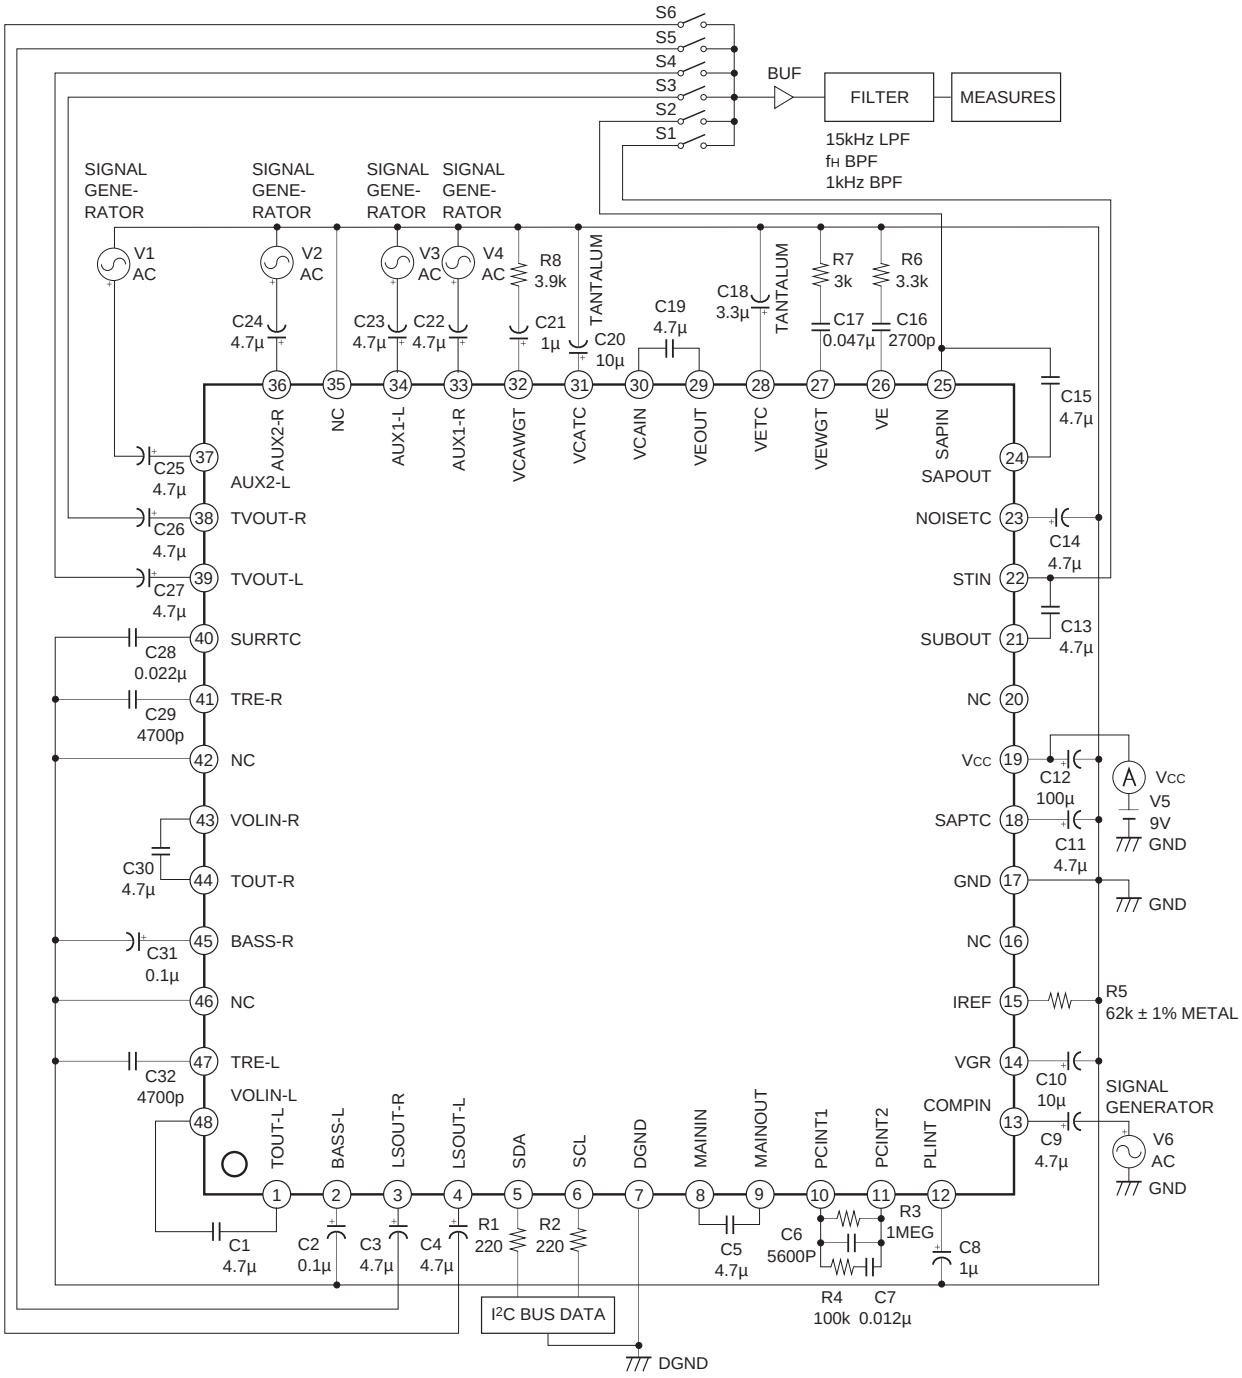
Electrical Characteristics Measurement Circuit



