

EM78P156N
OTP ROM

EM78P156N

8-BIT MICRO-CONTROLLER

Version 1.2

Specification Revision History		
Version	Content	
1.0	Initial version	
1.1	Change Power on reset content	07/01/2003
1.2	Add the Device Characteristic at section 6.3	07/29/2004

Application Note

[AN-001 EM78P156N v.s. EM78P156E on the DC Characteristics](#)

1. GENERAL DESCRIPTION

EM78P156N is an 8-bit microprocessor designed and developed with low-power, high-speed CMOS technology.. It is equipped with 1K*13-bits Electrical One Time Programmable Read Only Memory (OTP-ROM). It provides three PROTECTION bits to prevent user's code in the OTP memory from being intruded. 8 OPTION bits are also available to meet user's requirements.

With its OTP-ROM feature, the EM78P156N is able to offer a convenient way of developing and verifying user's programs. Moreover, user can take advantage of EMC Writer to easily program his development code.

2. FEATURES

- Operating voltage range : 2.5V~5.5V
- Operating temperature range: -40°C~85°C
- Operating frequency rang (base on 2 clocks):
 - * Crystal mode: DC~20MHz at 5V, DC~8MHz at 3V, DC~4MHz at 2.5V.
 - * ERC mode: DC~4MHz at 5V, DC~4MHz at 3V, DC~4MHz at 2.5V.
- Low power consumption:
 - * Less then 2 mA at 5V/4MHz
 - * Typically 20 μ A at 3V/32KHz
 - * Typically 1 μ A during sleep mode
- 1K \times 13 bits on chip ROM
- One security register to prevent intrusion of OTP memory codes
- One configuration register to accommodate user's requirements
- 48 \times 8 bits on chip registers (SRAM, general purpose register)
- 2 bi-directional I/O ports
- 5 level stacks for subroutine nesting
- 8-bit real time clock/counter (TCC) with selective signal sources, trigger edges, and overflow interrupt
- Two clocks per instruction cycle
- Power down (SLEEP) mode
- Three available interruptions
 - * TCC overflow interrupt
 - * Input-port status changed interrupt (wake up from sleep mode)
 - * External interrupt
- Programmable free running watchdog timer
- 8 programmable pull-high pins
- 7 programmable pull-down pins
- 8 programmable open-drain pins
- 2 programmable R-option pins
- Package types:
 - * 18 pin DIP 300mil : EM78P156NP
 - * 18 pin SOP 300mil : EM78P156NM
 - * 20 pin SSOP 209mil : EM78P156NAS

EM78P156N OTP ROM

* 20 pin SSOP 209mil : EM78P156NKM

- 99.9% single instruction cycle commands
- The transient point of system frequency between HXT and LXT is around 400KHz

3. PIN ASSIGNMENTS

Fig. 1 Pin Assignment

Table 1 EM78P156NP and EM78P156NM Pin Description

Symbol	Pin No.	Type	Function
VDD	14	-	* Power supply.
OSCI	16	I	* XTAL type: Crystal input terminal or external clock input pin. * ERC type: RC oscillator input pin.
OSCO	15	I/O	* XTAL type: Output terminal for crystal oscillator or external clock input pin. * RC type: Instruction clock output. * External clock signal input.
TCC	3	I	* The real time clock/counter (with Schmitt trigger input pin), must be tied to VDD or VSS if not in use.
/RESET	4	I	* Input pin with Schmitt trigger. If this pin remains at logic low, the controller will also remain in reset condition.
P50~P53	17,18, 1, 2	I/O	* P50~P53 are bi-directional I/O pins. * P50 and P51 can also be defined as the R-option pins. * P50~P52 can be pulled-down by software.
P60~P67	6~13	I/O	* P60~P67 are bi-directional I/O pins. * These can be pulled-high or can be open-drain by software programming. * P60~P63 can also be pulled-down by software.
/INT	6	I	* External interrupt pin triggered by falling edge.
VSS	5	-	* Ground.

Table 2 EM78P156NAS Pin Description

Symbol	Pin No.	Type	Function
VDD	15	-	* Power supply.
OSCI	17	I	* XTAL type: Crystal input terminal or external clock input pin. * ERC type: RC oscillator input pin.
OSCO	16	I/O	* XTAL type: Output terminal for crystal oscillator or external clock input pin. * RC type: Instruction clock output. * External clock signal input.
TCC	4	I	* The real time clock/counter (with Schmitt trigger input pin), must be tied to VDD or VSS if not in use.
/RESET	5	I	* Input pin with Schmitt trigger. If this pin remains at logic low, the controller will also remain in reset condition.
P50~P53	18, 19, 2, 3	I/O	* P50~P53 are bi-directional I/O pins. * P50 and P51 can also be defined as the R-option pins. * P50~P52 can be pulled-down by software.
P60~P67	7~14	I/O	* P60~P67 are bi-directional I/O pins. * These can be pulled-high or can be open-drain by software programming. * P60~P63 can also be pulled-down by software.
/INT	7	I	* External interrupt pin triggered by falling edge.
VSS	6	-	* Ground.

Table 3 EM78P156NKM Pin Description

Symbol	Pin No.	Type	Function
VDD	15,16	-	* Power supply.
OSCI	18	I	* XTAL type: Crystal input terminal or external clock input pin. * ERC type: RC oscillator input pin.
OSCO	17	I/O	* XTAL type: Output terminal for crystal oscillator or external clock input pin. * RC type: Instruction clock output. * External clock signal input.
TCC	3	I	* The real time clock/counter (with Schmitt trigger input pin), must be tied to VDD or VSS if not in use.
/RESET	4	I	* Input pin with Schmitt trigger. If this pin remains at logic low, the controller will also remain in reset condition.
P50~P53	19, 20, 1, 2	I/O	* P50~P53 are bi-directional I/O pins. * P50 and P51 can also be defined as the R-option pins. * P50~P52 can be pulled-down by software.
P60~P67	7~14	I/O	* P60~P67 are bi-directional I/O pins. * These can be pulled-high or can be open-drain by software programming. * P60~P63 can also be pulled-down by software.
/INT	7	I	* External interrupt pin triggered by falling edge.
VSS	5, 6	-	* Ground.

4. FUNCTION DESCRIPTION

Fig. 2 Function Block Diagram

4.1 Operational Registers

1. R0 (Indirect Addressing Register)

R0 is not a physically implemented register. Its major function is to perform as an indirect addressing pointer. Any instruction using R0 as a pointer actually accesses data pointed by the RAM Select Register (R4).

2. R1 (Time Clock /Counter)

- Increased by an external signal edge, which is defined by TE bit (CONT-4) through the TCC pin, or by the instruction cycle clock.
- Writable and readable as any other registers.
- Defined by resetting PAB(CONT-3).
- The prescaler is assigned to TCC, if the PAB bit (CONT-3) is reset.
- The contents of the prescaler counter will be cleared only when TCC register is written with a value.

