

DD Dolby B/C Type Noise Reduction System with Playback Equalizer

For the availability of this product, please contact the sales office.

Description

The CXA1911Q is an IC designed for use in car stereo cassette decks. Functions include Dolby B/C type noise reduction, playback equalizer amplifier and music sensor into a single chip.

Features

- Few external parts
- Forward/Reverse head switching
- Small package (40-pin QFP)
- Dolby B/C type noise reduction and playback equalizer into a single chip
- Same pin configuration as Dolby B type noise reduction system (CXA1910Q)
- Music sense level can be set by external resistors/capacitors (2 modes).
- High-band cut filter frequency can be adjusted by the external capacitance.

Applications

- Car stereo cassette decks
- Cassette decks (playback only)

Structure

Bipolar silicon monolithic IC

Absolute Maximum Ratings (Ta=25°C)

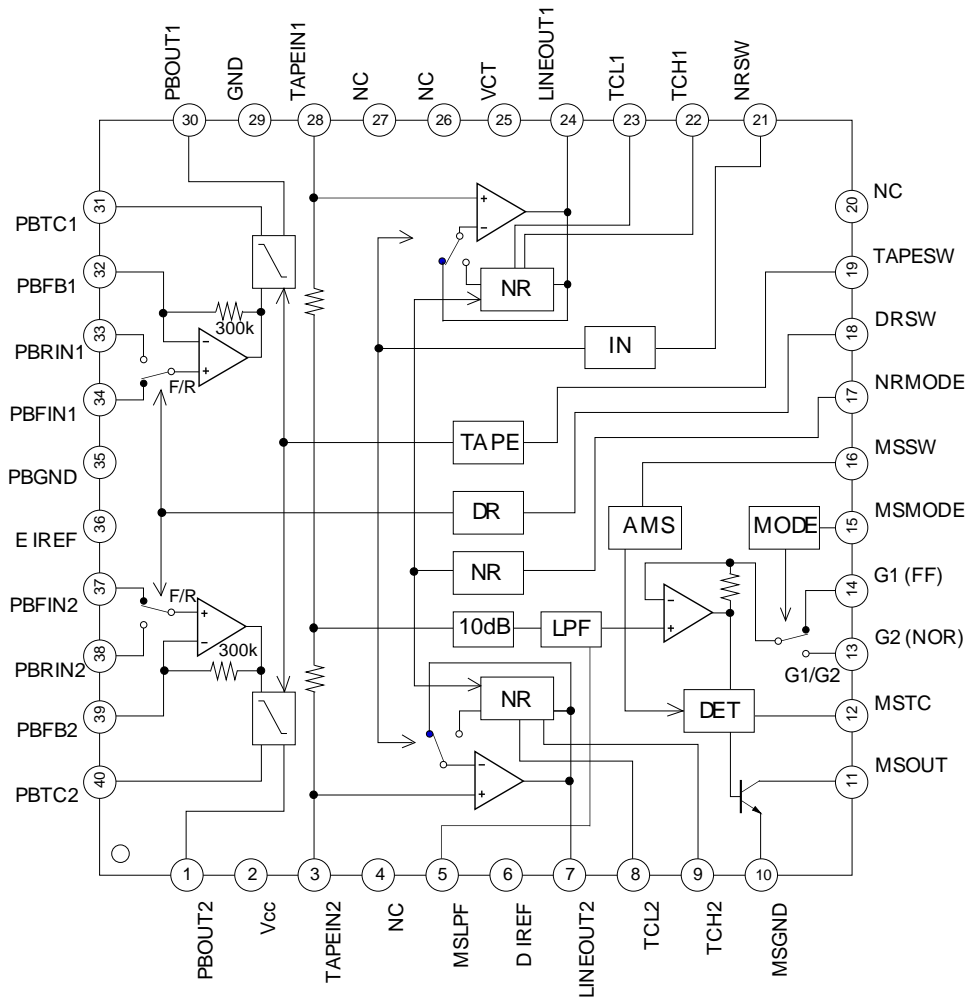

• Supply voltage	VCC	12	V
• Operating temperature	Topr	-40 to +85	°C
• Storage temperature	Tstg	-65 to +150	°C
• Allowable power dissipation	PD	430	mW

Recommended Operating Conditions

• Supply voltage	VCC	7.8 to 11	V

Block Diagram

Pin Description

(Ta=25°C, V_{CC}=8.0V, no signal)

