

Diagonal 8mm (Type 1/2) Progressive Scan CCD Image Sensor with Square Pixel for Color Cameras

Description

The ICX267AK is a diagonal 8mm (Type 1/2) interline CCD solid-state image sensor with a square pixel array and 1.45M effective pixels. Progressive scan allows all pixels' signals to be output independently. Also, the adoption of high frame rate readout mode supports 30 frames per second. This chip features an electronic shutter with variable charge-storage time which makes it possible to realize full-frame still image without a mechanical shutter. High resolution and high color reproductivity are achieved through the use of R, G, B primary color mosaic filters. Further, high sensitivity and low dark current are achieved through the adoption of HAD (Hole-Accumulation Diode) sensors.

This chip is suitable for applications such as electronic still cameras, PC input cameras, etc.

Features

- Progressive scan allows individual readout of the image signals from all pixels.
- High horizontal and vertical resolution (both approx. 800TV-lines) still image without a mechanical shutter.
- Supports high frame rate readout mode (effective 512 lines output, 30 frames/s)
- Square pixel
- Horizontal drive frequency: 28.636MHz
- No voltage adjustments (reset gate and substrate bias are not adjusted.)
- R, G, B primary color mosaic filters on chip
- High resolution, high color reproductivity, high sensitivity, low dark current
- Low smear, excellent antiblooming characteristics
- Continuous variable-speed shutter

**Optical black position
(Top view)**

Device Structure

- Interline CCD image sensor
- Image size: Diagonal 8mm (Type 1/2)
- Total number of pixels: 1434 (H) × 1050 (V) approx. 1.50M pixels
- Number of effective pixels: 1392 (H) × 1040 (V) approx. 1.45M pixels
- Number of active pixels: 1360 (H) × 1024 (V) approx. 1.40M pixels (7.959mm diagonal)
- Chip size: 7.60mm (H) × 6.20mm (V)
- Unit cell size: 4.65μm (H) × 4.65μm (V)
- Optical black:
 - Horizontal (H) direction: Front 2 pixels, rear 40 pixels
 - Vertical (V) direction: Front 8 pixels, rear 2 pixels
- Number of dummy bits: Horizontal 20
Vertical 3
- Substrate material: Silicon

Drive Clock Waveform Conditions

(1) Readout clock waveform

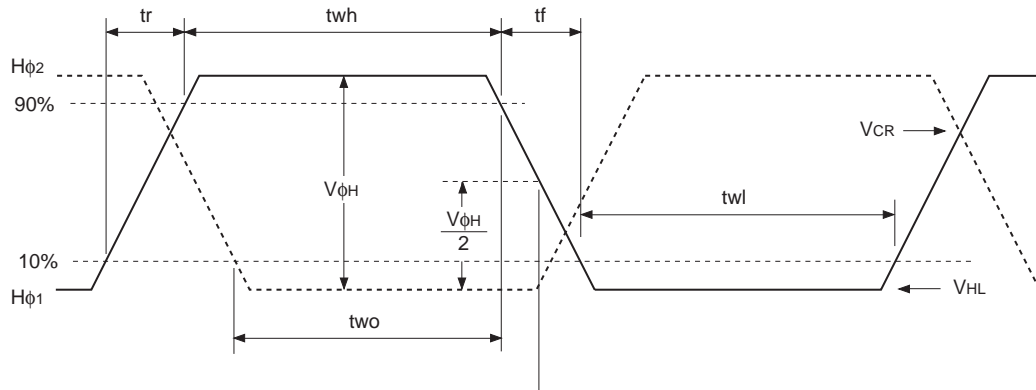

Note) Readout clock is used by composing vertical transfer clocks \$V_{\phi 2A}\$ and \$V_{\phi 2B}\$.

