# STK433-100-E — 2-channel class AB audio power IC, 100W+100W

#### Overview

The STK433-100-E is a hybrid IC designed to be used in 100W × 2ch class AB audio power amplifiers.

### **Applications**

• Audio power amplifiers.

#### **Features**

- Pin-to-pin compatible outputs ranging from 80W to 150W.
- Can be used to replace the STK433-000 series (30W to 60W/2ch)and STK433-200/-300 series (3-channel) due to its pin compatibility
- Miniature package (67.0mm × 25.6mm × 9.0mm)
- Output load impedance:  $R_L = 6\Omega$  supported
- Allowable load shorted time: 0.3 second
- Allows the use of predesigned applications for standby and mute circuits.

#### **Series Models**

	STK433-090-E	STK433-100-E	STK433-120-E	STK433-130-E							
Output 1 (10%/1kHz)	80W×2 channels	100W×2 channels	120W×2 channels	150W×2 channels							
Output 2 (0.4%/20Hz to 20kHz)	50W×2 channels	60W×2 channels	80W×2 channels	100W×2 channels							
Max. rated V <sub>CC</sub> (quiescent)	±54V	±57V	±65V	±71.5V							
Max. rated $V_{CC}$ (6 $\Omega$ )	±47V	±50V	±57V	±63V							
Recommended operating V <sub>CC</sub> (6Ω)	±33V	±35V	±40V	±44V							
Dimensions (excluding pin height)	67.0mm×25.6mm×9.0mm										

- Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment (home appliances, AV equipment, communication device, office equipment, industrial equipment etc.). The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for applications outside the standard applications of our customer who is considering such use and/or outside the scope of our intended standard applications, please consult with us prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.
- Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

#### [Remarks]

- \*1: For 1-channel operation
- \*2: Unless otherwise specified, use a constant-voltage power supply to supply power when inspections are carried out.
- \*3: The output noise voltage values shown are peak values read with a VTVM. However, an AC stabilized (50Hz) power supply should be used to minimize the influence of AC primary side flicker noise on the reading.
- \*4: Use the designated transformer power supply circuit shown in the figure below for the measurement of allowable load shorted time and output noise voltage.
- \*5: Please connect –Pre V<sub>CC</sub> pin (#1 pin) with the stable minimum voltage. and connect so that current does not flow in by reverse bias.
- \*6: Thermal design must be implemented based on the conditions under which the customer's end products are expected to operate on the market.
- \*7: Be sure to use the current limiting resistor to prevent the current flowing into the standby pin (pin13) never exceeds the maximum rated value in operating mode.
  - The circuit is turned on by applying VBE (approximately 0.6V) or higher voltage to the standby pin (pin13).
- \*8: A thermoplastic adhesive resin is used for this hybrid IC.

# **Evaluation Board Characteristics**

[Thermal Design Example for STK433-100-E ( $R_L = 6\Omega$ )]

The thermal resistance,  $\theta c$ -a, of the heat sink for total power dissipation, Pd, within the hybrid IC is determined as follows.

Condition 1: The hybrid IC substrate temperature, Tc, must not exceed 125°C.

$$Pd \times \theta c\text{-}a + Ta < 125^{\circ}C \qquad (1)$$

Ta: Guaranteed ambient temperature for the end product

Condition 2: The junction temperature, Tj, of each power transistor must not exceed 150°C.

$$Pd \times \theta c - a + Pd/N \times \theta j - c + Ta < 150^{\circ}C \dots (2)$$

N: Number of power transistors

 $\theta$ j-c: Thermal resistance per power transistor

However, the power dissipation, Pd, for the power transistors shall be allocated equally among the number of power transistors.

The following inequalities result from solving equations (1) and (2) for  $\theta$ c-a.

$$\theta c\text{-}a < (125 - Ta)/Pd$$
 ......(1)'

$$\theta c\text{-}a < (150-Ta)/Pd - \theta j\text{-}c/N \ ... \ (2)'$$

Values that satisfy these two inequalities at the same time represent the required heat sink thermal resistance.