3. R2 (Program Counter) & Stack

- Depending on the device type, R2 and hardware stack are 10-bits wide. The structure is depicted in Fig.3.
- Generating 1024×13 bits on-chip OTP ROM addresses to the relative programming instruction codes. One program page is 1024 words long.
- R2 is set as all "0"s when under RESET condition.
- "JMP" instruction allows direct loading of the lower 10 program counter bits. Thus, "JMP" allows PC to go to any location within a page.
- "CALL" instruction loads the lower 10 bits of the PC, and then PC+1 is pushed into the stack. Thus, the subroutine entry address can be located anywhere within a page.
- "RET" ("RETL k", "RETI") instruction loads the program counter with the contents of the top-level stack.
- "ADD R2, A" allows the contents of 'A' to be added to the current PC, and the ninth and tenth bits of the PC are cleared.
- "MOV R2, A" allows to load an address from the "A" register to the lower 8 bits of the PC, and the ninth and tenth bits of the PC are cleared.
- Any instruction that writes to R2 (e.g., "ADD R2,A", "MOV R2,A", "BC R2,6",.....) will cause the ninth and tenth bits (A8~A9) of the PC to be cleared. Thus, the computed jump is limited to the first 256 locations of a page.
- All instruction are single instruction cycle (fclk/2 or fclk/4) except for the instruction that would change the contents of R2. Such instruction will need one more instruction cycle.

Fig. 3 Program Counter Organization

Address	R PAGE registers	IOC PAGE registers
00	R0 (IAR)	Reserve
01	R1 (TCC)	CONT (Control Register)
02	R2 (PC)	Reserve
03	R3 (Status)	Reserve
04	R4 (RSR)	Reserve
05	R5 (Port5)	IOC5 (I/O Port Control Register)
06	R6 (Port6)	IOC6 (I/O Port Control Register)
07	Reserve	Reserve
08	Reserve	Reserve
09	Reserve	Reserve
0A	Reserve	IOCA (Prescaler Control Register)
0B	Reserve	IOCB (Pull-down Register)
0C	Reserve	IOCC (Open-drain Control)
0D	Reserve	IOCD (Pull-high Control Register)
0E	Reserve	IOCE (WDT Control Register)
0F	RF (Interrupt Status)	IOCF (Interrupt Mask Register)
10 11 12 13 14 15 16 17 18 19 1A 1B 1C 1D 1E 1F 20 21 22 23 24 25 26 27 28 29 2A 2B 2C 2D 2E 2F 30 31 32 33 34 35 36 37 38 39 3A 3B 3C 3D 3E 3F	General Registers	

Fig. 4 Data Memory Configuration

4. R3 (Status Register)

7	6	5	4	3	2	1	0
GP2	GP1	GP0	T	P	Z	DC	C

- **Bit 0 (C)** Carry flag
- **Bit 1 (DC)** Auxiliary carry flag
- **Bit 2 (Z)** Zero flag.
Set to "1" if the result of an arithmetic or logic operation is zero.
- **Bit 3 (P)** Power down bit.
Set to 1 during power on or by a "WDTC" command and reset to 0 by a "SLEP" command.
- **Bit 4 (T)** Time-out bit.
Set to 1 with the "SLEP" and "WDTC" commands, or during power up and reset to 0 by WDT time-out.
- **Bit5 ~7 (GP0 ~ 2)** General-purpose read/write bits.

5. R4 (RAM Select Register)

- Bits 0~5 are used to select registers (address: 00~06, 0F~3F) in the indirect addressing mode.
- Bits 6~7 are not used (read only).
- The Bits 6~7 set to "1" at all time.
- Z flag of R3 will set to "1" when R4 content is equal to "3F." When R4=R4+1, R4 content will select as R0.
- See the configuration of the data memory in Fig. 4.

6. R5 ~ R6 (Port 5 ~ Port 6)

- R5 and R6 are I/O registers.
- Only the lower 4 bits of R5 are available.

7. RF (Interrupt Status Register)

7	6	5	4	3	2	1	0
-	-	-	-	-	EXIF	ICIF	TCIF

"1" means interrupt request, and "0" means no interrupt occurs.

- **Bit 0 (TCIF)** TCC overflow interrupt flag. Set when TCC overflows, reset by software.
- **Bit 1 (ICIF)** Port 6 input status change interrupt flag. Set when Port 6 input changes, reset by software.
- **Bit 2 (EXIF)** External interrupt flag. Set by falling edge on /INT pin, reset by software.
- **Bits 3 ~ 7** Not used.

- RF can be cleared by instruction but cannot be set.
- IOCF is the interrupt mask register.
- Note that the result of reading RF is the "logic AND" of RF and IOCF.

8. R10 ~ R3F

- All of these are 8-bit general-purpose registers.

4.2 Special Purpose Registers

1. A (Accumulator)

- Internal data transfer, or instruction operand holding
- It cannot be addressed.

2. CONT (Control Register)

7	6	5	4	3	2	1	0
-	/INT	TS	TE	PAB	PSR2	PSR1	PSR0

- Bit 0 (PSR0) ~ Bit 2 (PSR2) TCC/WDT prescaler bits.

PSR2	PSR1	PSR0	TCC Rate	WDT Rate
0	0	0	1:2	1:1
0	0	1	1:4	1:2
0	1	0	1:8	1:4
0	1	1	1:16	1:8
1	0	0	1:32	1:16
1	0	1	1:64	1:32
1	1	0	1:128	1:64
1	1	1	1:256	1:128

- **Bit 3 (PAB)** Prescaler assignment bit.
 - 0: TCC
 - 1: WDT
- **Bit 4 (TE)** TCC signal edge
 - 0: increment if the transition from low to high takes place on TCC pin
 - 1: increment if the transition from high to low takes place on TCC pin
- **Bit 5 (TS)** TCC signal source
 - 0: internal instruction cycle clock
 - 1: transition on TCC pin
- **Bit 6 (/INT)** Interrupt enable flag
 - 0: masked by DISI or hardware interrupt
 - 1: enabled by ENI/RETI instructions
- **Bit 7** Not used.

- CONT register is both readable and writable.

3. IOC5 ~ IOC6 (I/O Port Control Register)

- "1" put the relative I/O pin into high impedance, while "0" defines the relative I/O pin as output.
- Only the lower 4 bits of IOC5 can be defined.
- IOC5 and IOC6 registers are both readable and writable.

4. IOCA (Prescaler Counter Register)

- IOCA register is readable.
- The value of IOCA is equal to the contents of Prescaler counter.
- Down counter.

5. IOCB (Pull-down Control Register)

7	6	5	4	3	2	1	0
/PD7	/PD6	/PD5	/PD4	-	/PD2	/PD1	/PD0

- **Bit 0 (/PD0)** Control bit is used to enable the pull-down of P50 pin.
 - 0: Enable internal pull-down
 - 1: Disable internal pull-down
- **Bit 1 (/PD1)** Control bit is used to enable the pull-down of P51 pin.
- **Bit 2 (/PD2)** Control bit is used to enable the pull-down of P52 pin.
- **Bit 3** Not used.
- **Bit 4 (/PD4)** Control bit is used to enable the pull-down of P60 pin.
- **Bit 5 (/PD5)** Control bit is used to enable the pull-down of P61 pin.
- **Bit 6 (/PD6)** Control bit is used to enable the pull-down of P62 pin.
- **Bit 7 (/PD7)** Control bit is used to enable the pull-down of P63 pin.
- IOCB Register is both readable and writable.

6. IOCC (Open-drain Control Register)

7	6	5	4	3	2	1	0
OD7	OD6	OD5	OD4	OD3	OD2	OD1	OD0

- **Bit 0 (OD0)** Control bit is used to enable the open-drain of P60 pin.
 - 0: Disable open-drain output
 - 1: Enable open-drain output
- **Bit 1 (OD1)** Control bit is used to enable the open-drain of P61 pin.
- **Bit 2 (OD2)** Control bit is used to enable the open-drain of P62 pin.
- **Bit 3 (OD3)** Control bit is used to enable the open-drain of P63 pin.
- **Bit 4 (OD4)** Control bit is used to enable the open-drain of P64 pin.