(2) Vertical transfer clock waveform

$$\begin{aligned}
 V_{VH} &= V_{VH02A} \\
 V_{VL} &= (V_{VL01} + V_{VL03})/2 \\
 V_{VL3} &= V_{VL03} \\
 V_{\phi V1} &= V_{VH1} - V_{VL01} \\
 V_{\phi V2A} &= V_{VH02A} - V_{VL2A} \\
 V_{\phi V2B} &= V_{VH02B} - V_{VL2B} \\
 V_{\phi V3} &= V_{VH3} - V_{VL03}
 \end{aligned}$$

(3) Horizontal transfer clock waveform

Cross-point voltage for the Hφ1 rising side of the horizontal transfer clocks Hφ1 and Hφ2 waveforms is VCR. The overlap period for twh and twl of horizontal transfer clocks Hφ1 and Hφ2 is two.

(4) Reset gate clock waveform

VRLH is the maximum value and VRLL is the minimum value of the coupling waveform during the period from Point A in the above diagram until the rising edge of RG.

In addition, VRL is the average value of VRLH and VRLL.

$$V_{RGL} = (V_{RGLH} + V_{RGLL})/2$$

Assuming VRGH is the minimum value during the interval twh, then:

$$V_{\phi RG} = V_{RGH} - V_{RGL}$$

Negative overshoot level during the falling edge of RG is VRLm.

(5) Substrate clock waveform

Clock Switching Characteristics

Item	Symbol	twh			twl			tr			tf			Unit	Remarks

*1 Vsat4 is the saturation signal amount at two pixels addition, and it is 190mV per one pixel. Vsub internal generation value ensures 190mV per one pixel of the saturation signal amount in high frame rate two pixels addition mode.

*2 Eliminates the dark signal shading in the vertical direction by the high-speed transfer of the vertical register.

Zone Definition of Video Signal Shading

Measurement System

Note) Adjust the amplifier gain so that the gain between [*A] and [*B], and between [*A] and [*C] equals 1.

Image Sensor Characteristics Measurement Method

◎ **Color coding and readout of this image sensor**

Gb	B	Gb	B
R	Gr	R	Gr
Gb	B	Gb	B
R	Gr	R	Gr

The primary color filters of this image sensor are arranged in the layout shown in the figure on the left (Bayer arrangement). Gr and Gb denote the G signals on the same line as the R signal and the B signal, respectively.

Color Coding Diagram

All pixel signals are output successively in a 1/15s period.
The R signal and Gr signal lines and the Gb signal and B signal lines are output successively.

© Readout modes

The diagram below shows the output methods for the following three readout modes.

1. Progressive scan mode

In this mode, all pixels signals are output in non-interlace format in 1/15s.

The vertical resolution is approximately 800 TV-lines and all pixels signals within the same exposure period are read out simultaneously, making this mode suitable for high resolution image capturing.

2. High frame rate readout mode

All effective areas are scanned in approximately 1/30s by reading out two out of four lines (3rd and 4th lines, 7th and 8th lines). The vertical resolution is approximately 400 TV-lines.

This readout mode emphasizes processing speed over vertical resolution.

3. High frame rate readout two pixels addition mode

All effective areas are scanned in approximately 1/30s by reading out two out of four lines (3rd and 4th lines, 7th and 8th lines), and by reading out two out of the remaining four lines (1st and 2nd lines, 5th and 6th lines) after shifting the vertical register by 2 bits, and adding them in the vertical register.

◎ Measurement conditions

- 1) In the following measurements, the device drive conditions are at the typical values of the progressive scan mode, bias and clock voltage conditions.
- 2) In the following measurements, spot blemishes are excluded and, unless otherwise specified, the optical black level (OB) is used as the reference for the signal output, which is taken as the value of the Gr/Gb signal output or the R/B signal output of the measurement system.

◎ Definition of standard imaging conditions

- 1) Standard imaging condition Ⅰ

Use a pattern box (luminance: 706cd/m², color temperature of 3200K halogen source) as a subject. (Pattern for evaluation is not applicable.) Use a testing standard lens with CM500S (t = 1.0mm) as an IR cut filter and image at F5.6. The luminous intensity to the sensor receiving surface at this point is defined as the standard sensitivity testing luminous intensity.

