8M x32 Mobile DDR SDRAM

1. FEATURES

• VDD/VDDQ = 1.8V/1.8V
• Double-data-rate architecture; two data transfers per clock cycle
• Bidirectional data strobe(DQS)
• Four banks operation
• Differential clock inputs(CK and $\overline{CK}$)
• MRS cycle with address key programs
  - CAS Latency (2, 3)
  - Burst Length (2, 4, 8, 16)
  - Burst Type (Sequential & Interleave)
• EMRS cycle with address key programs
  - Partial Array Self Refresh (Full, 1/2, 1/4 Array)
  - Output Driver Strength Control (Full, 1/2, 1/4, 1/8)
• Internal Temperature Compensated Self Refresh
• Deep Power Down Mode
• All inputs except data & DM are sampled at the positive going edge of the system clock(CK).
• Data I/O transactions on both edges of data strobe, DM for masking.
• Edge aligned data output, center aligned data input.
• No DLL; CK to DQS is not synchronized.
• DM0 - DM3 for write masking only.
• Auto refresh duty cycle
  - 15.6us for -25 to 85 °C

7. Input/Output Function Description

Symbol	Type	Description
CK, $\overline{CK}$	Input	Clock : CK and $\overline{CK}$ are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK and negative edge of $\overline{CK}$. Internal clock signals are derived from CK/$\overline{CK}$.
CKE	Input	Clock Enable : CKE HIGH activates, and CKE LOW deactivates internal clock signals, and device input buffers and output drivers. Taking CKE LOW provides PRECHARGE POWER-DOWN and SELF REFRESH operation (all banks idle), or ACTIVE POWER-DOWN (row ACTIVE in any banks). CKE is synchronous for all functions except for disabling outputs, which is achieved asynchronously. Input buffers, excluding CK, $\overline{CK}$ and CKE , are disabled during power-down and self refresh mode which are contrived for low standby power consumption.
$\overline{CS}$	Input	Chip Select : $\overline{CS}$ enables(registered LOW) and disables(registered HIGH) the command decoder. All commands are masked when $\overline{CS}$ is registered HIGH. $\overline{CS}$ provides for external bank selection on systems with multiple banks. $\overline{CS}$ is considered part of the command code.
$\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$	Input	Command Inputs : $\overline{RAS}$, $\overline{CAS}$ and $\overline{WE}$ (along with $\overline{CS}$) define the command being entered.
DM0,DM1, DM2,DM3	Input	Input Data Mask : DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH along with that input data during a WRITE access. DM is sampled on both edges of DQS. DM pins include dummy loading internally, to match the DQ and DQS loading. For the x32, DM0 corresponds to the data on DQ0-DQ7 ; DM1 corresponds to the data on DQ8-DQ15, DM2 corresponds to the data on DQ16-DQ23, DM3 corresponds to the data on DQ24-DQ31
BA0, BA1	Input	Bank Addres Inputs : BA0 and BA1 define to which bank an ACTIVE, READ, WRITE or PRECHARGE command is being applied.
A [n : 0]	Input	Address Inputs : Provide the row address for ACTIVE commands, and the column address and AUTO PRECHARGE bit for READ/WRITE commands, to select one location out of the memory array in the respective bank. A10 sampled during a PRECHARGE command determines whether the PRECHARGE applies to one bank (A10 LOW) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by BA0, BA1. The address inputs also provide the op-code during a MODE REGISTER SET command. BA0 and BA1 determines which mode register(mode register or extended mode register) is loaded during the MODE REGISTER SET command.
DQ	I/O	Data Input/Output : Data bus
DQS0,DQS1, DQS2,DQS3	I/O	Data Strobe : Output with read data, input with write data. Edge-aligned with read data, centered in write data. it is used to fetch write data. For the x32, DQS0 corresponds to the data on DQ0-DQ7 ; DQS1 corresponds to the data on DQ8-DQ15,DQS2 corresponds to the data on DQ16-DQ23, DQS3 corresponds to the data on DQ24-DQ31
NC	-	No Connect : No internal electrical connection is present.
VDDQ	Supply	DQ Power Supply : 1.7V to 1.95V
VSSQ	Supply	DQ Ground.
VDD	Supply	Power Supply : 1.7V to 1.95V
VSS	Supply	Ground.

