

**LC89977M****CCD Delay Line for PAL****Preliminary****Overview**

The LC89977M is CCD delay line for PAL television system that includes a chrominance signal crosstalk exclusion filter and a luminance signal 1-H delay line on chip.

Features

- 5-V single-voltage power supply
- Built-in $3 \times$ PLL frequency multiplier circuit allows 3fsc operation from an fsc (4.43 MHz) input.
- Can be switched between the PAL/GBI, and 4.43NTSC formats by setting control pin values.
- Includes a built-in crosstalk exclusion comb filter for the chrominance signal that provides high-precision comb characteristics in an adjustment-free circuit.
- Peripheral circuits provided on chip for operation with a minimum of external components.
- Positive-phase signal input, positive-phase signal output (luminance signal)

Functions

- CCD shift registers (for chrominance and luminance signals)
- Timig generator and clock driver for CCD
- Delay time selective circuit
- CCD signal adder
- Auto-bias circuit
- Sync tip clamp circuit (luminance signal)
- Center bias circuit (chrominance signal)
- Sample-and-hold circuit
- $3 \times$ PLL frequency multiplier circuit
- 3fsc clock output circuit
- High voltage generator for CCD Reset Drain (RD)

Specifications**Absolute Maximum Ratings at $T_a = 25^\circ\text{C}$**

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage	V_{DD}		-0.3 to +6.0	V
Allowable power dissipation	$P_d \text{ max}$		250	mW
Operating temperature	T_{opr}		-10 to +60	$^\circ\text{C}$
Storage temperature	T_{stg}		-55 to +125	$^\circ\text{C}$

Package Dimensions

unit: mm

LC89977M

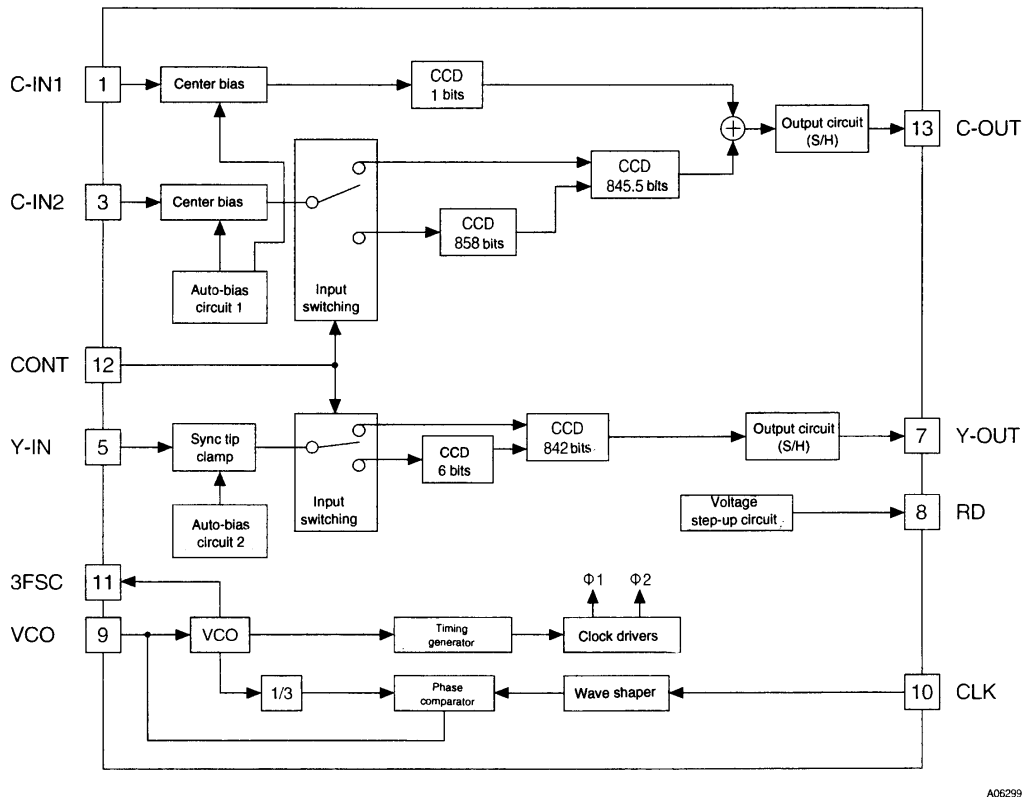

Allowable Operating Ranges at Ta = 25°C

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
Supply voltage	V _{DD}		4.75	5.00	5.25	V
Clock input amplitude	V _{CLK}		300	500	1000	mVp-p
Clock frequency	F _{CLK}	Sine wave		4.43361875		MHz
Chrominance signal input amplitude	V _{IN-C}			350	500	mVp-p
Luminance signal input amplitude	V _{IN-Y}			400	572	mVp-p

