

## Single Output A-Series, UWR Models

High-Reliability, 2" x 2" 14-20 Watt, DC/DC Converters

#### **Features**

- Low cost! Highly reliable!
- Proven SMT-on-pcb construction
- · Qual tested; HALT tested; EMC tested
- Designed to meet UL/ EN60950, BASIC insulation (D48A models)
- **C€** mark available (48V<sub>IN</sub> models)
- Output voltages: 3.3/5/5.2/12/15 Volts
- Ultra-wide input voltage ranges: 4.7-7.5V, 9-36V or 18-75V
- Small packages, 2" x 2" x 0.45"
- · Industry-standard pinouts
- Fully isolated, 1500Vdc guaranteed
- Guaranteed efficiencies to 84%
- -40 to +100°C operating temperature
- Modifications and customs for OEM's

DATEL's new A-Series switching DC/DC converters are designed to meet the demanding long-term-reliability and low-cost requirements of modern telecom, datacom, computer/networking and industrial-electronics applications. These highly-efficient, rugged devices combine straightforward circuit topologies, new components, proven SMT-on-pcb construction methods, and highly repeatable automatic-assembly techniques. The flexibility of the designs and their assembly methods readily permit minor modifications to optimize performance for specific applications.

The single-output, 14-20 Watt Models of the A-Series deliver both high power densities and impressive MTBF's. Their superior durability is substantiated by a rigorous in-house qualification program including HALT (Highly Accelerated Life Testing), which is designed to detect any potential electrical, mechanical, or process weaknesses.

Packaged in standard,  $2" \times 2" \times 0.45"$ , shielded metal cases with non-conductive coatings, these fully isolated (1500Vdc minimum) DC/DC's offer excellent line/load regulation, full I/O protection, thermal shutdown, and industry-standard pinouts.

Output voltages include 3.3, 5, 5.2, 12 or 15 Volts. Input voltage ranges are DATEL's traditional ultra-wide 9-36V and 18-75V, as well as 4.7-7.5V. Each device provides remote on/off control and Vout trim capability. All A-Series UWR models are fully EMI characterized and UL1950, CSA 950 and IEC 950 safety approved.

A-Series DC/DC's are extremely reliable, easy-to-use, cost-effective power converters. Use them to improve the reliability of existing equipment or to develop new systems that exceed design objectives.

- These converters require a minimum 10% loading to maintain specified regulation. Operation
  under no-load conditions will not damage these devices; however they may not meet all listed
  specifications.
- ② Application-specific internal input/output filtering can be recommended and perhaps added internally upon request. Contact DATEL Applications Engineering for details.
- Applying a voltage to the Control pin when no input power is applied to the converter can cause permanent damage to the converter.
- 4 "D48A" models have BASIC, all other models have Functional insulation. Devices can be screened or modified for higher guaranteed isolation voltages. Contact DATEL Applications Engineering for details.
- ⑤ Except for 3.3V outputs which have no protection.

Absolute Maximum Ratings			
Input Voltage:			
"D5A" Models	11 Volts		
"D12A" Models	44 Volts		
"D48A" and "D48E" Models	88 Volts		
Input Reverse-Polarity Protection	Current must be <10A. Brief duration only. Fusing recommended.		
Output Overvoltage Protection:			
3.3V Outputs	No protection		
5V/5.2V Outputs	6.8 Volts, limited duration		
12V Outputs	15 Volts, limited duration		
15V Outputs	18 Volts, limited duration		
Output Current	Current limited. Max. current and short-circuit duration are model dependent		
Storage Temperature	-40 to +105°C		
Lead Temperature (soldering, 10 sec.)	+300°C		
These are stress ratings. Exposure of device	es to any of these conditions may adversely under conditions other than those listed in the		

#### TECHNICAL NOTES

#### **Floating Outputs**

Since these are isolated DC/DC converters, their outputs are "floating." Users may ground either the Common (pin 7) for normal usage or the positive side (+Output, pin 6) to effectively reverse the output polarity.

#### **Filtering and Noise Reduction**

All A-Series UWR 14-20 Watt DC/DC Converters achieve their rated ripple and noise specifications without the use of external input/output capacitors. In critical applications, input/output noise may be further reduced by installing electrolytic capacitors across the input terminals and/or low-ESR tantalum or electrolytic capacitors across the output terminals. The caps should be located as close to the power converters as possible. Typical values are listed below. In many applications, using values greater than those listed will yield better results.