- 2) Standard imaging condition Ⅱ:

Image a light source (color temperature of 3200K) with a uniformity of brightness within 2% at all angles. Use a testing standard lens with CM500S (t = 1.0mm) as an IR cut filter. The luminous intensity is adjusted to the value indicated in each testing item by the lens diaphragm.

1. G sensitivity, sensitivity comparison

Set to standard imaging condition Ⅰ. After selecting the electronic shutter mode with a shutter speed of 1/100s, measure the signal outputs (V_{Gr} , V_{Gb} , V_R and V_B) at the center of each Gr, Gb, R and B channel screen, and substitute the values into the following formulas.

$$V_G = (V_{Gr} + V_{Gb})/2$$

$$S_g = V_G \times \frac{100}{30} \text{ [mV]}$$

$$R_r = V_R/V_G$$

$$R_b = V_B/V_G$$

2. Saturation signal

Set to standard imaging condition Ⅰ. After adjusting the luminous intensity to 20 times the intensity with the average value of the Gr signal output, 150mV, measure the minimum values of the Gr, Gb, R and B signal outputs.

3. Smear

Set to standard imaging condition Ⅰ. With the lens diaphragm at F5.6 to F8, first adjust the average value of the Gr signal output to 150mV. Measure the average values of the Gr signal output, Gb signal output, R signal output and B signal output (G_{ra} , G_{ba} , R_a , B_a), and then adjust the luminous intensity to 500 times the intensity with the average value of the Gr signal output, 150mV. After the readout clock is stopped and the charge drain is executed by the electronic shutter at the respective H blankings, measure the maximum value (V_{sm} [mV]) independent of the Gr, Gb, R and B signal outputs, and substitute the values into the following formula.

$$S_m = V_{sm} \div \frac{G_{ra} + G_{ba} + R_a + B_a}{4} \times \frac{1}{500} \times \frac{1}{10} \times 100 \text{ [%]} \text{ (1/10V method conversion value)}$$

4. Video signal shading

Set to standard imaging condition Ⅰ. With the lens diaphragm at F5.6 to F8, adjust the luminous intensity so that the average value of the Gr signal output is 150mV. Then measure the maximum (Grmax [mV]) and minimum (Grmin [mV]) values of the Gr signal output and substitute the values into the following formula.

$$SHg = (Grmax - Grmin)/150 \times 100 [\%]$$

5. Uniformity between video signal channels

After measuring 4, measure the maximum (Rmax [mV]) and minimum (Rmin [mV]) values of the R signal and the maximum (Bmax [mV]) and minimum (Bmin [mV]) values of the B signal, and substitute the values into the following formulas.

$$\Delta Srg = (Rmax - Rmin)/150 \times 100 [\%]$$

$$\Delta Sbg = (Bmax - Bmin)/150 \times 100 [\%]$$

6. Dark signal

Measure the average value of the signal output (Vdt [mV]) with the device ambient temperature 60°C and the device in the light-obstructed state, using the horizontal idle transfer level as a reference.

7. Dark signal shading

After measuring 6, measure the maximum (Vdmax [mV]) and minimum (Vdmin [mV]) values of the dark signal output and substitute the values into the following formula.

