

**Description**

The CXA2610AN is a laser driver IC for optical discs. This IC supports higher optical power output speeds.

**Features**

- LD driver with excellent driving capability
- Write current of 250mA (max.) possible by setting the IIN2 (Pin 2) and IIN3 (Pin 5) external resistors
- Rise time  $\approx$  3ns
- Fall time  $\approx$  4ns
- The oscillation frequency of the built-in oscillation circuit can be set from 100 to 600MHz by connecting the OSCFR (Pin 4) external resistor to GND.
- The oscillator amplitude initial value of the built-in oscillation circuit can be set by connecting the OSCGA (Pin 12) external resistor to GND, and the oscillator amplitude can be adjusted by the IINR input current value.
- Oscillation ON/OFF can be set as desired.
- Single +5V power supply
- TTL/CMOS control for control system

**Applications**

- CD-R driver
- CD-RW driver
- DVD driver
- Writable optical driver
- Laser diode current switching

**Structure**

Bipolar silicon monolithic IC

**Absolute Maximum Ratings**

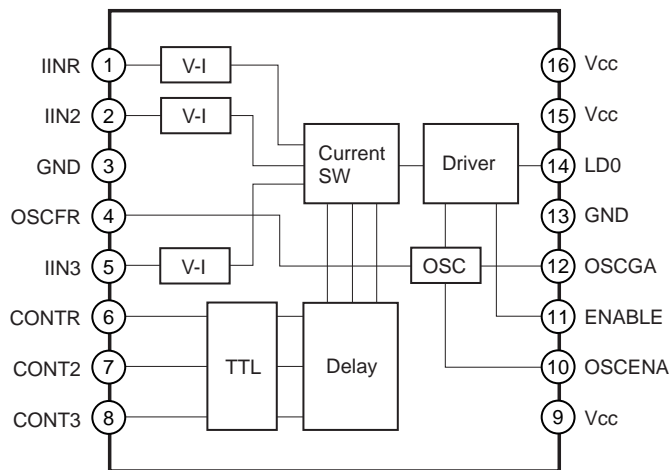

• Supply voltage	Vcc	5.5	V
• Operating temperature	Topr	-10 to +70	°C
• Storage temperature	Tstg	-65 to +150	°C

**Operating Conditions**

Supply voltage	4.5 to 5.5	V
----------------	------------	---

**Block Diagram**

**Pin Description**

Pin No.	Symbol	I/O	Description
1	IINR	I	Oscillation level adjustment.
2	IIN2	I	LD drive current setting input.
3	GND	—	Ground.
4	OSCFR	I	Oscillation frequency adjustment.
5	IIN3	I	LD drive current setting input.
6	CONTR	I	LD drive current output setting.
7	CONT2	I	LD drive current output setting.
8	CONT3	I	LD drive current output setting.
9	Vcc	—	Vcc.
10	OSCENA	I	Oscillation ON for read/forced oscillation ON control.
11	ENABLE	I	LD drive current ON/OFF control. (High: ON, Low: OFF)
12	OSCGA	I	Oscillation level initial value setting.
13	GND	—	Ground.
14	LD0	O	LD anode side connection.
15	Vcc	—	Vcc.
16	Vcc	—	Vcc.

(Ta = 25°C, Vcc = 5V)

Electrical Characteristics Measurement Circuit

**Description of Functions**

**(1) LD drive current value setting**

The current controlled by the current setting pins IINR, IIN2 and IIN3 is output from the LD0 pin.  
 The current flowing to the LD0 pin can be set independently for IINR, IIN2 and IIN3 by CONTR, CONT2 and CONT3.

**(2) LD drive current forced OFF**

Forced OFF is enabled by setting the ENABLE pin Low.

**(3) Oscillation circuit**

The oscillation circuit is turned ON forcibly by setting the OSCENA pin Low.  
 $(\overline{\text{OSCENA}} \times \text{CONTR} \times (\text{CONT2} + \text{CONT3}))$   
 The oscillation circuit is turned ON by setting the OSCENA pin High only for read.  
 $(\text{OSCENA} \times \text{CONTR} \times \text{CONT2} \times \text{CONT3})$

**(4) Oscillation frequency adjustment**

The oscillation frequency can be varied by the external resistance value connected to the OSCFR pin.