#### To Reduce Input Ripple

 D5A Models
  $47\mu\text{F}$ , 16V

 D12A Models
  $20\mu\text{F}$ , 50V

 D48A Models
  $20\text{-}50\mu\text{F}$ , 100V

#### **To Reduce Output Ripple**

3.3V Outputs  $100\mu\text{F}$ , 6V, Low ESR 5V/5.2V Outputs  $47\mu\text{F}$ , 10V, Low ESR 12/15V Outputs  $22\mu\text{F}$ , 20V, Low ESR

In critical, space-sensitive applications, DATEL may be able to tailor the internal input/output filtering of these units to meet your specific requirements. Contact our Applications Engineering Group for additional details.

www.murata-ps.com

Technical enquiries email: sales@murata-ps.com, tel: +1 508 339 3000

#### **Input Fusing**

Certain applications and/or safety agencies may require the installation of fuses at the inputs of power conversion components. For DATEL A-Series UWR 14-20 Watt DC/DC Converters, you should use slow-blow type fuses with values no greater than the following:

V <sub>IN</sub> Range	Fuse Value
D5A	6A
D12A	4A
D48A/D48E	2A

#### **On/Off Control**

The On/Off Control pin (pin 4) may be used for remote on/off operation. A TTL logic high (+2 to +5 Volts,  $250\mu$ A max.) applied to pin 4 disables the converter. A TTL logic low (0 to +0.8 Volts,  $70\mu$ A max.), or no connection, enables the converter. Control voltages should be referenced to pin 2 (–Input). Applying a voltage to the Control pin when no input power is applied to the converter can cause permanent damage to the converter.

#### Synchronization

In critical applications employing multiple switching DC/DC converters, it may be desirable to intentionally synchronize the switching of selected converters (so the system noise can be reduced with notch filtering) or to purposely desynchronize the converters (to lessen the current-carrying requirements on intermediate dc buses). For multiple A-Series Converters, an external clock can be applied to pin 4 (Control) of each device. It should be a square wave with a maximum 1 $\mu$ sec "high" duration and an amplitude between +2V and +5V (see On/Off Control) referenced to pin 2 (–Input). The frequency of the synchronizing clock should be higher than that of any individual converter. Therefore, it should be 185kHz ±5kHz.

#### **Output Trimming**

 $V_{\text{OUT}}$  may be trimmed  $\pm 5\%$  via a single external trimpot or fixed resistor. The trimpot should be connected as shown in Figure 2a with its wiper connected to pin 8 (Trim). A trimpot can be used to determine the value of a single fixed

resistor which should be connected as shown in Figure 2b. Connect the resistor between pin 8 (Trim) and pin 6 (+Output) to trim "down" the output voltage. Connect the resistor between pins 8 and 7 (Common) to trim "up" the output voltage. Fixed resistors should be metal-film types with absolute TCR's less than 100ppm/°C to ensure stability.

#### **Custom Capabilities**

DATEL's world-class design, development and manufacturing team stands ready to work with you to deliver the exact power converter you need for your demanding, large volume, OEM applications. More importantly . . . we'll do it on time and within budget!

Our experienced applications and design staffs; quick-turn prototype capability; highly automated, SMT assembly facilities; and in-line SPC quality-control techniques combine to give us the unique ability to design and deliver any quantity of power converters to the highest standards of quality and reliability.

We have compiled a large library of DC/DC designs that are currently used in a variety of telecom, medical, computer, railway, aerospace and industrial applications. We may already have the converter you need.

Contact us. Our goal is to provide you the highest-quality, most cost-effective power converters available.

### **Typical Performance Curves** $(T_A = +25^{\circ}C)$

The performance curves below were derived from actual test data for a single model number (UWR-5/4000-D12A). Since all devices in the 14-20W UWR A-Series have the same circuit topology, the performance curves are representative of all devices.

#### EFFICIENCY

#### LINE REGULATION

#### LOAD REGULATION

### EMI RADIATED EMISSIONS

If you're designing with EMC in mind, please note that all of DATEL's UWR 14-20 Watt A-Series DC/DC Converters have been characterized for radiated and conducted emissions in our new EMI/EMC laboratory. Testing is conducted in an EMCO 5305 GTEM test cell utilizing EMCO automated EMC test software. Radiated emissions are tested to the limits of FCC Part 15, Class B and CISPR 22 (EN 55022), Class B. Correlation to other specifications can be supplied upon request. Radiated emissions plots to FCC and CISPR 22 for model UWR-5/4000-D12A appear below. Published EMC test reports are available for each model number. Contact DATEL's Applications Engineering Department for more details.