Pin Assignment

Block Diagram

LC89977M

Control Pin Functions

CONT	Mode (representative)	Chrominance signal delay (number of CCD stages)	Luminance signal delay (number of CCD stages)
Low	PAL/GBI	2H (1703.5) + 0H (1)	1H (848)
High	4.43NTSC	1H (845.5) + 0H (1)	1H (842)

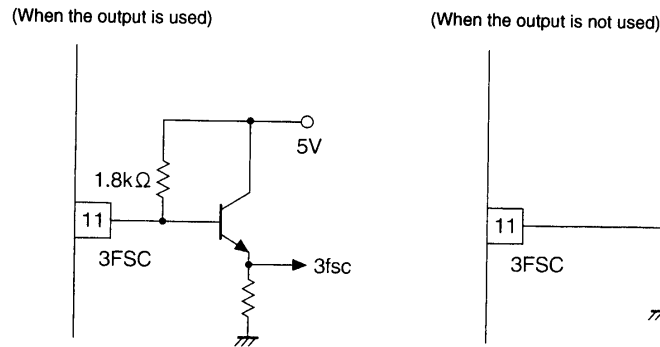

Switching Voltage Levels

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
Switching voltage level: low	V_L		-0.3	0.0	+0.5	V
Switching voltage level: high	V_H		2.0	5.0	6.0	V

Note: *Since the control pins have built-in pull-down resistors (about 70 k Ω), leaving these pins opens effectively sets them to the low level.

Function of the 3FSC Pin

This pin provides a 3fsc clock signal generated by the 3 \times PLL frequency multiplier circuit.

A06300

Electrical Characteristics at $V_{DD} = 5.0$ V, $T_a = 25^\circ\text{C}$, $F_{CLK} = 4.43361875$ MHz, $V_{CLK} = 500$ mVp-p

Parameter	Symbol	Switch states				Ratings			Unit
		SW1	SW2	SW3	Test conditions	min	typ	max

	T _{DY-2}	b	a	b	*18				

Test Conditions

- The supply current with no input signal
- The pin output voltage (the center bias voltage) with no input signal
- Measure the C-OUT output when a 350-mVp-p sine wave is input to C-IN1 and C-IN2.

$$G_{VC} = 20 \log \frac{\text{C-OUT output [mVp-p]}}{350 \text{ [mVp-p]}} \text{ [dB]}$$

Test frequencies:

- G_{VC-1}: 4.429662 MHz (PAL/GBI)
 G_{VC-2}: 4.425694 MHz (4.43NTSC)

- Measure the comb depth from the C-OUT output when a 350-mVp-p sine wave with frequency fa is input to C-IN1 and C-IN2, and when a sine wave of frequency fb is input.

$$C_D = 20 \log \frac{\text{The C-OUT output for an fb input [mVp-p]}}{\text{The C-OUT output for an fa input [mVp-p]}} \text{ [dB]}$$

Test Frequencies

- | | |
|---------------------------------|---------------------|
| fa | fb |
| C _{D-1} : 4.429662 MHz | 4.425756 (PAL/GBI) |
| G _{D-2} : 4.425694 MHz | 4.417819 (4.43NTSC) |

5. Measure the C-OUT output when a 200-mVp-p sine wave is input to C-IN1 and C-IN2, and when a 500-mVp-p sine wave is input, and calculate the gain difference as follows:

$$L_{NC} = 20 \log \left(\frac{\text{The output for a 500-mVp-p input [mVp-p]}}{500 \text{ [mVp-p]}} \bigg/ \frac{\text{The output for a 200-mVp-p input [mVp-p]}}{200 \text{ [mVp-p]}} \right) [\text{dB}]$$

Test Frequencies

- L_{NC-1} 4.429662MHz (PAL/GBI)
- L_{NC-2} 4.425694MHz (4.43NTSC)

6. Measure the 3fsc (13.3 MHz) and fsc (4.43 MHz) components in the C-OUT output with no input signal.
7. Measure the noise in the C-OUT output with no input signal.
Measure the noise with a noise meter with a 200-kHz high-pass filter and a 5-MHz low-pass filter.
8. Input a 350-mVp-p sine wave to C-IN1 and C-IN2. Let V1 be the C-OUT output when SW3 is set to the 'a' position, and let V2 be the C-OUT output when SW3 is set to the 'b' position.

$$Z_{OC} = \frac{V2 \text{ [mVp-p]} - V1 \text{ [mVp-p]}}{V1 \text{ [mVp-p]}} \times 500 \text{ [dB]}$$

Test Frequencies

- Z_{OC-1} : 4.429662 MHz (PAL/GBI)
- Z_{OC-2} : 4.425694 MHz (4.43NTSC)

9. The delay time in the C-OUT output with respect to the C-IN1 input. This is the CCD 1-bit delay.
10. The pin output voltage (clamp voltage) with no input signal.
11. Measure the Y-OUT output with a 200-kHz 400-mVp-p sine wave input to Y-IN.

$$G_{VY} = 20 \log \frac{\text{Y-OUT output [mVp-p]}}{400 \text{ [mVp-p]}} \text{ [dB]}$$

12. Measure the Y-OUT output when a 200-kHz 200-mVp-p sine wave is input to Y-IN, and when a 3.3-MHz 200-mVp-p sine wave is input.

$$G_{FY} = 20 \log \frac{\text{The Y-OUT output for a 3.3-MHz input [mVp-p]}}{\text{The Y-OUT output for a 200-kHz input [mVp-p]}} \text{ [dB]}$$

Here, adjust Vbias so that the clamp level is +250 mV.