Adjustment Method

The resister data is set to the standard value.

1. ATT adjustment
   1) Input a 100Hz, 245mVrms sine wave signal to COMPIN and monitor the TVOUT-L output level. Then, adjust the “ATT” data for ATT adjustment so that the TVOUT-L output goes to the standard value (490mVrms).
   2) Adjustment range: ±20%
      Adjustment bits: 4 bits

2. Separation adjustment
   1) Input ST-L signal (modulation factor 30%, frequency 300Hz NR-ON) to COMPIN. At this time, adjust the “WIDEBAND” adjustment data to reduce TVOUT-R output to the minimum.
   2) Next, set the frequency only of the input signal to 3kHz and adjust the “SPECTRAL” adjustment data to reduce TVOUT-R output to the minimum.
   3) The adjustments in 1 and 2 above are performed to optimize the separation.
   4) “WIDEBAND” “SPECTRAL”
      Adjustment range: ±30% Adjustment range: ±15%
      Adjustment bits: 6 bits Adjustment bits: 6 bits

Note) Adjust this IC through tuner and IF when this IC is mounted on the set.

(SAP) : The SAPOUT output signal is soft muted (approximately –7dB).
The signal is soft muted when NOISE = 1.

* : Don't care.

*1 SAP or NOISE discrimination may be made during MONO or STEREO input when the noise is input in the weak electric field.
Then microcomputer reads "NOISE" status from IC and decides whether SAP is output.
"NOISE" status rises earlier than "SAP" status when the amount of noise is increased to COMPIN.

Description of Operation

The US audio multiplexing system possesses the base-band spectrum shown in Fig. 1.

