## SONY.

# **CXA1262N**

# Pre-amplifier/Power-amplifier for Tape Recorder

# For the availability of this product, please contact the sales office

#### Description

The CXA1262N is a bipolar IC developed for use in a low voltage monaural tape recorder. It is ideally suited for use in a portable monaural tape recorder.

#### **Features**

- Standard maximum output: 220mW (EIAJ  $8\Omega$  load  $V_{cc} = 2.8V$ )
- Built-in AGC.
- Built-in1.4V regulator. (Maximum load current 20mA)
- Has REC MUTE function.
- Built-in 2-channel (switchable) power amplifier input circuit.
- Built-in audio detection amplifier compatible with a system which starts a recording in response to an audio input.
- Offers outstanding ripple rejection.

#### **Applications**

- Portable type tape recorder
- Dictating machine

#### Absolute Maximum Ratings (Ta=25°C)

#### **Recommended Operating Condition**

24pin VSOP (Plastic)

### **Block Diagram and Pin Configuration**

### **Electrical Characteristics**

(Ta=25°C,  $V_{cc}$ =Specified in the table. Refer to the Electrical Characteristic Test Circuit)

In the electrical characteristic Test circuit, switches are connected to "1" when in the OFF state and "2" when in the ON state.

#### **Description of Operation**

4 REF OUT pin

A low impedance pin for outputting the internal reference voltage. Since it has no capability to supply current, do not use it for any other purpose than to return preamplifier signal.

6 AGC pin

A pin for connecting AGC filter in the REC mode. Attack time is determined by resistor  $750\Omega$  in the IC and the capacity of an external capacitor. Recovery time is determined by an external resistor and capacitor.

VD OUT pin

In the REC mode, the VD OUT pin outputs a 22dB (typical) amplified signal input to the POWER IN. Since a signal input to the REC IN in the REC mode is output with a high amplification factor, the pin can be used as an audio detection amplifier output pin for configuration of a system that starts a recoding operation only when voice is input to a microphone.

12 R/P CONT pin

A pin for changeover between the REC and PB modes. H level (the same potential as REG OUT) causes changeover to the REC mode, whereas L level (GND) causes changeover to the PB mode. The time constant of  $27k\Omega$  and  $1\mu$ F (standard values respectively) provides muting during the REC/PB changeover period.

① ALARM SELECT pin

A pin for selecting power amplifier input signal. H level (the same potential as REG OUT) causes the signal input to the POWER IN to be connected to the power amplifier, whereas L level (GND) causes the signal input to the ALARM IN to be connected to the power amplifier.

4 REC MUTE pin

A pin for control of muting in the REC mode. H level (the same potential as REG OUT) causes recording signal to be output to the RD OUT whereas L level (GND) initiates a record muting operation so that no signal will be available at the RD OUT pin.

(15) REG OUT pin

A regulator output pin. Allows a maximum of 20mA load current to flow.

18 ALARM IN pin

Two power amplifier input pins are provided. One of them is the ALARM IN pin. L level (GND) on the ALARM SELECT pin initiates BTL operation of the power amplifier regardless of the REC/PB modes so that the signal input to the ALARM IN pin is amplified and output.

19 POWER IN pin

One of the two power amplifier input pins. H level (the same potential as REG OUT) on the ALARM SELECT pin initiates BTL operation of the power amplifier in the PB mode to drive the speaker. In the REC mode, H level on the ALARM SELECT pin allows a signal to be output from the OUT (A) pin for earphone monitoring, only when a plug is inserted into the earphone jack. In this case, the speaker is not driven. Input sensitivity of POWER IN pin is the same as that of ALARM IN pin.

② RD IN pin

An input pin for the recording head drive amplifier. Designed so that when a  $10k\Omega$  external resistor is connected between the RD IN and REF OUT pins, changes in the DC potential at the RD OUT pin that may result from changeover of recording muting between ON/OFF will be reduced to a minimum.

24 PB IN pin

A pin for inputting the signal of the PB head in the PB mode. DC bias for the PB IN pin is given by connecting one side of the PB head to the REF OUT pin.

The following table shows the potentials at Pins ②, ③ and ④ and the associated operating states of the amplifier. Each of the pins, when at the same potential as Pin ⑤, has H level, and when at the same as Pin ②, has L level.

#### **System Control Operation Table**

<sup>\*</sup> If an earphone plug is inserted into the earphone jack with R/P CONT (Pin (12)) and ALARM SELECT (Pin (13)) in the H state, the speaker will be disconnected from the OUT (A) (Pin 10) and OUT (B) (Pin 8). In this state, the POWER IN SELECTOR (A) selects the signal input to the POWER IN (Pin (19)) and transmits it to the POWER AMP (A) so that what is being recorded can be monitored with the earphone.

Application Circuit

Application circuits shown are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits or for any infringement of third party patent and other right due to same.

#### Package Outline Unit: mm

#### 24pin VSOP (Plastic) 275mil
