

MAS9078

AM Receiver IC

- High Sensitivity
- Very Low Power Consumption
- Wide Supply Voltage Range
- Power Down Control
- Control for AGC On
- High Selectivity by Crystal Filter
- Fast Startup Feature

DESCRIPTION

The MAS9078 AM-Receiver chip is a highly sensitive, simple to use AM receiver specially intended to receive time signals in the frequency range from 40 kHz to 100 kHz. Only a few external components are required for time signal receiver. The circuit has preamplifier, wide range automatic gain control, demodulator and output comparator

built in. The output signal can be processed directly by an additional digital circuitry to extract the data from the received signal. The control for AGC (automatic gain control) can be used to switch AGC on or off if necessary. Unlike MAS1016A and MAS1016B, MAS9078 does not require AGC control procedure in WWVB and JJY systems.

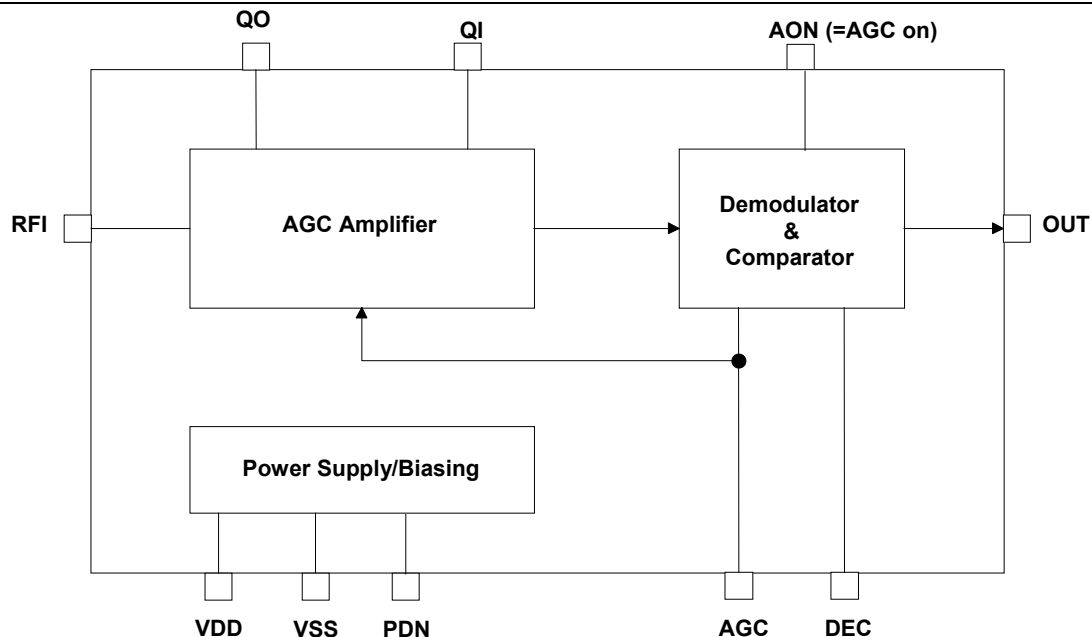

FEATURES

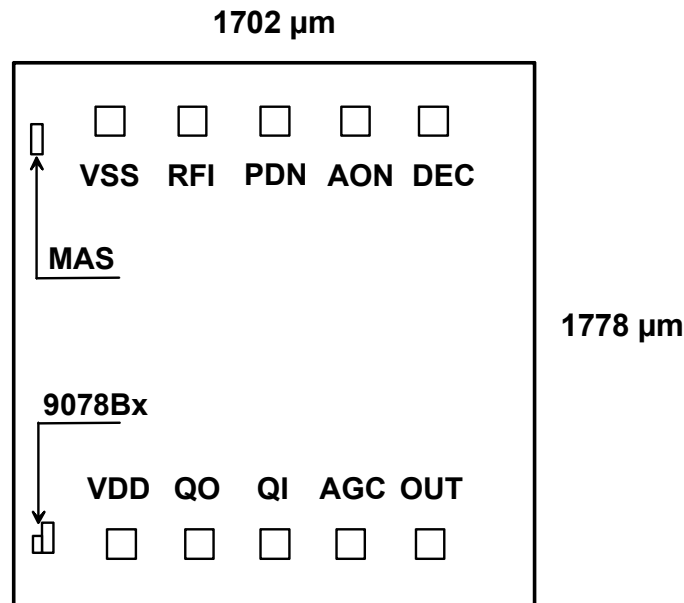

- Highly Sensitive AM Receiver, 0.4 μV_{RMS} typ.
- Wide Supply Voltage Range from 1.1 V to 3.6 V
- Very Low Power Consumption
- Power Down Control
- Fast Startup
- Only a Few External Components Necessary
- Control for AGC On
- Wide Frequency Range from 40 kHz to 100 kHz
- High Selectivity by Quartz Crystal Filter
- Die and TSSOP-16 Package

APPLICATIONS

- Time Signal Receiver WWVB (USA), JJY (Japan), DCF77 (Germany) and MSF (UK)
- Receiver for ASK Modulated Data Signals

BLOCK DIAGRAM

PAD LAYOUT

DIE size = 1.70 x 1.78 mm; PAD size = 100 x 100 μm

Note: Because the substrate of the die is internally connected to VDD, the die has to be connected to VDD or left floating. Please make sure that VDD is the first pad to be bonded. Pick-and-place and all component assembly are recommended to be performed in ESD protected area.