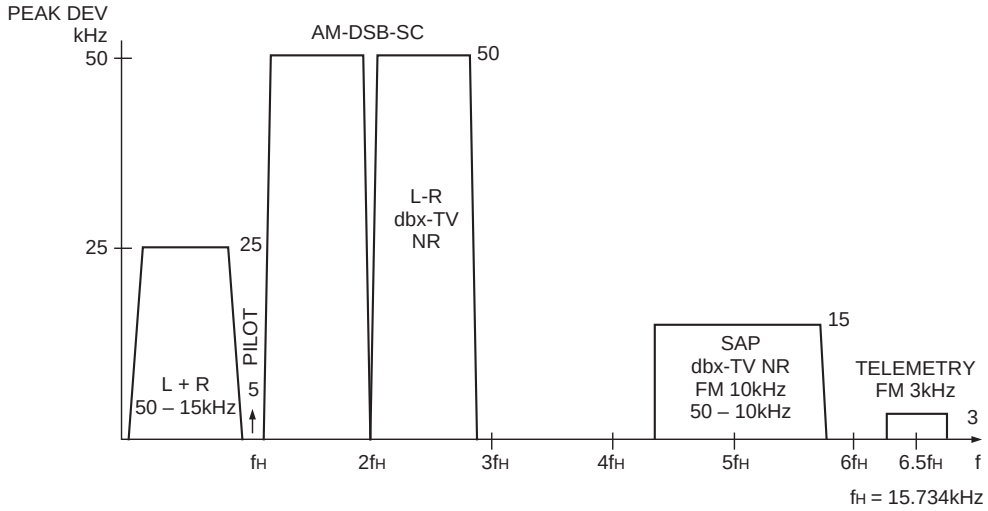

Fig. 1. Base-band spectrum

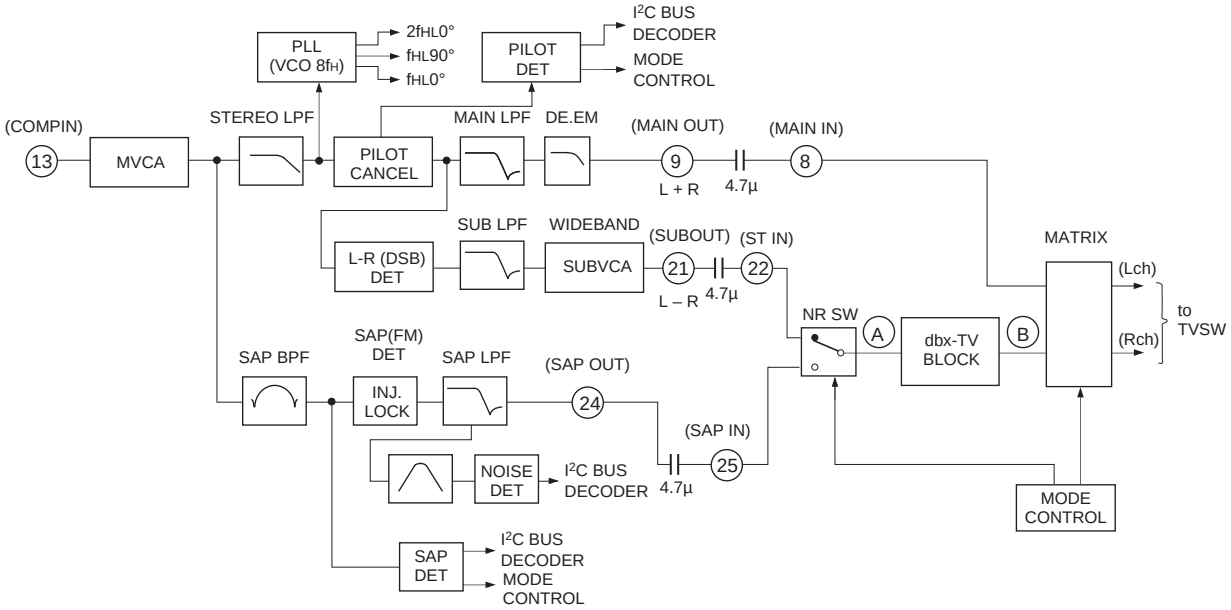

Fig. 2. Overall block diagram (See Fig. 3 for the dbx-TV block)

