

Micropower Supply Voltage Supervisor (SVS)

Features

- Precision voltage sensor
- Two threshold options: 2.93V or 4.63V
- Stable over temperature
- Valid output logic while $V_{CC} = 0V$.
- Power-on reset pulse width of 140ms (min.) to 460ms (max.)
- Low quiescent current (40 μ A typ.)
- No external components required
- 3-pin SOT23 package
- "809" compatible pinout
- Lead-free versions available

Applications

- Critical μ P and μ C power monitoring
- PCI applications
- Memory integrity during "brownouts"

Product Description

The CM3403 is a micropower low voltage supply supervisor designed to provide the necessary power-on reset control for microprocessors and memory applications. An internal pull-down resistor on the $\overline{\text{RESET}}$ output ensures the output remains valid under all supply conditions.

During either a cold-start power-up or a complete power-down sequence, the $\overline{\text{RESET}}$ output will remain at 0V while the V_{CC} input voltage is between the threshold level and ground.

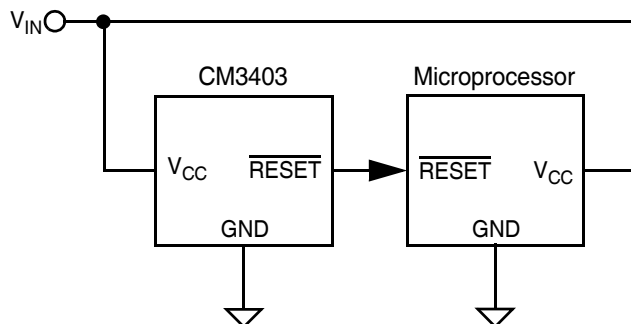

When the V_{CC} input exceeds the preset threshold voltage, an internal timer is triggered and the $\overline{\text{RESET}}$ output remains active for a minimum of 140ms, at which point the output is taken inactive.

In the event of a "brown-out" condition and the V_{CC} voltage collapses below the threshold the $\overline{\text{RESET}}$ output is immediately asserted.

Both the trigger threshold and the precision delay pulse are internally controlled eliminating the requirement for external components.

The CM3403 is housed in a 3-pin SOT23 package and is available with optional lead-free finishing.

PIN DESCRIPTIONS

PIN(S)	NAME	DESCRIPTION
1	GND	Negative reference for all signals.
2	$\overline{\text{RESET}}$	Active low reset output. When the sense threshold has been exceeded, the $\overline{\text{RESET}}$ signal will remain active for an additional 140ms (min.) after which it becomes inactive. During a "brownout" condition, $\overline{\text{RESET}}$ will immediately become active. Internal circuitry ensures $\overline{\text{RESET}}$ will remain active even when the supply voltage is as low as 0V.
3	V _{CC}	Supply input signal which is monitored by the sense comparator. This input is compared to the 2.93V (CM3403-29ST/SO) or 4.63V (CM3403-46ST/SO) reference to determine the state of the output.