#### UWR-5/4000-D12A Radiated Emissions FCC Part 15 Class B, 3 Meters Converter Output = 5Vdc @ 3.6A

#### UWR-5/4000-D12A Radiated Emissions EN 55022 Class B, 10 Meters Converter Output = +5Vdc @ 3.6A

## **Quality and Reliability**

The A-Series are the first DC/DC Converters to emerge from DATEL's new, company-wide approach to designing and manufacturing the most reliable power converters available. The five-pronged program draws our Quality Assurance function into all aspects of new-product design, development, characterization, qualification and manufacturing.

www.murata-ps.com

Technical enquiries email: sales@murata-ps.com, tel: +1 508 339 3000

## **UWR Series**

Single Output, High Reliability, 2" x 2", 14-20 Watt, DC/DC Converters

#### **Design for Reliability**

Design for Reliability is woven throughout our multi-phased, new-productdevelopment process. Design-for-reliability practices are fully documented and begin early in the new-product development cycle with the following goals:

- 1. To work from an approved components/vendors list ensuring the use of reliable components and the rigorous qualification of new components.
- 2. To design with safety margins by adhering to a strict set of derating guidelines and performing theoretical worst-case analyses.
- 3. To locate potential design weaknesses early in the product-development cycle by using extensive HALT (Highly Accelerated Life Testing).
- 4. To prove that early design improvements are effective by employing a thorough FRACA (Failure Reporting Analysis and Corrective Action) system.

#### **HALT Testing**

The goal of the accelerated-stress techniques used by DATEL is to force device maturity, in a short period of time, by exposing devices to excessive levels of "every stimulus of potential value." We use HALT (Highly Accelerated Life Testing) repeatedly during the design and early manufacturing phases to detect potential electrical and mechanical design weaknesses that could result in possible future field failures.

During HALT, prototype and pre-production DC/DC converters are subjected to progressively higher stress levels induced by thermal cycling, rate of temperature change, vibration, power cycling, product-specific stresses (such as dc voltage variation) and combined environments. The stresses are not meant to simulate field environments but to expose any weaknesses in a product's electro/mechanical design and/or assembly processes. The goal of HALT is to make products fail so that device weaknesses can be analyzed and strengthened as appropriate. Applied stresses are continually stepped up until products eventually fail. After corrective actions and/or design changes, stresses are stepped up again and the cycle is repeated until the "fundamental limit of the technology" is determined.

DATEL has invested in a Qualmark OVS-1 HALT tester capable of applying voltage and temperature extremes as well as 6-axis, linear and rotational, random vibration. A typical HALT profile (shown above) consists of thermal cycling (-55 to +125°C, 30°C/minute) and simultaneous, gradually increasing, random longitudinal and rotational vibration up to 20G's with load cycling and applied-voltage extremes added as desired. Many devices in DATEL's new A-Series could not be made to fail prior to reaching either the limits of the HALT chamber or some previously known physical limit of the device. We also use the HALT chamber and its ability to rapidly cool devices to verify their "cold-start" capabilities.

#### Qualification

For each new product, electrical performance is verified via a comprehensive characterization process and long-term reliability is confirmed via a rigorous qualification procedure. The qual procedure includes such strenuous tests as thermal shock and 500 hour life. Qual testing is summarized below.

#### **Qualification Testing**

Qualification Test	Method/Comments		
HALT	DATEL in-house procedure		
High Temperature Storage	Max. rated temp., 1,000 hours		
Thermal Shock	10 cycles, -55 to +125°C		
Temperature/Humidity	+85°C, 85% humidity, 48 hours		
Lead Integrity	DATEL in-house procedure		
Life Test	+70°C, 500 hours*		
Marking Permanency	DATEL in-house procedure		
End Point Electrical Tests	Per product specification		

<sup>\*</sup> Interim electrical test at 200 hours

#### In-Line Process Controls and Screening

A combination of statistical sampling and 100% inspection techniques keeps our assembly line under constant control. Parameters such as solder-paste thickness, component placement, cleanliness, etc. are statistically sampled, charted and fine tuned as necessary. Visual inspections are performed by trained operators after pick-and-place, soldering and cleaning operations. Units are 100% electrically tested prior to potting. All devices are temperature cycled, burned-in, hi-pot tested and final-electrical tested prior to external visual examination, packing and shipping.

#### **Rapid Response to Problems**

DATEL employs an outstanding corrective-action system to immediately address any detected shortcomings in either products or processes. Whenever our assembly, quality or engineering personnel spot a product/process problem, or if a product is returned with a potential defect, we immediately perform a detailed failure analysis and, if necessary, undertake corrective actions. Over time, this system has helped refine our assembly operation to yield one of the lowest product defect rates in the industry.