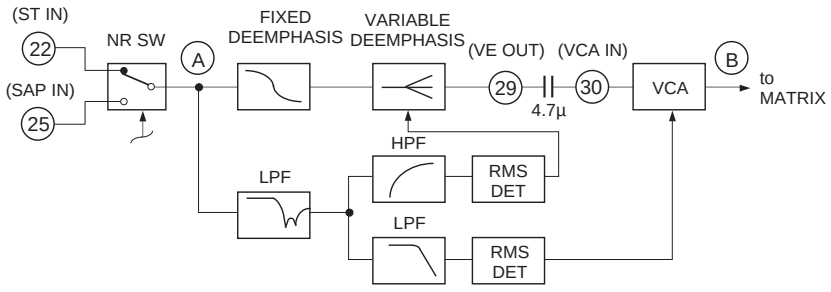

Fig 3. dbx-TV block

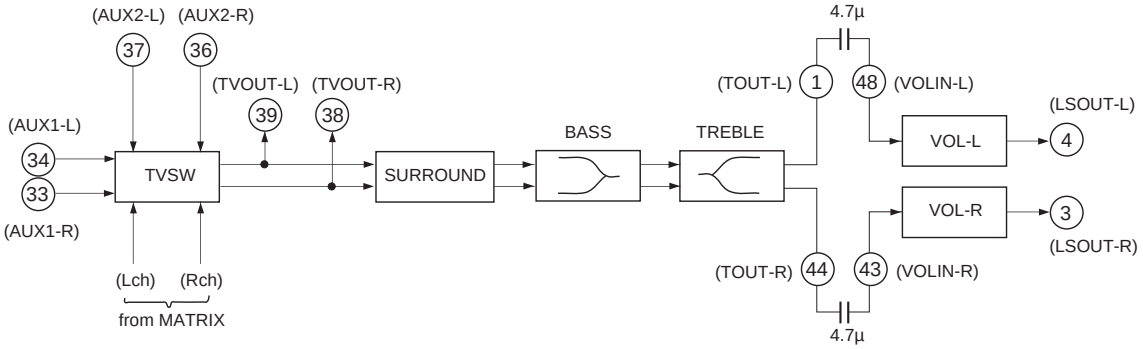

Fig. 4. Sound processor block

(1) L + R (MAIN)

After the audio multiplexing signal input from COMPIN (Pin 13) passes through MVCA, the SAP signal and telemetry signal are suppressed by STEREO LPF. Next, the pilot signals are canceled. Finally, the L – R signal and SAP signal are removed by MAIN LPF, and the frequency response is flattened (de-emphasized) and input to the matrix.

(2) L – R (SUB)

The L – R signal follows the same course as L + R before the pilot signal is canceled. L – R has no carrier signal, as it is a suppressed-carrier double-sideband amplitude modulated signal (DSB-AM modulated). For this reason, the pilot signal is used to regenerate the carrier signal (quasi-sine wave) to be used for the demodulation of the L – R signal. In the last stage, the residual high frequency components are removed by SUB LPF and the L – R signal is input to the dbx-TV block via the NRSW circuit after passing through SUBVCA.

(3) SAP

SAP is an FM signal using $5f_H$ as a carrier as shown in the Fig. 1. First, the SAP signal only is extracted using SAP BPF. Then, this is subjected to FM detection. Finally, residual high frequency components are removed and frequency response flattened using SAP LPF, and the SAP signal is input to the dbx-TV block via the NRSW circuit. When there is no SAP signal, the Pin 24 output is soft muted.

(4) Mode discrimination

Stereo discrimination is performed by detecting the pilot signal amplitude. SAP discrimination is performed by detecting the $5f_H$ carrier amplitude. NOISE discrimination is performed by detecting the noise near 25kHz after FM detection of SAP signal.

(5) dbx-TV block

Either the L – R signal or SAP signal input respectively from ST IN (Pin 22) or SAP IN (Pin 25) is selected by the mode control and input to the dbx-TV block.

The input signal then passes through the fixed de-emphasis circuit and is applied to the variable de-emphasis circuit. The signal output from the variable de-emphasis circuit passes through an external capacitor and is applied to VCA (voltage control amplifier). Finally, the VCA output is converted from a current to a voltage using an operational amplifier and then input to the matrix.

The variable de-emphasis circuit transmittance and VCA gain are respectively controlled by Each of effective value detection circuits. Each of the effective value detection circuits passes the input signal through a predetermined filter for weighting before the effective value of the weighted signal is detected to provide the control signal.

(6) Matrix, TVSW

The signals (L + R, L – R, SAP) input to “MATRIX” become the outputs for the ST-L, ST-R, MONO and SAP signals according to the BUS data and whether there is ST / SAP discrimination.

“TVSW” switches the “MATRIX” output signal, external input signal (input to AUX1-L, R), external input signal (input to AUX2-L, R) and external forced MONO.

(7) Sound processor block

The sound processor block contains "SURROUND" (quasi-surround function), “BASS/TREBLE” tone control functions, and “VOLUME”.

• Surround

At "SURROUND", the L and R differential components are phase-shifted and these components are added to the left and right channels.

When surround is OFF (SURR = 0)

Inputs are output as is.

$$\begin{cases} Lout = Lin \\ Rout = Rin \end{cases}$$

When surround is ON (SURR = 1)

$$\begin{cases} Lout = Lin - \dfrac{1 - j\omega RC}{1 + j\omega RC} \ (Lin - Rin) \\ Rout = Rin + \dfrac{1 - j\omega RC}{1 + j\omega RC} \ (Lin - Rin) \end{cases}$$

$$\begin{cases} R = 24k\Omega \text{ (On-chip)} \\ C = 0.022\mu F \text{ (Externally attached to Pin 40)} \end{cases}$$

(Lin, Lout) and Rin, (Rout) indicate the left- and right- channel I/O of the surround circuit.