9. Mode Register Definition

9.1. Mode Register Set(MRS)

The mode register is designed to support the various operating modes of DDR SDRAM. It includes Cas latency, addressing mode, burst length, test mode and vendor specific options to make DDR SDRAM useful for variety of applications. The default value of the mode register is not defined, therefore the mode register must be written in the power up sequence of DDR SDRAM. The mode register is written by asserting low on $\overline{CS}$, $\overline{RAS}$, $\overline{CAS}$ and $\overline{WE}$(The DDR SDRAM should be in active mode with CKE already high prior to writing into the mode register). The states of address pins A0 ~ A11 and BA0, BA1 in the same cycle as $\overline{CS}$, $\overline{RAS}$, $\overline{CAS}$ and $\overline{WE}$ going low are written in the mode register. Two clock cycles are required to complete the write operation in the mode register. Even if the power-up sequence is finished and some read or write operation is executed afterward, the mode register contents can be changed with the same command and two clock cycles. This command must be issued only when all banks are in the idle state. If mode register is changed, extended mode register automatically is reset and come into default state. So extended mode register must be set again. The mode register is divided into various fields depending on functionality. The burst length uses A0 ~ A2, addressing mode uses A3, Cas latency(read latency from column address) uses A4 ~ A6, A7 ~ A11 is used for test mode. BA0 and BA1 must be set to low for proper MRS operation.

9.2. Extended Mode Register Set(EMRS)

The extended mode register is designed to support partial array self refresh or driver strength control. EMRS cycle is not mandatory and the EMRS command needs to be issued only when either PASR or DS is used. The default state without EMRS command issued is half driver strength, and Full array refreshed. The extended mode register is written by asserting low on $\overline{CS}$, $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$ and high on BA1 ,low on BA0(The DDR SDRAM should be in all bank precharge with CKE already high prior to writing into the extended mode register). The state of address pins A0 ~ A11 in the same cycle as $\overline{CS}$, $\overline{RAS}$, $\overline{CAS}$ and $\overline{WE}$ going low is written in the extended mode register. Two clock cycles are required to complete the write operation in the extended mode register. Even if the power-up sequence is finished and some read or write operations is executed afterward, the mode register contents can be changed with the same command and two clock cycles. But this command must be issued only when all banks are in the idle state. A0 - A2 are used for partial array self refresh and A5 - A6 are used for driver strength control. "High" on BA1 and"Low" on BA0 are used for EMRS. All the other address pins except A0,A1,A2,A5,A6, BA1, BA0 must be set to low for proper EMRS operation. Refer to the table for specific codes.

NOTE :
1) RFU(Reserved for future use) should stay "0" during EMRS cycle

9.3. Internal Temperature Compensated Self Refresh (TCSR)

1. In order to save power consumption, Mobile DDR SDRAM includes the internal temperature sensor and control units to control the self refresh cycle automatically according to the two temperature ranges ; 45 °C and 85 °C.

2. If the EMRS for external TCSR is issued by the controller, this EMRS code for TCSR is ignored.

Temperature Range	Self Refresh Current (IDD6)						Unit
	- E			- G			
	Full Array	1/2 Array	1/4 Array	Full Array	1/2 Array	1/4 Array	
45 °C[1)]	200	160	140	150	135	130	uA
85 °C	450	300	250	300	250	225	

NOTE :
1) It has +/- 5 °C tolerance.

9.4. Partial Array Self Refresh (PASR)

1. In order to save power consumption, Mobile DDR SDRAM includes PASR option.
2. Mobile DDR SDRAM supports three kinds of PASR in self refresh mode; Full array, 1/2 Array, 1/4 Array.

Power dissipation	P_D	1.0	W
Short circuit current	I_{OS}	50	mA

NOTE :
1) Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded.
2) Functional operation should be restricted to recommend operation condition.
3) Exposure to higher than recommended voltage for extended periods of time could affect device reliability.

11. DC Operating Conditions

Recommended operating conditions(Voltage referenced to VSS=0V, Tc = -25°C to 85°C)

NOTE :
1) Under all conditions, VDDQ must be less than or equal to VDD.
2) These parameters should be tested at the pin on actual components and may be checked at either the pin or the pad in simulation.

NOTE :

1) It has +/- 5°C tolerance.
2) DPD(Deep Power Down) function is an optional feature, and it will be enabled upon request.
   Please contact Samsung for more information.
3) IDD specifications are tested after the device is properly intialized.
4) Input slew rate is 1V/ns.
5) Definitions for IDD: LOW is defined as $V_{IN} \leq 0.1 * VDDQ$;
   HIGH is defined as $V_{IN} \geq 0.9 * VDDQ$;
   STABLE is defined as inputs stable at a HIGH or LOW level ;
   SWITCHING is defined as: - address and command: inputs changing between HIGH and LOW once per two clock cycles ;
   - data bus inputs: DQ changing between HIGH and LOW once per clock cycle; DM and DQS are STABLE.

13. AC Operating Conditions & Timming Specification

Parameter/Condition	Symbol	Min	Max	Unit	Note
Input High (Logic 1) Voltage, all inputs	VIH(AC)	0.8 x VDDQ	VDDQ+0.3	V	1
Input Low (Logic 0) Voltage, all inputs	VIL(AC)	-0.3	0.2 x VDDQ	V	1

NOTE :
1) These parameters should be tested at the pin on actual components and may be checked at either the pin or the pad in simulation.
2) The value of V_{IX} is expected to equal $0.5*V_{DDQ}$ of the transmitting device and must track variations in the DC level of the same.