- **Bit 5 (OD5)** Control bit is used to enable the open-drain of P65 pin.
- **Bit 6 (OD6)** Control bit is used to enable the open-drain of P66 pin.
- **Bit 7 (OD7)** Control bit is used to enable the open-drain of P67 pin.
- IOCC Register is both readable and writable.

7. IOCD (Pull-high Control Register)

7	6	5	4	3	2	1	0
/PH7	/PH6	/PH5	/PH4	/PH3	/PH2	/PH1	/PH0

- **Bit 0 (/PH0)** Control bit is used to enable the pull-high of P60 pin.
 - 0: Enable internal pull-high
 - 1: Disable internal pull-high
- **Bit 1 (/PH1)** Control bit is used to enable the pull-high of P61 pin.
- **Bit 2 (/PH2)** Control bit is used to enable the pull-high of P62 pin.
- **Bit 3 (/PH3)** Control bit is used to enable the pull-high of P63 pin.
- **Bit 4 (/PH4)** Control bit is used to enable the pull-high of P64 pin.
- **Bit 5 (/PH5)** Control bit is used to enable the pull-high of P65 pin.
- **Bit 6 (/PH6)** Control bit is used to enable the pull-high of P66 pin.
- **Bit 7 (/PH7)** Control bit is used to enable the pull-high of P67 pin.
- IOCD Register is both readable and writable.

8. IOCE (WDT Control Register)

7	6	5	4	3	2	1	0
WDTE	EIS	-	ROC	-	-	-	-

- **Bit 7 (WDTE)** Control bit used to enable Watchdog timer.
 - 0: Disable WDT.
 - 1: Enable WDT.WDTE is both readable and writable.
- **Bit 6 (EIS)** Control bit is used to define the function of P60 (/INT) pin.
 - 0: P60, bi-directional I/O pin.
 - 1: /INT, external interrupt pin. In this case, the I/O control bit of P60 (bit 0 of IOC6) must be set to "1".When EIS is "0", the path of /INT is masked. When EIS is "1", the status of /INT pin can also be read by way of reading Port 6 (R6). Refer to Fig. 7(a).
EIS is both readable and writable.
- **Bit 4 (ROC)** ROC is used for the R-option.

Setting the ROC to "1" will enable the status of R-option pins (P50~P51) that are read by the controller. Clearing the ROC will disable the R-option function. If the R-option function is selected, user must connect the P51 pin or/and P50 pin to VSS with a 430KΩ external resistor (Rex). If the Rex is connected/disconnected, the status of P50 (P51) is read as "0"/"1". Refer to Fig. 8.

- Bits 0~3,5 Not used.

9. IOCF (Interrupt Mask Register)

7	6	5	4	3	2	1	0
-	-	-	-	-	EXIE	ICIE	TCIE

- **Bit 0 (TCIE)** TCIF interrupt enable bit.
 - 0: disable TCIF interrupt
 - 1: enable TCIF interrupt
- **Bit 1 (ICIE)** ICIF interrupt enable bit.
 - 0: disable ICIF interrupt
 - 1: enable ICIF interrupt
- **Bit 2 (EXIE)** EXIF interrupt enable bit.
 - 0: disable EXIF interrupt
 - 1: enable EXIF interrupt
- **Bits 3~7** Not used.
- Individual interrupt is enabled by setting its associated control bit in the IOCF to "1".
- Global interrupt is enabled by the ENI instruction and is disabled by the DISI instruction. Refer to Fig. 10.
- IOCF register is both readable and writable.

4.3 TCC/WDT & Prescaler

An 8-bit counter available as prescaler for the TCC or WDT. The prescaler is available for either the TCC or WDT only at any given time, and the PAB bit of the CONT register is used to determine the prescaler assignment. The PSR0~PSR2 bits determine the ratio. The prescaler is cleared each time the instruction is written to TCC under TCC mode. The WDT and prescaler, when assigned to WDT mode, are cleared by the "WDTC" or "SLEP" instructions. Fig. 5 depicts the circuit diagram of TCC/WDT.

- R1 (TCC) is an 8-bit timer/counter. The clock source of TCC can be internal or external clock input (edge selectable from TCC pin). If TCC signal source is from internal clock, TCC will increase by 1 at every instruction cycle (without prescaler). Referring to Fig. 5, CLK=Fosc/2 or CLK=Fosc/4 application is determined by the CODE Option bit CLK status. CLK=Fosc/2 is used if CLK bit is "0", and

CLK=Fosc/4 is used if CLK bit is "1". If TCC signal source comes from external clock input, TCC is increased by 1 at every falling edge or rising edge of TCC pin.

- The watchdog timer is a free running on-chip RC oscillator. The WDT will keep on running even when the oscillator driver has been turned off (i.e. in sleep mode). During normal operation or sleep mode, a WDT time-out (if enabled) will cause the device to reset. The WDT can be enabled or disabled any time during normal mode by software programming. Refer to WDTE bit of IOCE register. Without prescaler, the WDT time-out period is approximately 18 ms¹ (default).

Fig. 5 Block Diagram of TCC and WDT

4.4 I/O Ports

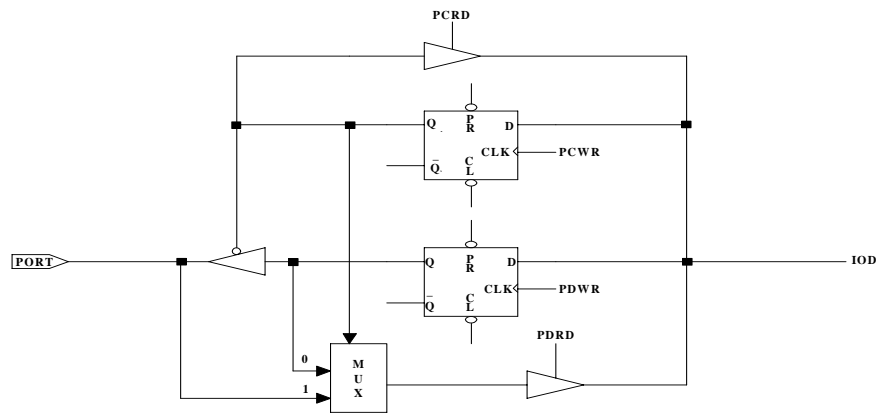

The I/O registers, both Port 5 and Port 6, are bi-directional tri-state I/O ports. Port 6 can be pulled high internally by software. In addition, Port 6 can also have open-drain output by software. Input status change interrupt (or wake-up) function on Port 6. P50 ~ P52 and P60 ~ P63 pins can be pulled down by software. Each I/O pin can be defined as "input" or "output" pin by the I/O control register (IOC5 ~ IOC6). P50~P51 are the R-option pins enabled by setting the ROC bit in the IOCE register to 1. When the