Note: Coordinates are pad center points where origin has been located in the center of VDD pad

Note: The on-chip product code 9078Bx identifies internal compensation capacitance option. x has values 1, 2, 3, 4 or 5 referring to capacitance option described in the Table 2 on page 4.

Pin Description	Name	X-coordinate	Y-coordinate	Note
Power Supply Voltage	VDD	0 μm	0 μm	
Quarz Filter Output	QO	306 μm	19 μm	
Quarz Filter Input	QI	586 μm	19 μm	
AGC Capacitor	AGC	866 μm	19 μm	
Receiver Output	OUT	1109 μm	19 μm	1
Demodulator Capacitor	DEC	1109 μm	1428 μm

Receiver Input	RFI	306 μm	1428 μm	
Power Supply Ground	VSS	16 μm	1407 μm	

Notes:

- 1) OUT = VSS when carrier amplitude at maximum; OUT = VDD when carrier amplitude is reduced (modulated)
 - the output is a current source/sink with $|I_{OUT}| > 5 \mu\text{A}$
 - at power down the output is pulled to VSS (pull down switch)
- 2) AON = VSS means AGC off (hold current gain level); AON = VDD means AGC on (working)
 - Internal pull-up with current $< 1 \mu\text{A}$ which is switched off at power down
- 3) PDN = VSS means receiver on; PDN = VDD means receiver off
 - Fast start-up is triggered when the receiver is after power down (PDN=VDD) controlled to power up (PDN=VSS) i.e. at the falling edge of PDN signal.

TYPICAL APPLICATION

Note 1: Crystal

The crystal as well as ferrite antenna frequencies are chosen according to the time-signal system (Table 1). The crystal shunt capacitance C_0 should be matched as well as possible with the internal shunt capacitance compensation capacitance C_C . MAS9078 has five compensation capacitance options. Capacitance values and suitable crystals are described in Table 2. See also Ordering Information (p.10).

Time-Signal System	Location	Antenna Frequency	Recommended Crystal Frequency
DCF77	Germany	77.5 kHz	77.503 kHz
MSF	United Kingdom	60 kHz	60.003 kHz
WWVB	USA	60 kHz	60.003 kHz
JJY	Japan	40 kHz and 60 kHz	40.003 kHz and 60.003 kHz

Table 1 Time-Signal System Frequencies

Device	C_C	Crystal Description
MAS9078B1	0.75 pF	For single low C_0 crystal (Nominal value)
MAS9078B2	1.25 pF	For single high C_0 crystal
MAS9078B3	1.625 pF	For two parallel low C_0 crystals (dual band receiver)
MAS9078B4	2.5 pF	For two parallel high C_0 crystals (dual band receiver)
MAS9078B5	3.875 pF	Any crystal with parallel external compensation capacitor

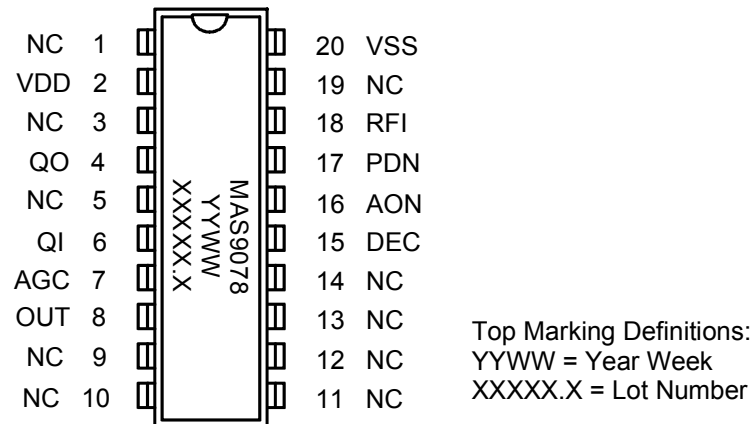

Table 2 Compensation Capacitance Options

Note 2: AGC Capacitor

The AGC and DEC capacitors must have low leakage currents due to very small 40 nA signal currents through the capacitors. The insulation resistance of these capacitors should be higher than 70 M Ω . Also probes with at least 100 M Ω impedance should be used for voltage probing of AGC and DEC pins.

Note 3: Power Down / Fast Startup Control

Both power down and fast startup are controlled using the PDN pin. The device is in power down (turned off) if PDN = VDD and in power up (turned on) if PDN = VSS. Fast startup is triggered by the falling edge of PDN signal, i.e., controlling device from power down to power up. The startup time without using the fast startup control can be several minutes but with fast startup it is shortened typically to 12 s.