NOTE :

1) Input Setup/Hold Slew Rate Derating

Input Setup/Hold Slew Rate	ΔtIS	ΔtIH
(V/ns)	(ps)	(ps)
1.0	0	0
0.8	+50	+50
0.6	+100	+100

This derating table is used to increase t_{IS}/t_{IH} in the case where the input slew rate is below 1.0V/ns.

2) Minimum 3CLK of tDAL(= tWR + tRP) is required because it need minimum 2CLK for tWR and minimum 1CLK for tRP.

3) tAC(min) value is measured at the high Vdd(1.95V) and cold temperature(-25°C).
tAC(max) value is measured at the low Vdd(1.7V) and hot temperature(85°C).
tAC is measured in the device with half driver strength and under the AC output load condition (Fig.6 in next Page).

4) The specific requirement is that DQS be valid(High or Low) on or before this CK edge. The case shown(DQS going from High_Z to logic Low) applies when no writes were previously in progress on the bus. If a previous write was in progress, DQS could be High at this time, depending on tDQSS.

5) I/O Setup/Hold Slew Rate Derating

I/O Setup/Hold Slew Rate	ΔtIS	ΔtIH
(V/ns)	(ps)	(ps)
1.0	0	0
0.8	+75	+75
0.6	+150	+150

This derating table is used to increase t_{DS}/t_{DH} in the case where the I/O slew rate is below 1.0V/ns.

6) I/O Delta Rise/Fall Rate(1/slew-rate) Derating

Data Rise/Fall Rate	ΔtIS	ΔtIH
(ns/V)	(ps)	(ps)
0	0	0
±0.25	+50	+50
±0.5	+100	+100

This derating table is used to increase tDS/tDH in the case where the DQ and DQS slew rates differ. The Delta Rise/Fall Rate is calculated as 1/SlewRate1-1/SlewRate2. For example, if slew rate 1 = 1.0V/ns and slew rate 2 =0.8V/ns, then the Delta Rise/Fall Rate =-0.25ns/V.

7) Maximum burst refresh cycle : 8

15. AC Operating Test Conditions (V_{DD} = 1.7V to 1.95V, T_C = -25 to 85°C)

Parameter	Value	Unit

Input timing measurement reference level	0.5 x VDDQ	V
Input signal minimum slew rate	1.0	V/ns
Output timing measurement reference level	0.5 x VDDQ	V
Output load condition	See Figure 6

(V=Valid, X=Don't Care, H=Logic High, L=Logic Low)

NOTE :
1) OP Code : Operand Code. A0 ~ A11 & BA0 ~ BA1 : Program keys. (@EMRS/MRS)
2) EMRS/ MRS can be issued only at all banks precharge state.
   A new command can be issued 2 clock cycles after EMRS or MRS.
3) Auto refresh functions are same as the CBR refresh of DRAM.
   The automatical precharge without row precharge command is meant by "Auto".
   Auto/self refresh can be issued only at all banks precharge state.
4) BA0 ~ BA1 : Bank select addresses.
5) If A10/AP is "High" at row precharge, BA0 and BA1 are ignored and all banks are selected.
6) During burst write with auto precharge, new read/write command can not be issued.
   Another bank read/write command can be issued after the end of burst.
   New row active of the associated bank can be issued at tRP after the end of burst.
7) Burst stop command is valid at every burst length.
8) DM sampled at the rising and falling edges of the DQS and Data-in are masked at the both edges (Write DM latency is 0).
9) This combination is not defined for any function, which means "No Operation(NOP)" in Mobile DDR SDRAM.

NOTE :
1) All entries assume that CKE was High during the preceding clock cycle and the current clock cycle.
2) ILLEGAL to bank in specified state ; function may be legal in the bank indicated by BA, depending on the state of that bank.
(ILLEGAL = Device operation and/or data integrity are not guaranteed.)
3) Must satisfy bus contention, bus turn around and write recovery requirements.
4) NOP to bank precharging or in idle sate. May precharge bank indicated by BA.
5) ILLEGAL if any bank is not idle.
6) Refer to "Read with Auto Precharge Timing Diagram" for detailed information.
7) Refer to "Write with Auto Precharge Timing Diagram" for detailed information.
8) CKE Low to High transition will re-enable CK, $\overline{CK}$ and other inputs asynchronously.
A minimum setup time must be satisfied before issuing any command other than EXIT.
9) Power-Down, Self-Refresh and Deep Power Down Mode can be entered only from All Bank Idle state.
10) The Deep Power Down Mode is exited by asserting CKE high and full initialization is required after exiting Deep Power Down Mode.