¹ <Note>: Vdd = 5V, set up time period = 16.8ms ± 30%

Vdd = 3V, set up time period = 18ms ± 30%

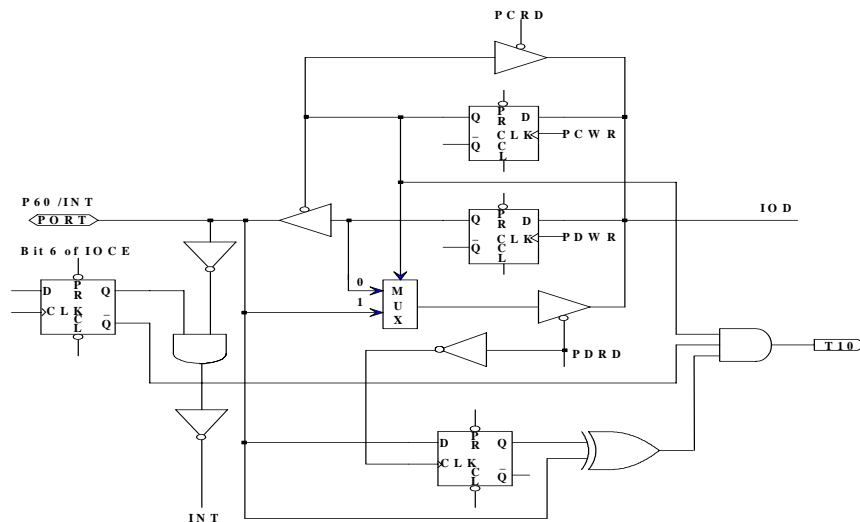

R-option function is used, it is recommended that P50~P51 are used as output pins. When R-option is in enable state, P50~P51 must be programmed as input pins. Under R-option mode, the current/power consumption by Rex should be taken into the consideration to promote energy conservation.

The I/O registers and I/O control registers are both readable and writable. The I/O interface circuits for Port 5 and Port 6 are shown in the following Figures 6, 7(a), 7(b), and Figure 8.

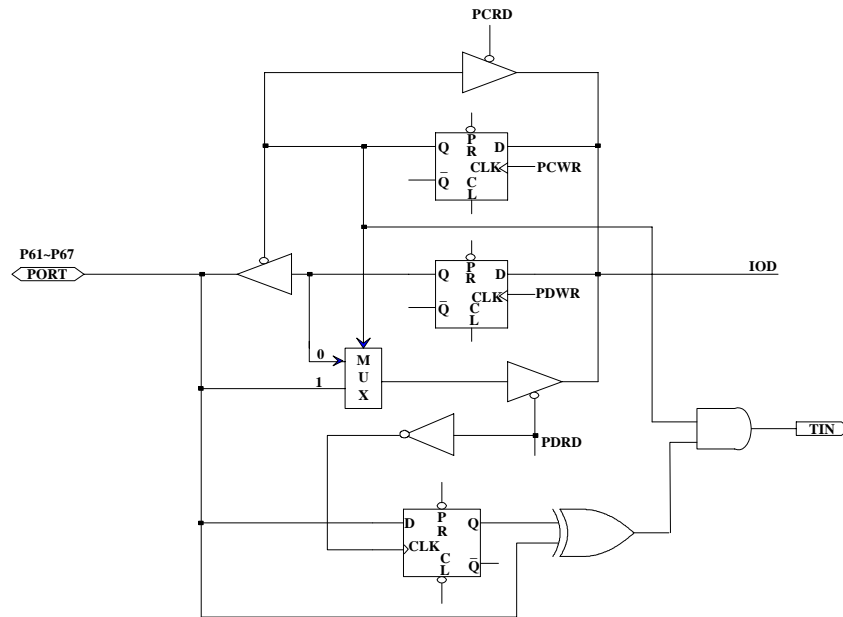

NOTE: Pull-down is not shown in the figure.

Fig. 6 The Circuit of I/O Port and I/O Control Register for Port 5

NOTE: Pull-high (down) and Open-drain are not shown in the figure.

Fig. 7(a) The Circuit of I/O Port and I/O Control Register for P60 (/INT)

NOTE: Pull-high (down) and Open-drain are not shown in the figure.

Fig. 7(b) The Circuit of I/O Port and I/O Control Register for P61~P67

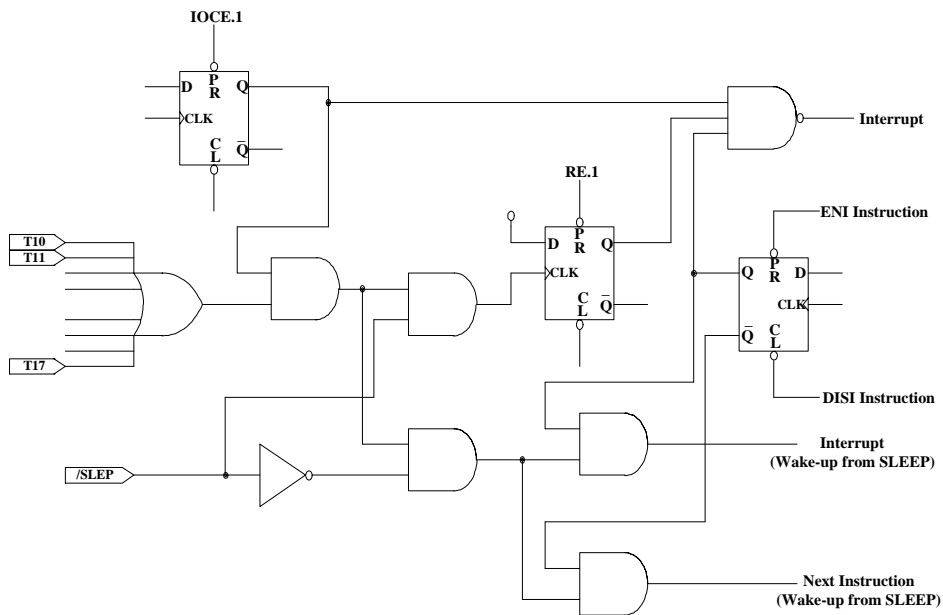

Fig. 7(c) Block Diagram of I/O Port 6 with Input Change Interrupt/Wake-up

Table 4 Usage of Port 6 Input Change Wake-up/Interrupt Function

Usage of Port 6 input status changed Wake-up/Interrupt	
<p>(I) Wake-up from Port 6 Input Status Change (a) Before SLEEP 1. Disable WDT¹ (using very carefully) 2. Read I/O Port 6 (MOV R6,R6) 3. Execute "ENI" or "DISI" 4. Enable interrupt (Set IOCF.1) 5. Execute "SLEP" instruction (b) After Wake-up 1. IF "ENI" → Interrupt vector (008H) 2. IF "DISI" → Next instruction</p>	<p>(II) Port 6 Input Status Change Interrupt 1. Read I/O Port 6 (MOV R6,R6) 2. Execute "ENI" 3. Enable interrupt (Set IOCF.1) 4. IF Port 6 change (interrupt) → Interrupt vector (008H)</p>