**(5) Oscillation level adjustment**

The oscillation level initial value can be set by the external resistance value connected to the OSCGA pin.  
 The oscillation level can be adjusted by varying the IINR input current value.  
 In addition, the read block DC compensation current  $I_R$  that flows when oscillation is OFF is independent of the OSCGA pin external resistance value, and is constant.

$$I_o \approx \frac{\text{OSCGA pin voltage}}{\text{OSCGA external resistance}} \times \frac{40}{9} \text{ [mAp-p]}$$

**(6) Logic**

The logic table for the CONTR, CONT2, CONT3 and ENABLE pins is shown below.  
 Be sure to also check the timing chart on page 7.

ENABLE	CONTR	CONT2	CONT3	LD0
L	X	X	X	OFF
H	H	H	H	OFF
H	L	H	H	IINR
H	L	L	H	IINR + IIN2
H	L	H	L	IINR + IIN3
H	L	L	L	IINR + IIN2 + IIN3

**Notes on Operation**

- Locate the external resistors connected to the IINR, IIN2 and IIN3 pins close to the IC package to prevent the effect from other signal lines.
- Make the wiring distance between the output LD0 pin and the laser diode as short as possible. If this wiring is longer, the output waveform characteristics show that the rise and fall times (Tr and Tf) become slower as the ringing becomes larger.
- The external resistor connected to Pin 10 (OSCGA) should be within the range from 12Ω to 2kΩ. In addition, this resistance value should be set in consideration of the laser diode Ith so that the oscillation level at IINR = 0V does not exceed the read power.
- Temperature assurance

The junction temperature for the CXA2610AN laser driver should not exceed 150°C. In addition, the power consumption (Po) should be the allowable power dissipation (Pd) or less, and the IC should be used with a lowered thermal resistance (θj-a) for board mounting so that normal operation is possible at the maximum operating temperature of 70°C.

Widening the GND area on the set board and other heat radiation countermeasures within the set are necessary in order to lower θj-a.

This is because the CXA2610AN thermal resistance (θj-a) differs according to the board, and the power consumption (Po) is also difficult to predict with future increases in power.

Obtain the thermal resistance (θj-a) and power consumption (Po) of the package by the following method.

Power consumption (Po): Oscillator ON state (OSC level = 47mAp-p)

$$P_o = (I_{cc2} + (\text{total of each input current} \times 10)) \times V_{cc} + (I_{OP} \times (V_{cc} - V_{OP}))$$

I<sub>cc2</sub>: See page 3 of this Data Sheet.

I<sub>OP</sub>: Output drive current flowing from the LD0 pin to the laser diode

V<sub>OP</sub>: Laser diode operating voltage

or, the power consumption can also be obtained as follows.

$$P_o = (I_{cc} \times V_{cc}) - (I_{OP} \times V_{OP})$$

I<sub>cc</sub>: Device current consumption (including I<sub>OP</sub>) during operation

Thermal resistance (θj-a) when mounted on a board

The diode temperature coefficient is -2.27mV/°C

- (1) ENABLE pin voltage – V<sub>cc</sub> pin voltage after applying 0V to the IINR, IIN2 and IIN3 pins = V1
- (2) ENABLE pin voltage – V<sub>cc</sub> pin voltage immediately after applying 3V to IINR = V2
- (3) ENABLE pin voltage – V<sub>cc</sub> pin voltage after applying 3V to the IINR pin and reaching a thermally balanced state = V3

The change in current consumption between (1) and (2)  $\Delta I_{cc} = (3V / (R_{ext} + 250\Omega)) \times 104$ .

This  $\Delta I_{cc}$  causes the ENABLE pin internal forward protective diode connection V<sub>cc</sub> voltage to vary ( $\Delta V_{cc}$ ) due to the effects of the wiring resistance from the V<sub>cc</sub> pin voltage which is used as the reference.

The voltage fall coefficient (VR) used to correct this  $\Delta V_{cc}$  can be obtained by  $VR = (V1 - V2) / \Delta I_{cc}$ . Using VR to apply correction to V3 yields the equation:

$$(\Delta I_{cc} \times VR) + V3 = V4.$$

From this,  $\Delta T_j = (V4 - V2) \text{ mV} / -2.27\text{mV}/^\circ\text{C}$ , and  $\theta_{j-a} = \Delta T_j / P_o [^\circ\text{C}/\text{W}]$ .

