) data are set to (10), (30), (50), and (70), measure from the waveform of pin 17 the current flowing to GND during the clamp period. (I17a, I17b, I17c I17d)

③ Repeat the measurements in steps ① and ② above on pins 18 and 19. (I18a, I18b, I18c I18d) (I19a, I19b, I19c I19d)

① Input a ramp waveform to pin 54 (Y IN) and adjust the input amplitude so that the picture period amplitude of pin 13 is 2.5 V<sub>p-p</sub>.

② Adjust the drive adjustment data so that the picture period amplitudes of pins 14 and 15 are equal to that of pin 13.

③ Set the subaddress (13) data to (81).

④ Using pins 13, 14, and 15, calculate the RGB $\gamma$  start point and its gradient (in decibels) in relation to the off point, using Fig.1 below.

The graph plots Output amplitude (IRE) on the vertical axis against Input amplitude (IRE) on the horizontal axis. Both axes range from 0 to 100. A solid line represents the transfer characteristic, showing a linear relationship. A dashed line indicates a 2.5 V<sub>p-p</sub> signal level. Three points are marked on the line: .11, .12, and .13, corresponding to different subaddresses.

D30	Service Mode Switching	OFF	B	When the subaddress (0C) D <sub>0</sub> is set to (1), check that the #27 (V.Ramp) waveform is low (3.4 V DC).
D31	Vertical Pull-In Range	OFF	C	Input a composite video signal to TP38, vary the vertical frequency of this signal in 0.5-H steps, and measure the vertical pull-in range.
D32	Vertical Frequency Forced 263H	OFF	B	① Measure the number of H periods of #33 (HD out) when the subaddress (0D) D <sub>1</sub> and D <sub>0</sub> are set to (10). (f <sub>V1</sub> )
	Vertical Frequency Forced 262.5H	OFF	B	② Measure the number of H periods of #33 (HD out) when the subaddress (0D) D <sub>1</sub> and D <sub>0</sub> are set to (11). (f <sub>V2</sub> )
D33	Vertical Blanking Mode	OFF	B	Set the subaddress (01) D <sub>7</sub> to (1) and check that no vertical or horizontal blanking pulse is applied to #13 (R out), #14 (G out), or #15 (B out).

NOTE	ITEM	TEST CONDITIONS (DEF V <sub>CC</sub> = 9V, Ta = 25 ± 3°C, BUS DATA = POWER-ON RESET)	
		SW MODE	MEASUREMENT METHOD
D34	Vertical Output Pulse Width	SW <sub>34</sub> OFF	SW <sub>38</sub> C Input a composite video signal to TP38, then measure the #33 (VD out) vertical pulse delay T <sub>D</sub> and pulse width T <sub>W</sub> in relation to the vertical sync signal of #38 (sync in).
D35	RGB Output Vertical Blanking Pulse Start Phase RGB Output Vertical Blanking Pulse Stop Phase	OFF	C Input a composite video signal to TP38, then measure the #13 (R out) waveform phase difference VR <sub>51</sub> and pulse width VR <sub>52</sub> in relation to the #38 (Sync in) waveform. Repeat measurement on #14 and #15. Set the subaddress (11) D <sub>4</sub> ~D <sub>1</sub> to (1111) and the subaddress (12) D <sub>4</sub> ~D <sub>1</sub> to (1111).
D36	V Cycle Black Peak Detection Disable Pulse (Normal)	OFF	C Input a composite video signal to TP38 and measure the V cycle black peak detection disable pulse period of #55 (BLACK PEAK DET).
D37	V Cycle Black Peak Detection Disable Pulse (Zoom)	OFF	C Under the conditions in D38 above, set the subaddress (0C) D <sub>1</sub> to (1) and measure the V cycle black peak detection disable period of #55.