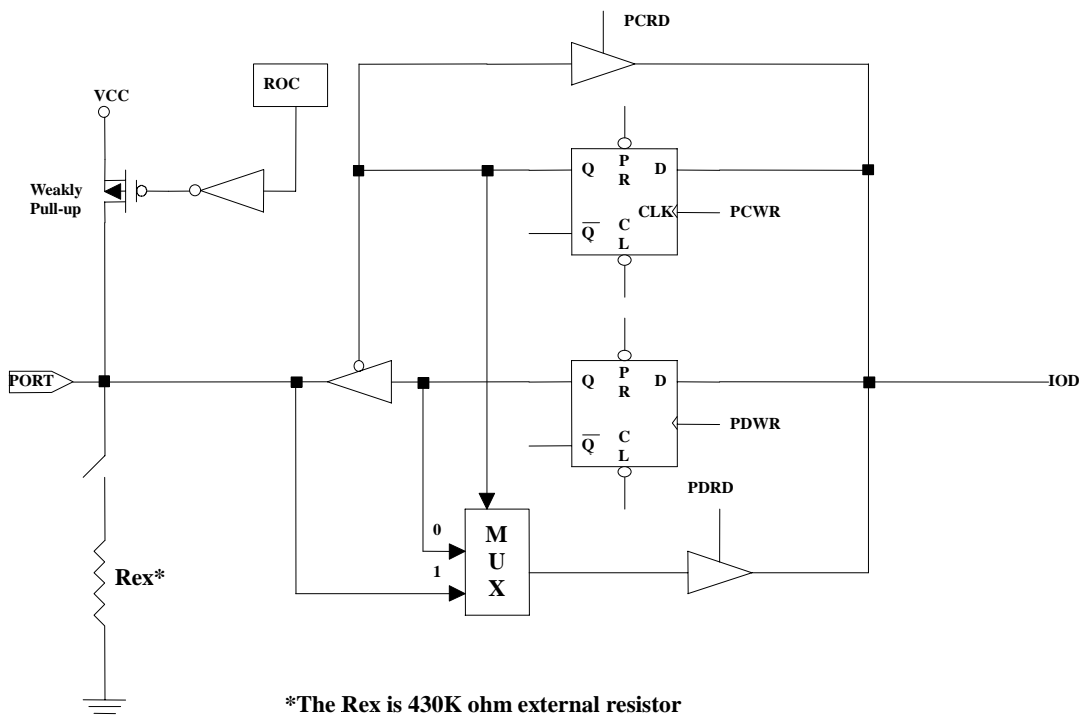

Fig. 8 The Circuit of I/O Port with R-option(P50,P51)

¹ NOTE: Software disables WDT (watchdog timer) but hardware must be enabled before applying Port 6 Change Wake-Up function. (CODE Option Register and Bit 11 (ENWDTB-) set to "1").

4.5 RESET and Wake-up

1. RESET

A RESET is initiated by one of the following events-

- (1) Power on reset.
- (2) /RESET pin input "low", or
- (3) WDT time-out (if enabled).

The device is kept in a RESET condition for a period of approx. 18ms¹ (one oscillator start-up timer period) after the reset is detected. Once the RESET occurs, the following functions are performed. Refer to Fig.9.

- The oscillator is running, or will be started.
- The Program Counter (R2) is set to all "0".
- All I/O port pins are configured as input mode (high-impedance state).
- The Watchdog timer and prescaler are cleared.
- When power is switched on, the upper 3 bits of R3 are cleared.
- The bits of the CONT register are set to all "1" except for the Bit 6 (INT flag).
- The bits of the IOCA register are set to all "1".
- The bits of the IOCB register are set to all "1".
- The IOCC register is cleared.
- The bits of the IOCD register are set to all "1".
- Bit 7 of the IOCE register is set to "1", and Bits 4 and 6 are cleared.
- Bits 0~2 of RF and bits 0~2 of IOCF register are cleared.

The sleep (power down) mode is asserted by executing the "SLEP" instruction. While entering sleep mode, WDT (if enabled) is cleared but keeps on running. The controller can be awakened by-

- (1) External reset input on /RESET pin,
- (2) WDT time-out (if enabled), or
- (3) Port 6 input status changes (if enabled).

The first two cases will cause the EM78P156N to reset. The T and P flags of R3 can be used to determine the source of the reset (wake-up). The last case is considered the continuation of program execution and the global interrupt ("ENI" or "DISI" being executed) decides whether or not the controller branches to the interrupt

¹ NOTE: Vdd = 5V, set up time period = 16.8ms ± 30%
Vdd = 3V, set up time period = 18ms ± 30%

vector following wake-up. If ENI is executed before SLEP, the instruction will begin to execute from the address 008H after wake-up. If DISI is executed before SLEP, the operation will restart from the succeeding instruction right next to SLEP after wake-up.

Only one of Cases 2 and 3 can be enabled before entering the sleep mode. That is,

[a] if Port 6 Input Status Change Interrupt is enabled before SLEP, WDT must be disabled by software. However, the WDT bit in the option register remains enabled. Hence, the EM78P156N can be awakened only by Case 1 or 3.

[b] if WDT is enabled before SLEP, Port 6 Input Status Change Interrupt must be disabled. Hence, the EM78P156N can be awakened only by Case 1 or 2. Refer to the section on Interrupt.

If Port 6 Input Status Change Interrupt is used to wake-up the EM78P156N (Case [a] above), the following instructions must be executed before SLEP:

```
MOV A, @xx000110b    ; Select internal TCC clock
CONTW
CLR R1                ; Clear TCC and prescaler
MOV A, @xxx1110b     ; Select WDT prescaler
CONTW
WDTC                  ; Clear WDT and prescaler
MOV A, @0xxxxxxb     ; Disable WDT
IOW RE
MOV R6, R6            ; Read Port 6
MOV A, @00000x1xb    ; Enable Port 6 input change interrupt
IOW RF
ENI (or DISI)         ; Enable (or disable) global interrupt
SLEP                  ; Sleep
NOP
```

One problem user should be aware of, is that after waking up from the sleep mode, WDT would enable automatically. The WDT operation (being enabled or disabled) should be handled appropriately by software after waking up from the sleep mode.

Table 5 The Summary of the Initialized Values for Registers

Address	Name	Reset Type	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

** To jump address 0x08, or to execute the instruction which is next to the "SLEP" instruction.

X: Not used. U: Unknown or don't care. P: Previous value before reset. t: Check Table 4

2. The Status of RST, T, and P of STATUS Register

A RESET condition is initiated by the following events:

1. A power-on condition,
2. A high-low-high pulse on /RESET pin, and
3. Watchdog timer time-out.

The values of T and P, listed in Table 4 are used to check how the processor wakes up. Table 5 shows the events that may affect the status of T and P.

Table 6 The Values of RST, T and P after RESET

Reset Type	T	P
Power on	1	1
/RESET during Operating mode	*P	*P
/RESET wake-up during SLEEP mode	1	0
WDT during Operating mode	0	*P
WDT wake-up during SLEEP mode	0	0
Wake-Up on pin change during SLEEP mode	1	0

*P: Previous status before reset

Table 7 The Status of T and P Being Affected by Events.