Pin No.	Symbol	DC value	Z (in)	Equivalent circuit	Description
1 30	PBOUT	2.1V	—	Refer to Page 7.	PBEQ output
32 39	PBFB	2.1V	300kΩ		PBEQ feedback
33 34 37 38	PBIN	0V	—		PBEQ input
2	V _{CC}	8.0V	—	—————	Power supply
3 28	TAPEIN	4.0V	40kΩ		TAPE input
4 20 26 27	NC	—	—		No connection
5	MSLPF	4.0	100kΩ		Adjustment of MS LPF frequency

Pin No.	Symbol	DC value	Z (in)	Equivalent circuit	Description
6	D IREF	1.25V	—		Connection of reference current setting resistor for Dolby block
7 24	LINEOUT	4.0V	—		Line output
8 23	TCL	0.3V	—		Time Constant pin for the LLS
9 22	TCH	0.3V	—		Time Constant pin for the HLS
10 29 35	MSGND GND PBGND	0.0V	—		Ground

Pin No.	Symbol	DC value	Z (in)	Equivalent circuit	Description
11	MSOUT	0.2 V for signal detection; 5.0 V for no signal detection	—		MS output
12	MSTC	Approx. 1.4 V for signal detection; 5.0 V for no signal detection	—		Connection of MS detection time constant
13 14	G2(NOR) G1(FF)	4.0V	—		MS feedback
15	MSMODE	—	—		MSMODE MS gain selector G1 when high, G2 when low
18	DRSW				DRSW Head selector Reverse when high, Forwards when low
19	TAPESW				TAPESW Equalizer selector 120µs when high, 70µs when low
21	NRSW				NRSW NR ON/OFF selector
16	MSSW	—	—		MS on/off selector MS on when high, MS off when low

Pin No.	Symbol	DC value	Z (in)	Equivalent circuit	Description
17	NRMODE	—	—		Noise reduction selector C when high, B when low
25	VCT	4.0V	—		Vcc/2 output
31 40	PBTC	—	—		PBEQ capacitance
36	E IREF	1.25V	—		Connection of reference current setting resistor for PBEQ block