When the following specifications have been stipulated, the required heat sink thermal resistance can be determined from formulas (1)' and (2)'.

Supply voltage
 Load resistance
 Guaranteed ambient temperature
 Ta

#### [Example]

When the IC supply voltage,  $V_{CC}$ , is  $\pm 35V$  and  $R_L$  is  $6\Omega$ , the total power dissipation, Pd, within the hybrid IC, will be a maximum of 107W at 1kHz for a continuous sine wave signal according to the Pd-PO characteristics. For the music signals normally handled by audio amplifiers, a value of  $1/8P_O$  max is generally used for Pd as an estimate of the power dissipation based on the type of continuous signal. (Note that the factor used may differ depending on the safety standard used.)

This is:

Pd 
$$\approx 66W$$
 (when 1/8PO max. = 7.5W, PO max. = 100W).

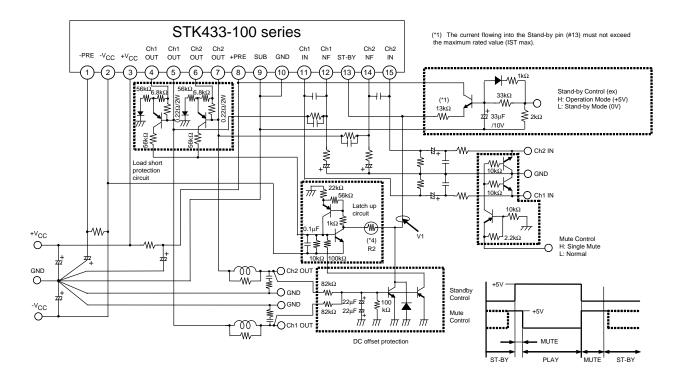

The number of power transistors in audio amplifier block of these hybrid ICs, N, is 4, and the thermal resistance per transistor,  $\theta$ j-c, is 1.8°C/W. Therefore, the required heat sink thermal resistance for a guaranteed ambient temperature, Ta, of 50°C will be as follows.

From formula (1)' 
$$\theta c\text{-a} < (125 - 50)/66 \\ < 1.13$$
 From formula (2)' 
$$\theta c\text{-a} < (150 - 50)/66 - 1.8/4 \\ < 1.06$$

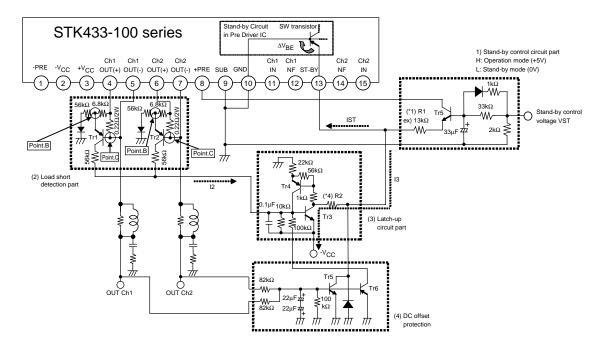

Therefore, the value of 1.06°C/W, which satisfies both of these formulae, is the required thermal resistance of the heat sink.

Note that this thermal design example assumes the use of a constant-voltage power supply, and is therefore not a verified design for any particular user's end product.

# STK433-100 Series Standby Control, Mute Control, Load-short Protection & DC offset Protection application

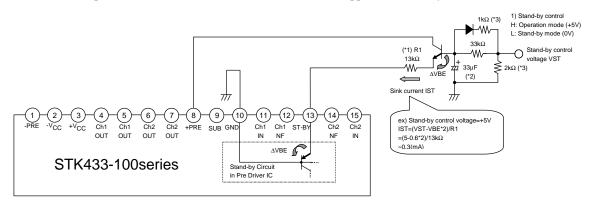

## STK433-100 Series Application Explanation

The protection circuit application for the STK433-100sr consists of the following blocks (blocks (1) to (4)).

- (1) Standby control circuit block
- (2) Load short-circuit detection block
- (3) Latch-up circuit block
- (4) DC voltage protection block
- 1) Standby control circuit block (Reference example) STK433-100 series test circuit (when +5V is applied to Stand-by control.)