$$\Delta Vdt = Vdmax - Vdmin [mV]$$

8. Line crawl

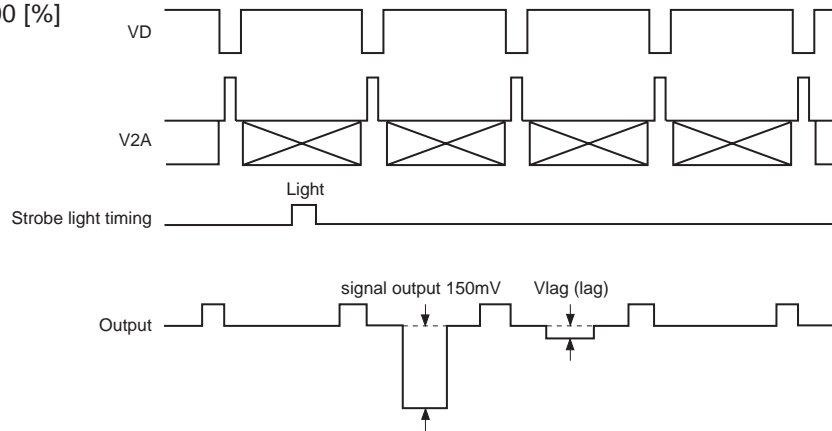

Set to standard imaging condition Ⅰ. Adjusting the luminous intensity so that the average value of the Gr signal output is 150mV, and then insert R, G and B filters and measure the difference between G signal lines (ΔG_{lr} , ΔG_{lg} , ΔG_{lb} [mV]) as well as the average value of the G signal output (G_{ar} , G_{ag} , G_{ab}). Substitute the values into the following formula.

$$Lci = \frac{\Delta G_{li}}{G_{ai}} \times 100 [\%] \quad (i = r, g, b)$$

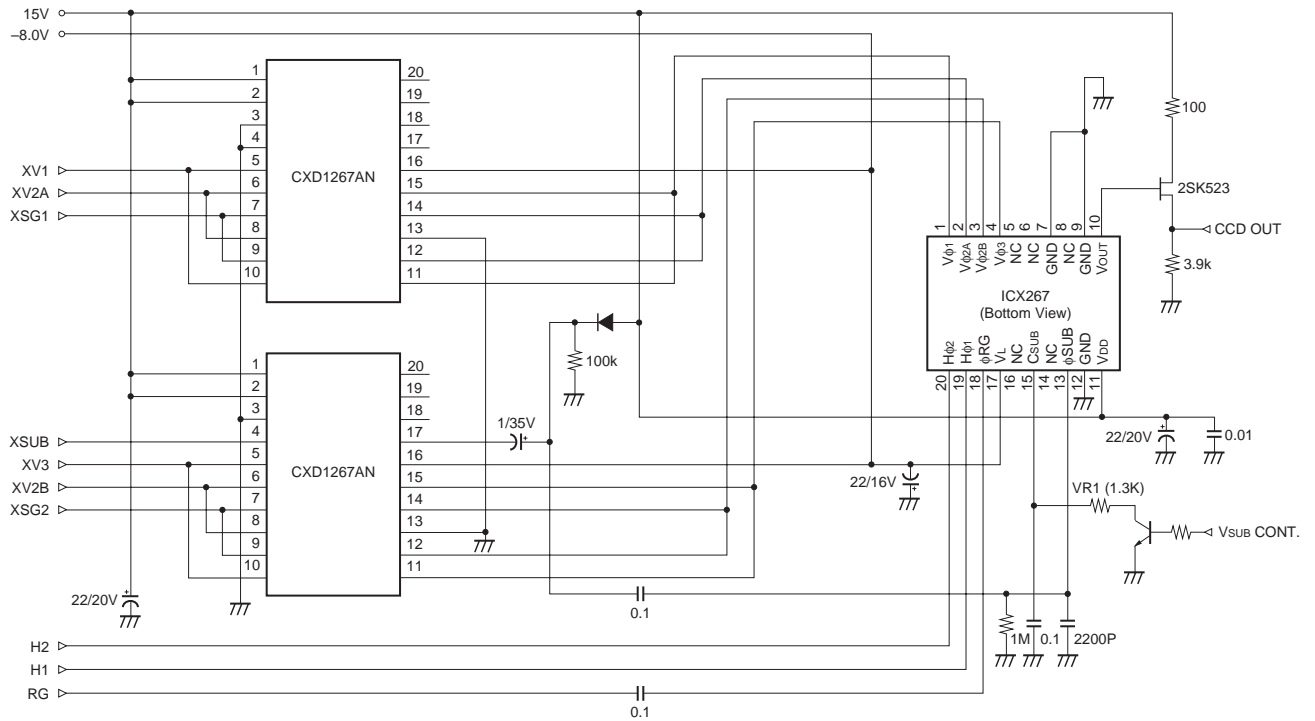

9. Lag

Adjust the Gr signal output value generated by strobe light to 150mV. After setting the strobe light so that it strobescs with the following timing, measure the residual signal (Vlag). Substitute the value into the following formula.