- PBOUT, PBFB, PBIN equivalent circuit

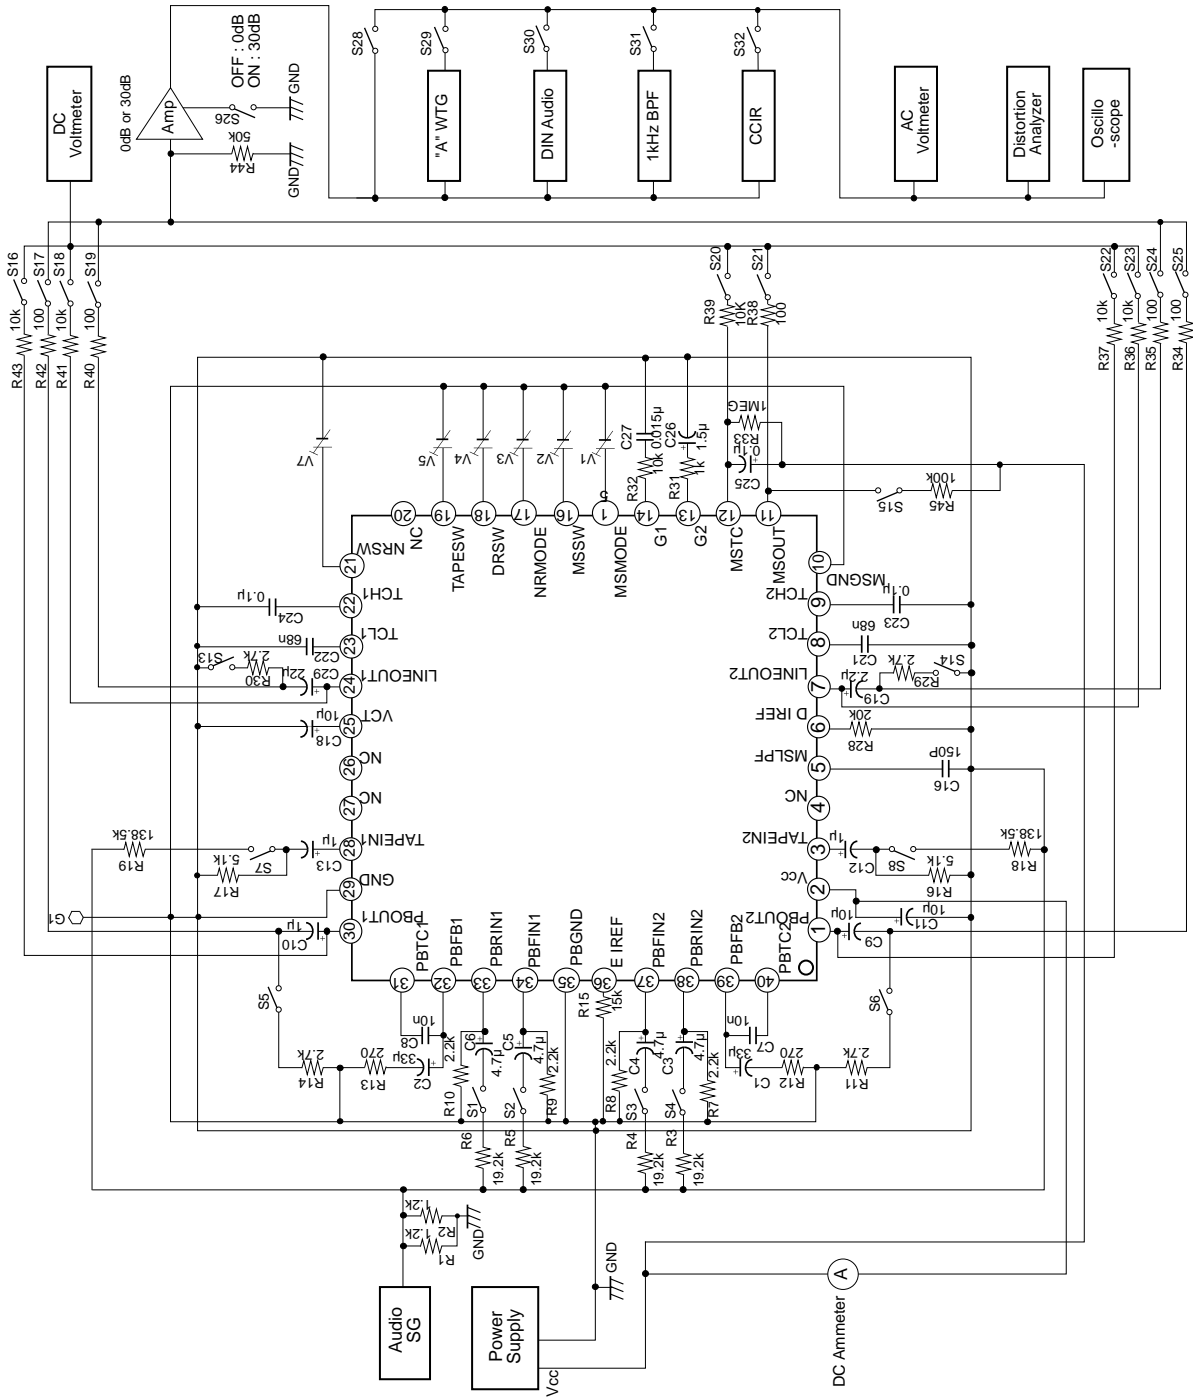

Electrical Characteristics (Ta=25°C, V_{CC}=8.0 V, R_L: output load resistance, R_g: head equivalent impedance; unless otherwise specified, 120 μs, FWD mode, NR OFF, MS OFF)

Item	Symbol	Measurement conditions (input pin, input level frequency etc.)	Min.	Typ.	Max.	Unit

Boost charge OFF VCT level	VCRG2	No signal, VCT level when boost charge OFF	3.6	—	—	

Electrical Characteristics Measurement Circuit

Operating modes (TAPESW, DRSW, NRSW, MSSW, MODESW, NRMODE)

The CXA1911Q has an NR switch (NRSW), NR mode switch (NRMODE), equalizer switch (TAPESW), head switch (DRSW), MS switch (MSSW), and MS gain switch (MSMODE).

The operating modes for each switch are shown in the following table.

SW	Function for Low input	Function for High input
NRSW	NR OFF	NR (B/C) ON
NRMODE	DOLBY B	DOLBY C
TAPESW	70 μ S	120 μ s
DRSW	PB FWD	PB RVS
MSSW	MS OFF	MS ON
MSMODE	G2 MODE	G1 MODE

Click noise can be reduced by the external CR time constant for NRSW switching.