Event	T	P
Power on	1	1
WDTC instruction	1	1
WDT time-out	0	*P
SLEP instruction	1	0
Wake-Up on pin change during SLEEP mode	1	0

*P: Previous value before reset

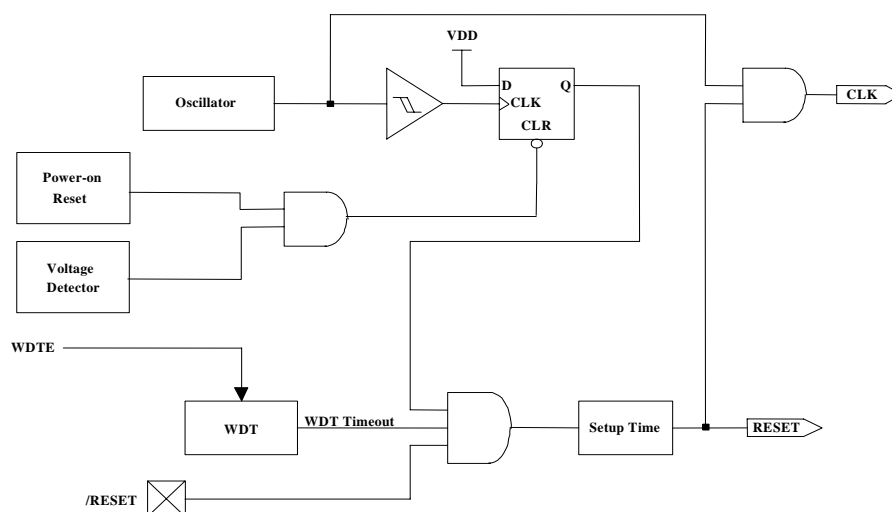

Fig. 9 Block Diagram of Controller Reset

4.6 Interrupt

The EM78P156N has three falling-edge interrupts listed below:

- (1) TCC overflow interrupt
- (2) Port 6 Input Status Change Interrupt
- (3) External interrupt [(P60, /INT) pin].

Before the Port 6 Input Status Change Interrupt is enabled, reading Port 6 (e.g. "MOV R6,R6") is necessary. Each pin of Port 6 will have this feature if its status changed. Any pin configured as output or P60 pin configured as /INT is excluded from this function. The Port 6 Input Status Changed Interrupt can wake up the EM78P156N from the sleep mode if Port 6 is enabled prior to going into the sleep mode by executing SLEEP. When the chip wakes-up, the controller will continue to execute the succeeding address if the global interrupt is disabled or branch to the interrupt vector 008H if the global interrupt is enabled.

RF is the interrupt status register that records the interrupt requests in the relative flags/bits. IOCF is an interrupt mask register. The global interrupt is enabled by the ENI instruction and is disabled by the DISI instruction. When one of the interrupts (enabled) occurs, the next instruction will be fetched from address 008H. Once in the interrupt service routine, the source of an interrupt can be determined by polling the flag bits in RF. The interrupt flag bit must be cleared by instructions before leaving the interrupt service routine and before interrupts are enabled to avoid recursive interrupts.

The flag (except ICIF bit) in the Interrupt Status Register (RF) is set regardless of the status of its mask bit or the execution of ENI. Note that the outcome of RF will be the logic AND of RF and IOCF (refer to Fig. 10). The RETI instruction ends the interrupt routine and enables the global interrupt (the execution of ENI).

When an interrupt is generated by the INT instruction (enabled), the next instruction will be fetched from address 001H.

Fig. 10 Interrupt Input Circuit

4.7 Oscillator

1. Oscillator Modes

The EM78P156N can be operated in three different oscillator modes, such as External RC oscillator mode (ERC), High XTAL oscillator mode (HXT), and Low XTAL oscillator mode (LXT). User can select one of them by programming OSC and HLF in the CODE option register. Table 6 depicts how these three modes are defined.

The up-most limited operation frequency of crystal/resonator on the different VDDs is listed in Table 7.

Table 8 Oscillator Modes Defined by OSC and HLP

Mode	OSC	HLF	HLP
ERC(External RC oscillator mode)	0	*X	*X
HXT(High XTAL oscillator mode)	1	1	*X
LXT(Low XTAL oscillator mode)	1	0	0

<Note> 1. X, Don't care

2.The transient point of system frequency between HXT and LXV is around 400 KHz.

Table 9 The Summary of Maximum Operating Speeds

Conditions	VDD	Fxt max.(MHz)
Two cycles with two clocks	3.0	8.0
	5.0	20.0

2. Crystal Oscillator/Ceramic Resonators (XTAL)

EM78P156N can be driven by an external clock signal through the OSCI pin as shown in Fig. 11 below.

Fig. 11 Circuit for External Clock Input

In the most applications, pin OSCI and pin OSCO can be connected with a crystal or ceramic resonator to generate oscillation. Fig. 12 depicts such circuit. The same thing applies whether it is in the HXT mode or in the LXT mode. Table 8 provides the recommended values of C1 and C2. Since each resonator has its own attribute, user should refer to its specification for appropriate values of C1 and C2. RS, a serial resistor, may be necessary for AT strip cut crystal or low frequency mode.

Fig. 12 Circuit for Crystal/Resonator

Table 10 Capacitor Selection Guide for Crystal Oscillator or Ceramic Resonator

Oscillator Type	Frequency Mode	Frequency	C1(pF)	C2(pF)
Ceramic Resonators	HXT	455 kHz	100~150	100~150
		2.0 MHz	20~40	20~40
		4.0 MHz	10~30	10~30
Crystal Oscillator	LXT	32.768kHz	25	15
		100KHz	25	25
		200KHz	25	25
	HXT	455KHz	20~40	20~150
		1.0MHz	15~30	15~30
		2.0MHz	15	15
		4.0MHz	15	15

<Note> 1. The value of capacitors (C1, C2) is for reference.

3. External RC Oscillator Mode

For some applications that do not need a very precise timing calculation, the RC oscillator (Fig. 15) offers a lot of cost savings. Nevertheless, it should be noted that the frequency of the RC oscillator is influenced by the supply voltage, the values of the resistor (R_{ext}), the capacitor (C_{ext}), and even by the operation temperature. Moreover, the frequency also changes slightly from one chip to another due to the manufacturing process variation.

In order to maintain a stable system frequency, the values of the C_{ext} should not be less than 20pF, and that the value of R_{ext} should not be greater than 1 M ohm. If they cannot be kept in this range, the frequency is easily affected by noise, humidity, and leakage.

The smaller the R_{ext} in the RC oscillator, the faster its frequency will be. On the contrary, for very low R_{ext} values, for instance, 1 K Ω , the oscillator becomes unstable because the NMOS cannot discharge the current of the capacitance correctly.

Based on the above reasons, it must be kept in mind that all of the supply voltage, the operation temperature, the components of the RC oscillator, the package types, the way the PCB is layout, will affect the system frequency.

Fig. 13 Circuit for External RC Oscillator Mode

Table 11 RC Oscillator Frequencies

Cext	Rext	Average Fosc 5V,25°C	Average Fosc 3V,25°C
20 pF	3.3k	3.92 MHz	3.65 MHz
	5.1k	2.67 MHz	2.60 MHz
	10k	1.39MHz	1.40 MHz
	100k	149 KHz	156 KHz
100 pF	3.3k	1.39 MHz	1.33 MHz
	5.1k	940 KHz	920 KHz
	10k	480 KHz	475 KHz
	100k	52 KHz	50 KHz
300 pF	3.3k	595 KHz	560 KHz
	5.1k	400 KHz	390 KHz
	10k	200 KHz	200 KHz
	100k	21 KHz	20 KHz

- <Note>
1. Measured on DIP packages.
 2. For design reference only.
 3. The frequency drift is about $\pm 30\%$

4.8 CODE Option Register

The EM78P156N has a CODE option word that is not a part of the normal program memory. The option bits cannot be accessed during normal program execution.