(8) Others

“MVCA” is a VCA which adjusts the input signal level to the standard level of this IC.

“Bias” supplies the reference voltage and reference current to the other blocks. The current flowing to the resistor connecting IREF (Pin 15) with GND become the reference current.

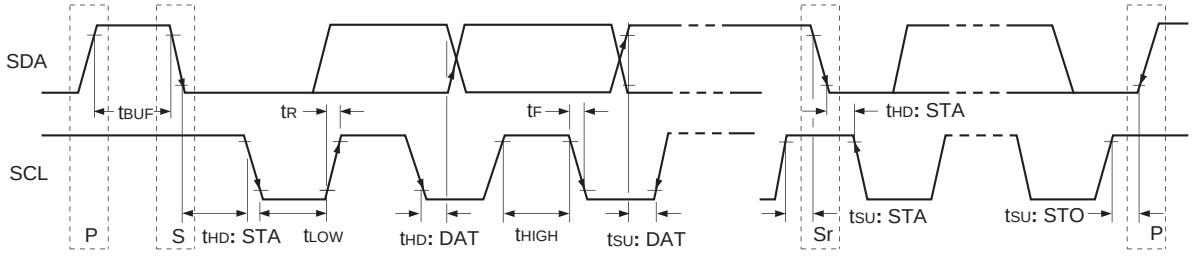
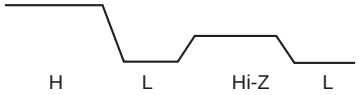
I²C Bus Control Signal



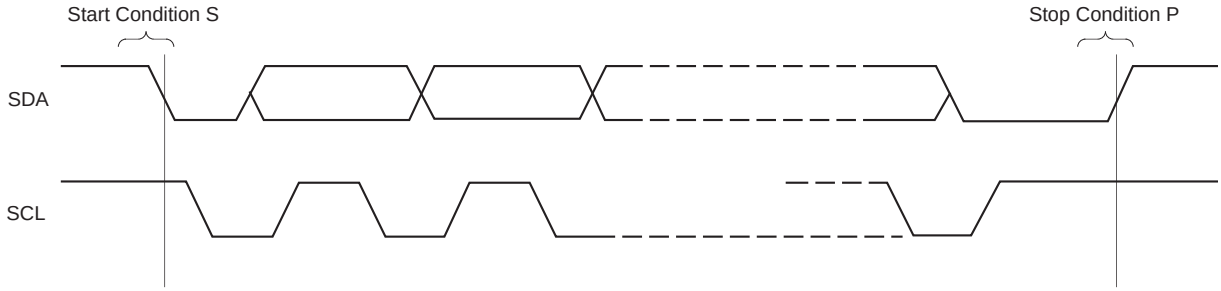
I²C Bus Signal

There are two I²C bus signals, SDA (Serial DATA) and SCL (Serial CLOCK) signals. SDA is a bidirectional signal.