Description of Operation

1. Signal route

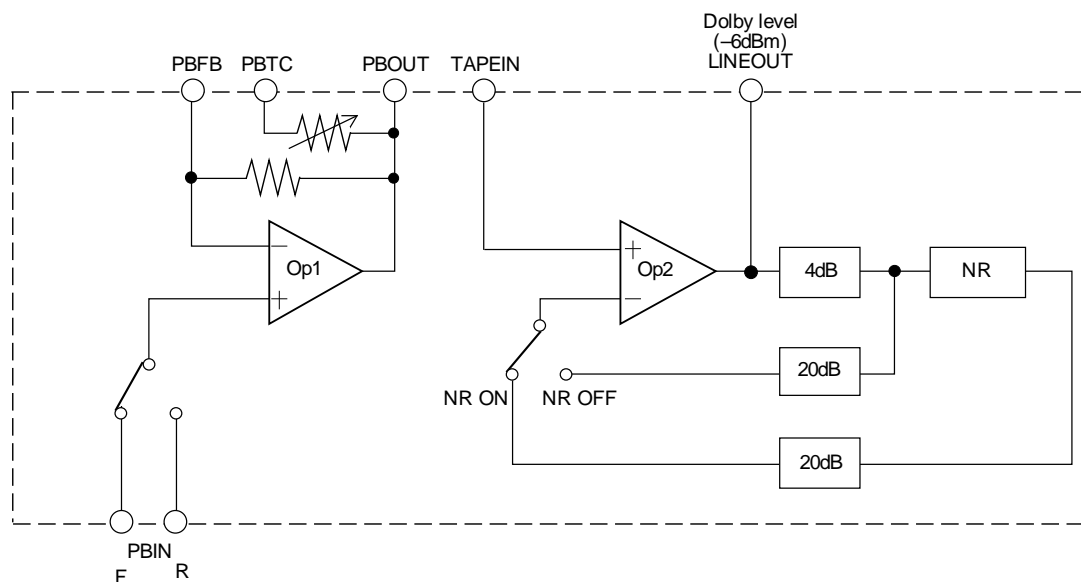

Fig. 1

Op1 and Op2 are operational amplifiers.

Op1 composes the playback equalizer by attaching a resistor and a capacitor to PBFB pin, and a capacitor to PBTC pin.

Op2 is an input selector and a LINEOUT amplifier. The gain is 24 dB.

The Dolby reference level is -6 dBm (LINEOUT).

The adjustment method of playback equalizer is described in the paragraph (3).

Note) Usually the TAPEIN pin level is adjusted by attenuator connected to PBOUT pin.

The capacitance value connected to PBFB can be reduced by adjusting the resistance connected to PBFB to match the PBOUT level.

With this method, the capacitance value can be reduced according to the amount that the resistance value is increased even for the same cut-off frequency.

(These specifications use the latter method.)

2. Level diagram

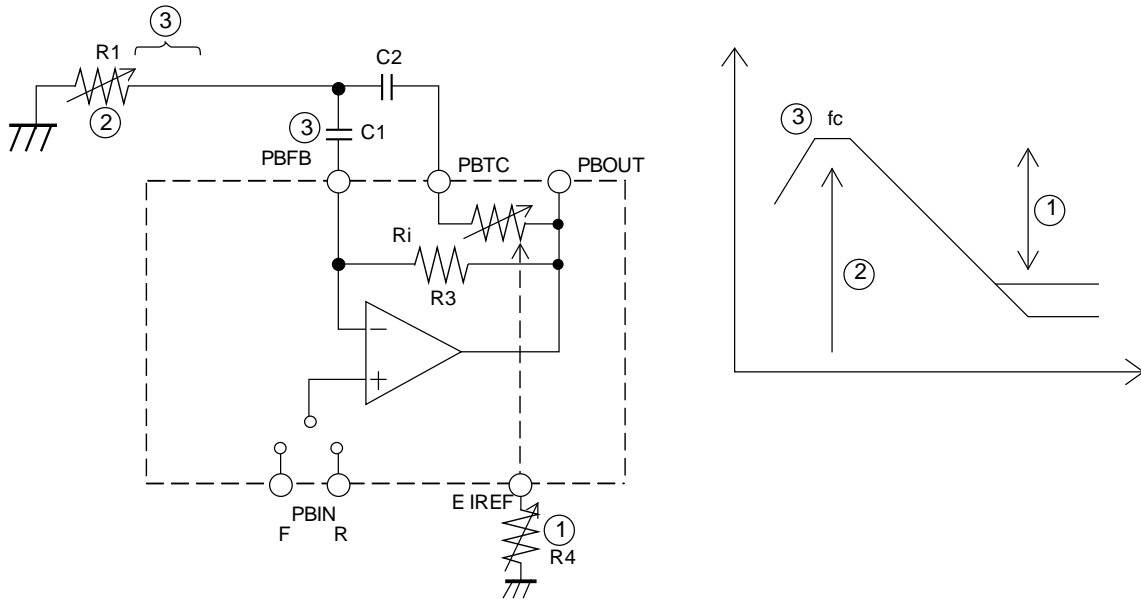

Fig.2

Note) This diagram illustrates the case where the Dolby level is aligned by adjusting the resistance value connected to PBFB.