Code Option Register and Customer ID Register arrangement distribution:

Word 0	Word 1
Bit12~Bit0	Bit12~Bit0

1. Code Option Register (Word 0)

WORD 0												
Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
-	-	-	-	CLKS	ENWDTB	-	HLF	OSC	HLP	PR2	PR1	PR0

• **Bit 12** ~~Bit 11~~ ~~Bit 10~~ ~~Bit 9~~: Not used.

Reserved.

The bit set to "1" all the time.

• **Bit 8 (CLKS)**: Instruction period option bit.

0: two oscillator periods.

1: four oscillator periods.

Refer to the section on Instruction Set.

• **Bit 7 (ENWDTB)**: Watchdog timer enable bit.

0: Enable

1: Disable

• **Bit 6**: Not used.

Reserved.

The bit set to "1" all the time.

• **Bit 5 (HLF)**: XTAL frequency selection

0: XTAL2 type (low frequency, 32.768KHz)

1: XTAL1 type (high frequency)

This bit will affect system oscillation only when Bit4 (OSC) is "1". When OSC is "0", HLF must be "0".

<Note>: The transient point of system frequency between HXT and LXY is around 400 KHz.

• **Bit 4 (OSC)**: Oscillator type selection.

0: RC type

1: XTAL type (XTAL1 and XTAL2)

• **Bit 3 (HLP)**: Power selection.

0: Low power

1: High power

• **Bit 2~0 (PR2~PR0)**: Protect Bit

PR2~PR0 are protect bits, protect type as following

PR2	PR1	PR0	Protect
0	0	0	Enable
0	0	1	Enable
0	1	0	Enable

0	1	1	Enable
1	0	0	Enable
1	0	1	Enable
1	1	0	Enable
1	1	1	Disable

2. Customer ID Register (Word 1)

Bit 12~Bit 0
XXXXXXXXXXXX

- Bit 12~0: Customer's ID code

4.9 Power On Considerations

Any microcontroller is not guaranteed to start to operate properly before the power supply stays at its steady state.

EM78156N POR voltage range is 1.2V~1.8V. Under customer application, when power is OFF, V_{dd} must drop to below 1.2V and remains OFF for 10us before power can be switched ON again. This way, the EM78156E will reset and work normally. The extra external reset circuit will work well if V_{dd} can rise at very fast speed (50 ms or less). However, under most cases where critical applications are involved, extra devices are required to assist in solving the power-up problems.

4.10 External Power On Reset Circuit

The circuit shown in Fig.16 implements an external RC to produce the reset pulse. The pulse width (time constant) should be kept long enough for V_{dd} to reached minimum operation voltage. This circuit is used when the power supply has slow rise time. Because the current leakage from the /RESET pin is about $\pm 5\mu\text{A}$, it is recommended that R should not be greater than 40 K. In this way, the /RESET pin voltage is held below 0.2V. The diode (D) acts as a short circuit at the moment of power down. The capacitor C will discharge rapidly and fully. R_{in}, the current-limited resistor, will prevent high current or ESD (electrostatic discharge) from flowing to pin /RESET.

Fig. 14 External Power-Up Reset Circuit

4.11 Residue-Voltage Protection

When battery is replaced, device power (Vdd) is taken off but residue-voltage remains. The residue-voltage may trips below Vdd minimum, but not to zero. This condition may cause a poor power on reset. Fig.18 and Fig. 19 show how to build a residue-voltage protection circuit.

Fig. 15 Circuit 1 for the Residue Voltage Protection

Fig. 16 Circuit 2 for the Residue Voltage Protection

4.12 Instruction Set

Each instruction in the instruction set is a 13-bit word divided into an OP code and one or more operands. Normally, all instructions are executed within one single instruction cycle (one instruction consists of 2 oscillator periods), unless the program counter is changed by instruction "MOV R2,A", "ADD R2,A", or by instructions of arithmetic or logic operation on R2 (e.g. "SUB R2,A", "BS(C) R2,6", "CLR R2",). In this case, the execution takes two instruction cycles.

If for some reasons, the specification of the instruction cycle is not suitable for certain applications, try modifying the instruction as follows:

- (A) Change one instruction cycle to consist of 4 oscillator periods.
- (B) "JMP", "CALL", "RET", "RETL", "RETI", or the conditional skip ("JBS", "JBC", "JZ", "JZA", "DJZ", "DJZA") commands which were tested to be true, are executed within two instruction cycles.

The instructions that are written to the program counter also take two instruction cycles.

Case (A) is selected by the CODE Option bit, called CLK. One instruction cycle consists of two oscillator clocks if CLK is low, and four oscillator clocks if CLK is high.

Note that once the 4 oscillator periods within one instruction cycle is selected as in Case (A), the internal clock source to TCC should be $CLK = F_{osc}/4$, instead of $F_{osc}/2$ as indicated in Fig. 5.

In addition, the instruction set has the following features:

- (1) Every bit of any register can be set, cleared, or tested directly.

(2) The I/O register can be regarded as general register. That is, the same instruction can operate on I/O register.

The symbol "R" represents a register designator that specifies which one of the registers (including operational registers and general purpose registers) is to be utilized by the instruction. "b" represents a bit field designator that selects the value for the bit which is located in the register "R", and affects operation. "k" represents an 8 or 10-bit constant or literal value.

INSTRUCTION BINARY	HEX	MNEMONIC	OPERATION	STATUS AFFECTED

5. ABSOLUTE MAXIMUM RATINGS

EM78P156N

Items	Rating
Temperature under bias	-40°C to 85°C
Storage temperature	-65°C to 150°C
Working voltage	2.5 to 5.5V
Working frequency	DC to 20MHz*
Input voltage	Vss-0.3V to Vdd+0.5V
Output voltage	Vss-0.3V to Vdd+0.5V

*These parameters are characterized but not tested.

6. ELECTRICAL CHARACTERISTICS

6.1 DC Electrical Characteristic

(Ta=25 °C, VDD=5V±5%, VSS=0V)