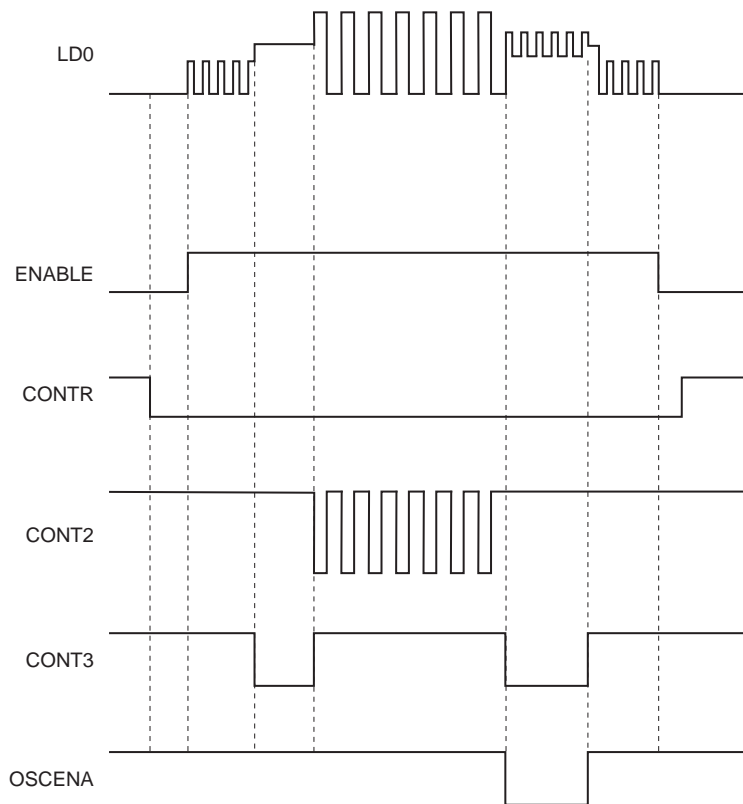

- Allowable power dissipation (Pd) ≥ Po [W]  
Pd = (150°C – ambient temperature)/θj-a
- Maximum operating temperature 70 °C  
(150°C – ΔTj) ≥ 70°C

Thus, if θj-a can be lowered from these two conditions, the maximum operating temperature can also be raised.

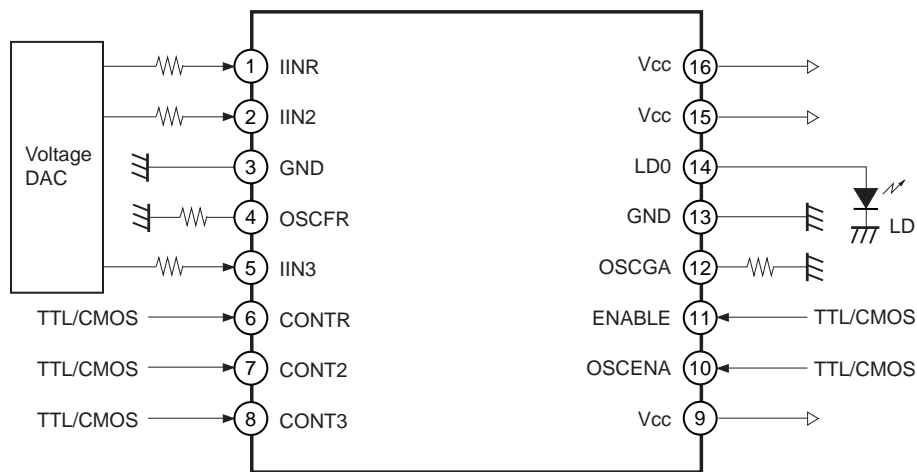

**Thermal Resistance Measurement Circuit**

Timing Chart

Application Circuit

Application circuits shown are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits or for any infringement of third party patent and other right due to same.

Example of Representative Characteristics

High frequency oscillator amplitude vs. Read current characteristics

High frequency oscillator amplitude frequency dependence (OSCGA = 20Ω)

Package Outline

Unit: mm

16PIN SSOP (PLASTIC)

NOTE: Dimension "\*" does not include mold protrusion.

PACKAGE STRUCTURE

SONY CODE	SSOP-16P-L01
EIAJ CODE	SSOP016-P-0044
JEDEC CODE	_____

PACKAGE MATERIAL	EPOXY RESIN
LEAD TREATMENT	SOLDER / PALLADIUM PLATING
LEAD MATERIAL	42/COPPER ALLOY
PACKAGE MASS	0.1g

NOTE : PALLADIUM PLATING

This product uses S-PdPPF (Sony Spec.-Palladium Pre-Plated Lead Frame).