13. Apply a 5-step staircase wave (as in the figure below) to Y-IN, and measure the differential gain and differential phase in the Y-OUT output using a vector scope.

14. Apply a 5-step staircase wave (as in the figure below) to Y-IN, and measure the luminance level (Y) and the sync level (S) in the Y-OUT output.

$$L_S = \frac{S \text{ [mV]}}{Y \text{ [mV]}} \times 100 \text{ [%]}$$

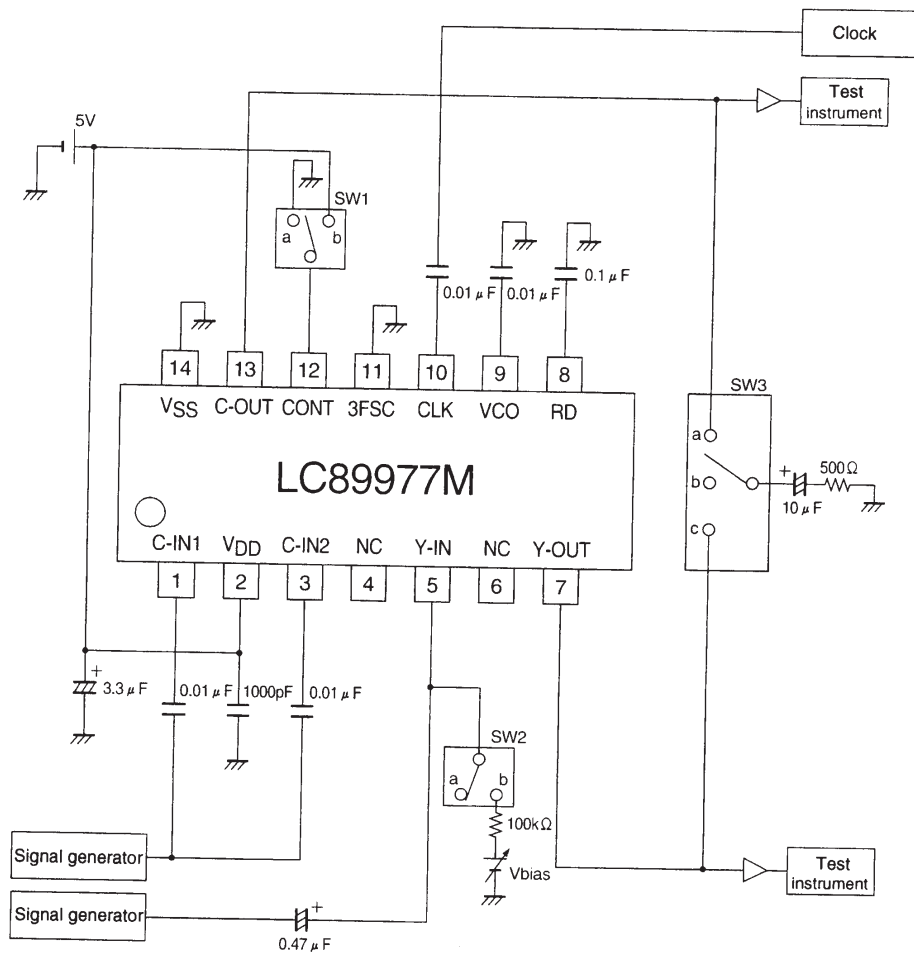

15. Measure the 3fsc (13.3 MHz) and fsc (4.43 MHz) components in the Y-OUT output with no input signal.
16. Measure the noise in the Y-OUT output with no input signal.
Measure the noise with a noise meter with a 200-kHz low-pass filter, a 5-MHz low-pass filter, and a 4.43-MHz trap filter.
17. Input a 200-kHz, 400-mVp-p sine wave to Y-IN1. Let V1 be the V-OUT output when SW3 is set to the 'c' position, and let V2 be the Y-OUT output when SW3 is set to the 'b' position.

$$Z_{OY} = \frac{V2 \text{ [mVp-p]} - V1 \text{ [mVp-p]}}{V1 \text{ [mVp-p]}} \times 500 \text{ [\Omega]}$$

18. Measure the delay time in the Y-OUT output with respect to the input to Y-IN.