Symbol	Parameter	Condition	Min	Typ.	Max	Unit
FXT	XTAL: VDD to 3V	Two cycle with two clocks	DC		8.0	MHz
	XTAL: VDD to 5V	Two cycle with two clocks	DC		20.0	MHz
ERC	ERC: VDD to 5V	R: 5.1KΩ, C: 100 pF	F±30%	940	F±30%	KHz
IIL	Input Leakage Current for input pins	VIN = VDD, VSS			±1	μA
VIH1	Input High Voltage (VDD=5V)	Ports 5, 6	2.0			V
VIL1	Input Low Voltage (VDD=5V)	Ports 5, 6			0.8	V
VIHT1	Input High Threshold Voltage (VDD=5V)	/RESET, TCC(Schmitt trigger)	2.0			V
VILT1	Input Low Threshold Voltage (VDD=5V)	/RESET, TCC(Schmitt trigger)			0.8	V
VIHX1	Clock Input High Voltage (VDD=5V)	OSCI	3.5			V
VILX1	Clock Input Low Voltage (VDD=5V)	OSCI			1.5	V
VIH2	Input High Voltage (VDD=3V)	Ports 5, 6	1.5			V
VIL2	Input Low Voltage (VDD=3V)	Ports 5, 6			0.4	V
VIHT2	Input High Threshold Voltage (VDD=3V)	/RESET, TCC(Schmitt trigger)	1.5			V
VILT2	Input Low Threshold Voltage (VDD=3V)	/RESET, TCC(Schmitt trigger)			0.4	V
VIHX2	Clock Input High Voltage (VDD=3V)	OSCI	2.1			V
VILX2	Clock Input Low Voltage (VDD=3V)	OSCI			0.9	V
VOH1	Output High Voltage (Ports 5)	IOH = -12.0 mA	2.4			V
VOH1	Output High Voltage (Ports 6) (Schmitt trigger)	IOH = -12.0 mA	2.4			V
VOL1	Output Low Voltage (Port5)	IOL = 12.0 mA			0.4	V
VOL1	Output Low Voltage (Ports 6) (Schmitt trigger)	IOL = 12.0 mA			0.4	V
IPH	Pull-high current	Pull-high active, input pin at VSS	-50	-70	-240	μA
IPD	Pull-down current	Pull-down active, input pin at VDD	25	50	120	μA
ISB ₁	Power down current	All input and I/O pins at VDD, output pin floating, WDT disabled		1	2	μA
ISB ₂	Power down current	All input and I/O pins at VDD, output pin floating, WDT enabled			15	μA
ICC1	Operating supply current (VDD=3V) at two cycles/four clocks	/RESET= 'High', Fosc=32KHz (Crystal type,CLKS="0"), output pin floating, WDT disabled	15	20	30	μA
ICC2	Operating supply current (VDD=3V) at two cycles/four clocks	/RESET= 'High', Fosc=32KHz (Crystal type,CLKS="0"), output pin floating, WDT enabled		25	35	μA
ICC3	Operating supply current (VDD=5.0V) at two cycles/two clocks	/RESET= 'High', Fosc=4MHz (Crystal type,CLKS="0"), output pin floating, WDT enabled			2.0	mA
ICC4	Operating supply current (VDD=5.0V) at two cycles/four clocks	/RESET= 'High', Fosc=10MHz (Crystal type,CLKS="0"), output pin floating, WDT enabled			4.0	mA

* These parameters are characterizes but not tested.

6.2 AC Electrical Characteristic

(Ta=25 °C, VDD=5V±5%, VSS=0V)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
Dclk	Input CLK duty cycle		45	50	55	%
Tins	Instruction cycle time (CLKS="0")	Crystal type	100		DC	ns
		RC type	500		DC	ns
Ttcc	TCC input period		(Tins+20)/N*			ns
Tdrh	Device reset hold time		11.8	16.8	21.8	ms
Trst	/RESET pulse width	Ta = 25°C	2000			ns
Twdt	Watchdog timer period	Ta = 25°C	11.8	16.8	21.8	ms
Tset	Input pin setup time			0		ns
Thold	Input pin hold time			20		ns
Tdelay	Output pin delay time	Cload=20pF		50		ns

* N= selected prescaler ratio.

* These parameters are characterizes but not tested.

6.3 Device Characteristic

The graphs provided in the following pages were derived based on a limited number of samples and are shown here for reference only. The device characteristic illustrated herein are not guaranteed for it accuracy. In some graphs, the data maybe out of the specified warranted operating range.

(Cext= 100pF, Temperature at 25°C)

Fig. 25 Typical RC OSC Frequency vs. VDD (R and C are ideal components)

Four conditions exist with the Operating Current ICC1 to ICC4. These conditions are as follows:

ICC1: VDD=3V, Fosc=32K Hz, 2 clocks, WDT disable

ICC2: VDD=3V, Fosc=32K Hz, 2 clocks, WDT enable

ICC3: VDD=5V, Fosc=4M Hz, 2 clocks, WDT enable

ICC4: VDD=5V, Fosc=10M Hz, 2 clocks, WDT enable

Fig. 27 Maximum operating current (ICC1 and ICC2) vs. Temperature

Fig. 28 Typical operating current (ICC3 and ICC4) vs. Temperature

Fig. 29 Maximum operating current (ICC3 and ICC4) vs. Temperature

Two conditions exist with the Standby Current ISB1 and ISB2. These conditions are as follows:

ISB1: VDD=5V, WDT disable

ISB2: VDD=5V, WDT enable

Fig. 30 Typical standby current (ISB1 and ISB2) vs. Temperature

Fig. 31 Maximum standby current (ISB1 and ISB2) vs. Temperature

Fig. 32 Operating voltage in temperature range from 0°C to 70°C

Fig. 33 Operating voltage in temperature range from -40°C to 85°C

APPENDIX

Package Types:

OTP MCU	Package Type	Pin Count	Package Size
EM78P156NP	DIP	18	300 mil
EM78P156NM	SOP	18	300 mil
EM78156NAS	SSOP	20	209 mil
EM78156NKM	SSOP	20	209 mil

Package Information

18-Lead Plastic Dual in line (PDIP) \times 300 mil

Quality Assurance And Reliability

Test category	Test conditions	Remarks
Solderability	Solder temperature= 245 ± 5 °C for 5 seconds to the stopper using a rosi-type flux	
Pre-condition	Step1: TCT ± 65 °C (15mins)~ 150 °C (15mins) ± 10 cycles	For SMD IC(such as SOP, QFP, SOJ...etc)
	Step2: bake 125 °C TD(durance)=24 hrs	
	Step3:soak $30^{\circ}\text{C} / 60\%$ ± 192 hrs	
	Step4:IR flow 3cycles Pkg thickness $\leq 2.5\text{mm}$ or Pkg volume $\leq 350\text{mm}^3$ ---- 225 ± 5 °C) (Pkg thickness $\leq 2.5\text{mm}$ or Pkg volume $\leq 350\text{mm}^3$ ---- 240 ± 5 °C)	
Temperature cycle test	-65 °C (15mins)~ 150 °C (15mins) , 200 cycles	
Pressure cooker test	$T_A = 121$ °C ,RH=100%,pressure=2atm, TD(durance)= 96 Hrs	
High temperature /high humidity test	$T_A = 85$ °C , RH=85% $\pm 168,500$ Hrs	
High-temperature storage life	$T_A = 150$ °C , TD(durance)=500,1000Hrs	
High-temperature operating life	$T_A = 125$ °C , VCC=Max. operating voltage, TD(durance)=168,500,1000Hrs	
Latch-up	$T_A = 25$ °C , VCC=Max. operating voltage, 150mA/20V	
ESD(HBM)	$T_A = 25$ °C , ϕ 3KV	IP_ND,OP_ND,IO_ND IP_NS,OP_NS,IO_NS
ESD(MM)	$T_A = 25$ °C , ϕ 300V	IP_PD,OP_PD,IO_PD, IP_PS,OP_PS,IO_PS, VDD-VSS(+),VDD_VSS (-)mode

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
Tpor	Power on reset time	Vdd = 5V, -40μ to 85μ	10.5	16.8	22	ms
Tvd	Vdd Voltage drop time	Vdd = 5V, -40μ to 85μ	-	-	1*	us
Tvr	Vdd Voltage rise time	Vdd = 5V, -40μ to 85μ	-	-	1**	us

* Tvd is the period of Vdd voltage less than POR voltage.

** Tvr is the period of Vdd voltage higher than 5.5 volts.

Address Trap Detect

An address trap detect is one of the fail-safe function that detects CPU malfunction caused by noise or the like. If the CPU attempts to fetch an instruction from a part of RAM, an internal recovery circuit will auto started. Until CPU got the correct function, it will execute the following program.

ELAN (HEADQUARTER) MICROELECTRONICS CORP., LTD.

Address : No. 12, Innovation 1st. Rd. Science-Based Industrial Park, Hsinchu City, Taiwan.