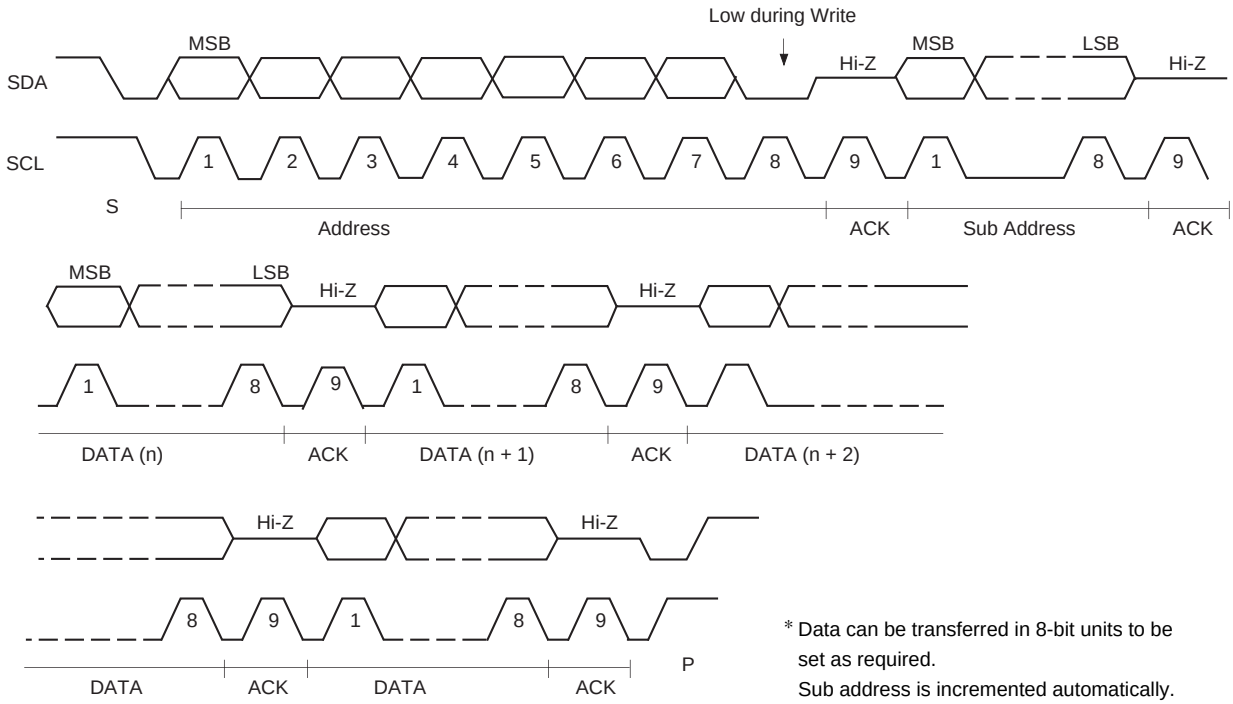
• Accordingly there are 3 values outputs, H, L and Hi-Z.



• I²C transfer begins with Start Condition and ends with Stop Condition.

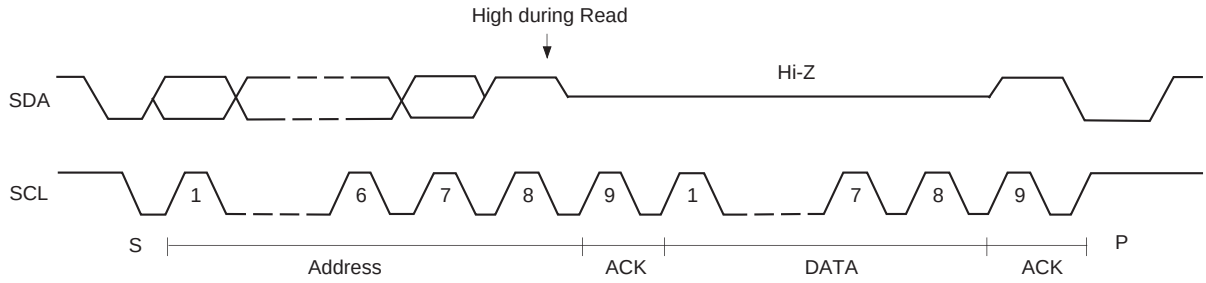


• **I²C data Write (Write from I²C controller to the IC)**

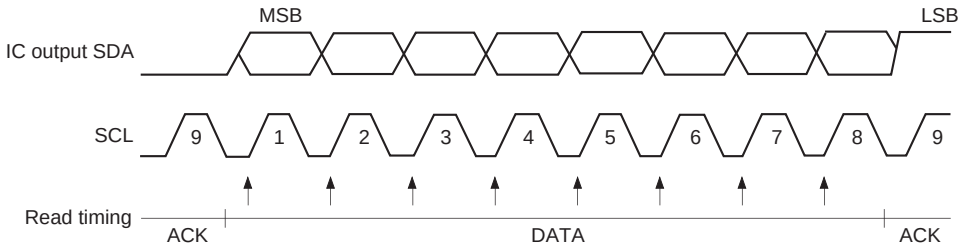


* Data can be transferred in 8-bit units to be set as required.
Sub address is incremented automatically.

• **I²C data Read (Read from the IC to I²C controller)**



• Read timing



* Data Read is performed during SCL rise.