$$Lag = (Vlag/150) \times 100 [\%]$$

Drive Circuit

Note) Substrate bias control

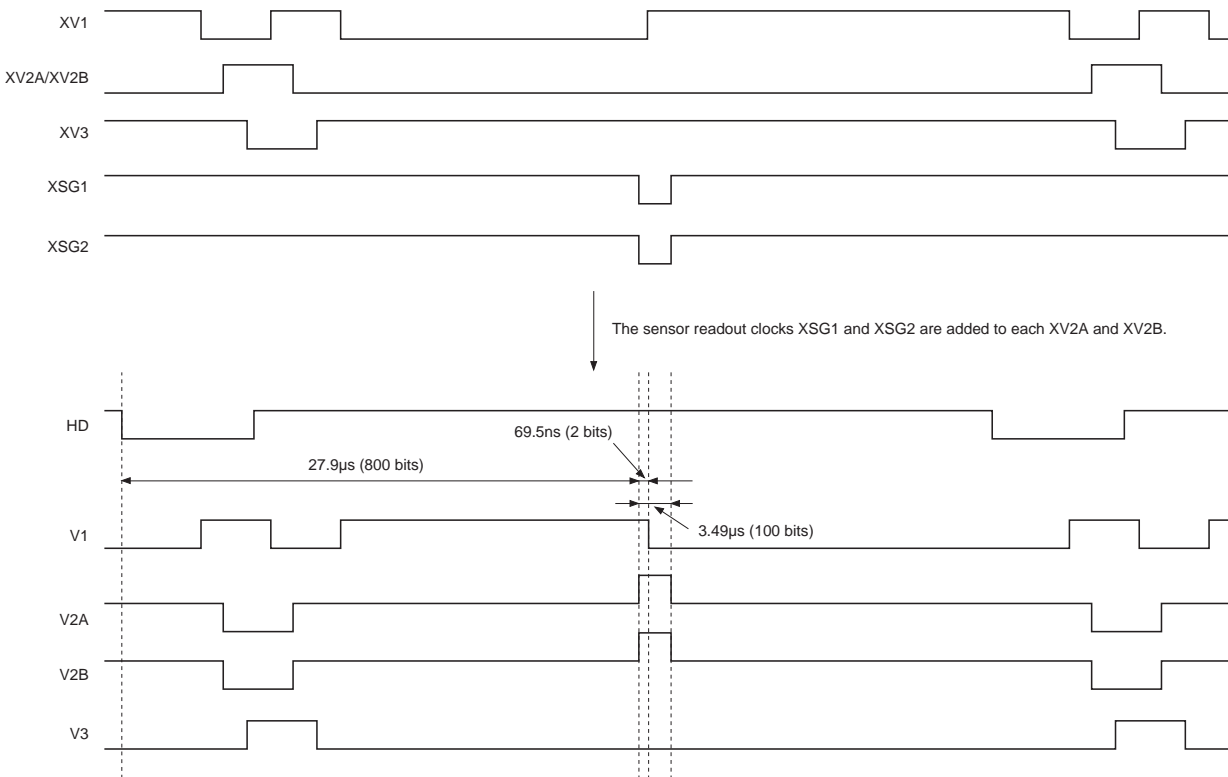

- Connect the ground resistor (VR1) shown below to the C_{SUB} pin in each readout mode in order to secure the saturation signal described on the image sensor characteristics.
 - ~ Progressive scan readout mode : 2.0kΩ
 - ~ High frame rate readout mode : 3.8kΩ
 - ~ High frame rate 2 pixels addition mode: Ground resistor should not be connected.
- If the substrate bias control signal is set to high level, and the ground resistor (VR1) connected to C_{SUB} pin is not grounded at 55ms before the exposure time starts because t_f is late, the internal generation voltage (V_{SUB}) may not fall enough. Substrate bias adjustment control signal V_{SUB} Cont.