3. PBEQ adjustment

- 1) EQ curve gain difference (=adjustment of internal variable R) → IREF resistor
To adjust the EQ curve gain differences (G1 – G2, G1 – G3), the E IREF resistor should be adjusted to change the internal variable resistance value.
- 2) AC gain → External resistor R1
The external resistor R1 should be adjusted to adjust the AC gain.
G1 is obtained by the following equation.

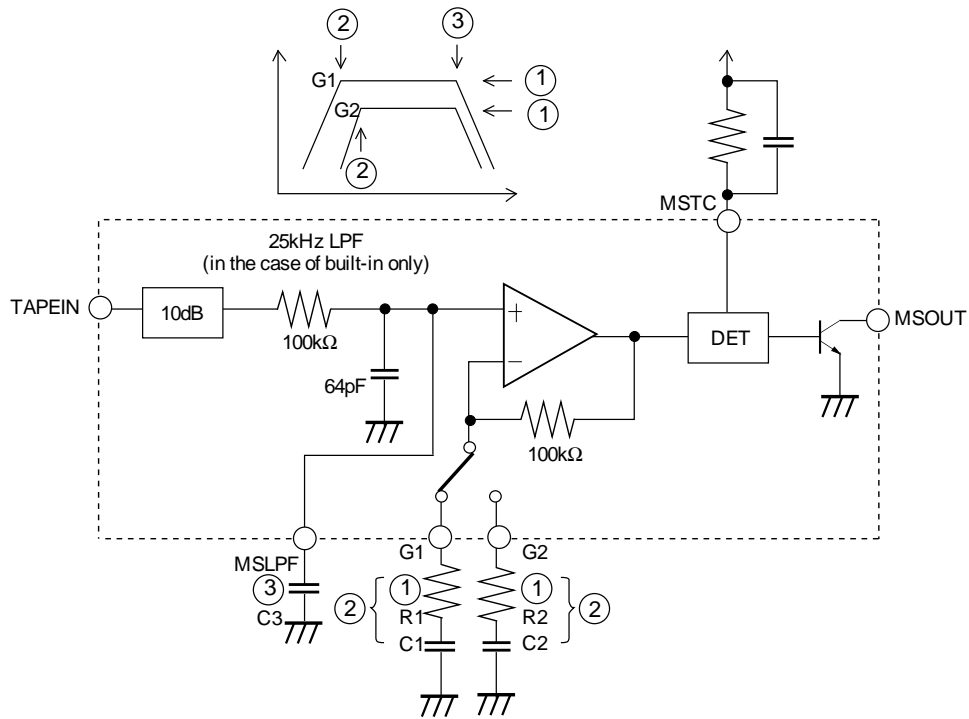

$$G1 = 20 \log \frac{R1 + R3}{R1} \quad (R3 = 300k\Omega)$$

- 3) Low-band cut-off frequency → External resistor R1 and capacitor C1
The low-band cut-off frequency (fc) can be determined by the external resistor R1 and external capacitor C1.

Note) In this diagram, C1 and R1 are not connected in series, but are connected to PBFB from between R1 and C2.

This is to prevent the sound quality from deteriorating when using an electrolytic capacitor.

4. MS (internal detection between tracks) adjustment method

- 1) MS gain (FF/NOR mode gain) adjustment → External resistors R1 and R2
MS gain is expressed by the following equations.

$$G1 = 10 + 20\log \frac{R1 + 100k}{R1} \text{ [dB]} \qquad G2 = 10 + 20\log \frac{R2 + 100k}{R2} \text{ [dB]}$$

- 2) MS low-band cut-off frequency adjustment → External resistors R1 and R2 and external capacitors C1 and C2
The external resistors R1 and R2 and external capacitors C1 and C2 should be adjusted to adjust the low-band cut-off frequency for the MS frequency response.
- 3) MS high-band cut-off frequency adjustment → External capacitor C3
The external capacitor C3 should be adjusted to adjust the high-band cut-off frequency for the MS frequency response. (In this case, G1 and G2 have the same cut-off frequency.)