Concerning pin 13 reference voltage VST

#### <1> Operation mode

The switching transistor in the bias circuit turns on and places the amplifier into the operating mode when the current flowing into pin 13 (IST) becomes 0.25mA or greater.

#### <2> Standby mode

When the current flowing into pin 13 (IST) is stopped (=0mA), the switching transistor in the bias circuit turns off, placing the amplifier into the standby mode.

- (\*1) The current limiting resistor (R1) must be used to ensure that the current flowing into the stand-by pin (pin 13) does not exceed its maximum rated value IST max.
- (\*2) The pop noise level when the power is turned on can be reduced by setting the time constant with a capacitor in operating mode.
- (\*3) Determines the time constant at which the capacitor (\*3) is discharged in standby mode.

#### 2) Load short-circuit detection block

Since the voltage between point B and point C is less than 0.6V in normal operation mode ( $V_{BE} < 0.6V$ ) and TR1 (or TR2) is not activated, the load short-circuit detection block does not operate.

When a load short-circuit occurs, however, the voltage between point B and point C becomes larger than 0.6V, causing TR1 (or TR2) to turn on  $(V_{BE} > 0.6V)$ , and current I2 to flows.

#### 3) Latch-up circuit block

TR3 is activated when I2 is supplied to the latch-up circuit.

When TR3 turns on and current I3 starts flowing, VST goes down to 0V (standby mode), protecting the power amplifier.

Since TR3 and TR4 configure a thyristor, once TR3 is activated, the IC is held in the standby mode.

To release the standby mode and reactivate the power amplifier, it is necessary to set the standby control voltage temporarily low (0V). Subsequently, when the standby control is returned to high, the power amplifier will become active again.

(\*4) The I3 value varies depending on the supply voltage. Determine the value of R2 using the formula below, so that I1 is equal to or less than I3.

$$I1 \le I3 = V_{CC}/R2$$

#### 4) DC offset protection block

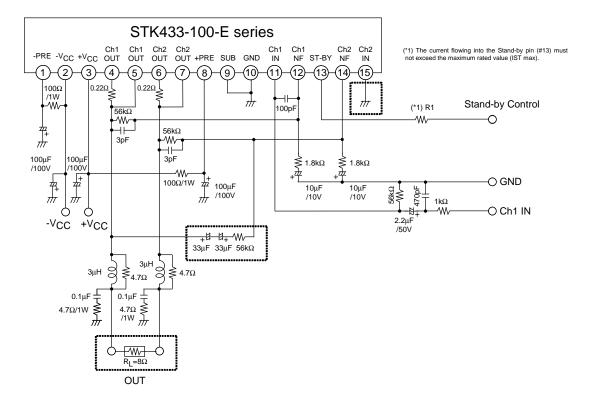

The DC offset protection circuit is activated when  $\pm 0.5$ V (typ) voltage is applied to either "OUT CH1" or "OUT CH2," and the hybrid IC is shut down (standby mode).

To release the IC from the standby mode and reactivate the power amplifier, it is necessary to set the standby control voltage temporarily low (0V).

Subsequently, when the standby control is returned to high (+5V, for example), the power amplifier will become active again.

The protection level must be set using the  $82k\Omega$  resistor. Furthermore, the time constant must be determined using  $22\mu//22\mu$  capacitors to prevent the amplifier from malfunctioning due to the audio signal.

## STK433-100 Series BTL Application

- SANYO Semiconductor Co.,Ltd. assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein.
- SANYO Semiconductor Co.,Ltd. strives to supply high-quality high-reliability products, however, any and all semiconductor products fail or malfunction with some probability. It is possible that these probabilistic failures or malfunction could give rise to accidents or events that could endanger human lives, trouble that could give rise to smoke or fire, or accidents that could cause damage to other property. When designing equipment, adopt safety measures so that these kinds of accidents or events cannot occur. Such measures include but are not limited to protective circuits and error prevention circuits for safe design, redundant design, and structural design.