Notes on Handling

1) Static charge prevention

CCD image sensors are easily damaged by static discharge. Before handling be sure to take the following protective measures.

- a) Either handle bare handed or use non-chargeable gloves, clothes or material.
Also use conductive shoes.
- b) When handling directly use an earth band.
- c) Install a conductive mat on the floor or working table to prevent the generation of static electricity.
- d) Ionized air is recommended for discharge when handling CCD image sensor.
- e) For the shipment of mounted substrates, use boxes treated for the prevention of static charges.

2) Soldering

- a) Make sure the package temperature does not exceed 80°C .
- b) Solder dipping in a mounting furnace causes damage to the glass and other defects. Use a ground 30W soldering iron and solder each pin in less than 2 seconds. For repairs and remount, cool sufficiently.
- c) To dismount an image sensor, do not use a solder suction equipment. When using an electric desoldering tool, use a thermal controller of the zero cross On/Off type and connect it to ground.

3) Dust and dirt protection

Image sensors are packed and delivered by taking care of protecting its glass plates from harmful dust and dirt. Clean glass plates with the following operation as required, and use them.

- a) Perform all assembly operations in a clean room (class 1000 or less).
- b) Do not either touch glass plates by hand or have any object come in contact with glass surfaces. Should dirt stick to a glass surface, blow it off with an air blower. (For dirt stuck through static electricity ionized air is recommended.)
- c) Clean with a cotton bud and ethyl alcohol if the grease stained. Be careful not to scratch the glass.
- d) Keep in a case to protect from dust and dirt. To prevent dew condensation, preheat or precool when moving to a room with great temperature differences.
- e) When a protective tape is applied before shipping, just before use remove the tape applied for electrostatic protection. Do not reuse the tape.

4) Installing (attaching)

- a) Remain within the following limits when applying a static load to the package. Do not apply any load more than 0.7mm inside the outer perimeter of the glass portion, and do not apply any load or impact to limited portions. (This may cause cracks in the package.)

- b) If a load is applied to the entire surface by a hard component, bending stress may be generated and the package may fracture, etc., depending on the flatness of the bottom of the package. Therefore, for installation, use either an elastic load, such as a spring plate, or an adhesive.

- c) The adhesive may cause the marking on the rear surface to disappear, especially in case the regulated voltage value is indicated on the rear surface. Therefore, the adhesive should not be applied to this area, and indicated values should be transferred to the other locations as a precaution.
- d) The notch of the package is used for directional index, and that can not be used for reference of fixing. In addition, the cover glass and seal resin may overlap with the notch of the package.
- e) If the lead bend repeatedly and the metal, etc., clash or rub against the package, the dust may be generated by the fragments of resin.
- f) Acrylate anaerobic adhesives are generally used to attach CCD image sensors. In addition, cyano-acrylate instantaneous adhesives are sometimes used jointly with acrylate anaerobic adhesives. (reference)

5) Others

- a) Do not expose to strong light (sun rays) for long periods, color filters will be discolored. When high luminance objects are imaged with the exposure level control by electronic-iris, the luminance of the image-plane may become excessive and discolor of the color filter will possibly be accelerated. In such a case, it is advisable that taking-lens with the automatic-iris and closing of the shutter during the power-off mode should be properly arranged. For continuous using under cruel condition exceeding the normal using condition, consult our company.
- b) Exposure to high temperature or humidity will affect the characteristics. Accordingly avoid storage or usage in such conditions.
- c) The brown stain may be seen on the bottom or side of the package. But this does not affect the CCD characteristics.
- d) This package has 2 kinds of internal structure. However, their package outline, optical size, and strength are the same.

The cross section of lead frame can be seen on the side of the package for structure A.
